As an integral part of this policy, we are dedicated to the resolution that not only must we keep out of war, but we must lead the way in actually preventing war. The means which we have adopted to this end are, first, the proclamation of our neutrality fortified by Congressional enactment; second, the adoption of a strict policy of nonintervention; and third, the agreement to pacts whose sole purpose is the outlawing of war. These are acts of our Government, but to make them effective instruments of peace the peoples of the world must be educated to the necessity and desirability of rational and sane settlement of international disputes. Public opinion should be guided to a "peace preserving and promoting" rather than to a "war avoiding" frame of mind. Then, and only then, will peace be insured to the nations, and the common aspiration for its attainment will draw people together in closer bonds of international amity and good will.

Thus, while the Oriental and European nations labor under the burdens of militarism, cling to the vicious and cruel institution of war, and raise their sons to be cannon fodder rather than peace-loving citizens, we in America stand ready to advance in the spirit of the Golden Rule, and desire nothing more than the true good will of the true good neighbor. Such a rule of conduct is an old and universal maxim, but the American Government and the American people have given it new meaning. And it is high time that the belligerent nations of the world took heed of it and helped restore its ancient and powerful meaning.

Peace and economic rehabilitation must be our objectives. The availability of the processes of democracy give the people of this Nation an unparalleled opportunity to spread the doctrines of peace, and in a world which seems again intent upon its own destruction we cannot work too hard or too long in a cause so vital to our national welfare. Our individual and combined efforts are needed for the preservation of democratic forms of government. The crisis is thus thrust upon the New World—the American republics. The Old World looks hopefully and longingly in our direction. Our common ties with them strengthen our desire to do our best in the molding and achievement of a new world order. We have the opportunity and the duty to persevere in our efforts to secure a permanent and enduring peace.

Our course is charted for us. It is our duty to see that nothing causes us to deviate from that course. We are agreed that war is a blot upon civilization, an outworn relic of barbarism, wholly unjustifiable in the light of the adequate machinery for the peaceful settlement of all disputes among nations. We must now consecrate all our efforts and emotions by concrete actions to the cause of peace. I cannot stress too strongly the need of constant, concerted efforts on the part of all serious-minded people to avoid our past mistakes. We as a Nation know the effects of the World War, and we have already paid too high a price for what we then thought was worth any cost. We are determined that this, the greatest and richest nation on the face of the globe, shall take no further part in so-called legalized murder and leave the flower of our manhood strewn upon bloody fields to no avail.

I can think of no more effective mouthpieces for the gospel of peace than the Gold Star Mothers of the World War. Into the characters of each one of you there has been ingrained an abiding sense of the futility of war. On the hearts of each one of you there has been impressed the sorrow which is known only to those who have lost loved ones on the field of battle. Into the lives and homes of all of you the angel of death has come unbidden and unwelcome—because of war.

I urge you, therefore, to hold yourselves forth to the world not only with the righteous pride of mothers who have given the greatest gifts at their disposal to their country, but also as living examples of self-sacrificing heroines who have suffered because of the selfish brutality of war. None are better qualified than you to give to America and the world the message which your Government has preached since the last war. Moreover, if the hearts of men are not altogether turned to stone, you will be heard.

If in this fashion you can bring home to the hearts and minds of men a strong sense of the uselessness of war, your brave sacrifices will not have been in vain and the future generations of American mothers will remember you with everlasting gratitude.

Thanks for Congress—Thanks for the Private Employment Still Left in America

EXTENSION OF REMARKS

OF

HON. RALPH E. CHURCH

OF ILLINOIS

IN THE HOUSE OF REPRESENTATIVES

Thursday, November 25, 1937

Mr. CHURCH. Mr. Speaker; on yesterday, after I was permitted to complete a short statement, I withdrew my objection to the Majority Leader's request to adjourn over, and so notified him long before adjournment.

I rise today, Mr. Speaker, in sincere reverence to extend my thanks that still in America we have Congress.

In the same deep reverence, Mr. Speaker, I extend my thanks that there is still left in America some private business and some private employment.

Thanks for this Congress, courageous, returned from contact with its constituency, proud of its victory last summer in saving the Constitution.

Thanks for this Congress, willing to stand on its hind legs, with the courage of its convictions, asserting its right to equal voice in this our American Government—a Congress returned to the scene of battle, to the Capital City of the greatest democracy on earth, determined to save that democracy from a self-willed ruler, who by taxation has driven millions onto the dole.

Mr. Speaker, I predict that the working men and women of this country, if they were here, would flood us with their thanksgiving, and prayers that we not stifle, but that we encourage private enterprise—by removing the tax burden from their backs and the backs of their employers, in order to give them and their brothers work—work with a decent wage instead of a dole.

They believe and they pray, Mr. Speaker, that by the orderly processes of democracy, under our Constitution, and with the spirit of Christ, all can prosper, in this great democracy of ours.

Mr. Speaker, I say, thanks for Congress, thanks for the private employment still left in America.

Tribute to America's Dead in the World War

EXTENSION OF REMARKS

OF

HON. ALLEN J. ELLENDER

OF LOUISIANA

IN THE SENATE OF THE UNITED STATES

Friday, November 26 (legislative day of Tuesday, November 16), 1937

SPEECH BY HON. CLAUDE PEPPER, OF FLORIDA, ON NOVEMBER 11, 1937

Mr. ELLENDER. Mr. President, I ask unanimous consent to have printed in the RECORD a speech delivered on November

11, 1937, at Tavares, Fla., by Senator PEPPER in tribute to America's heroic dead in the World War.

Without objection, the speech was ordered to be printed in the RECORD, as follows:

This is the eve of the day when we shall pay tribute to America's heroic dead in the World War. We come not to mourn them but to honor them. Thank God that America has such heroes to honor. Wherever they may be in sacred dust, there lies the spirit of this people. In a true sense these young men, like that young man who trod the Galilean hills, gave their lives that others might live after the high destiny of man.

Two decades ago America was called in derision a decadent nation and her people degenerate successors of a noble past. They beyond the seas who looked upon this paragon of power, the accumulation of our wealth, the vastness of our industrial system, the terrible fervor with which we entered into the business of life—a little envious, perhaps, of it all—said that America had lost her heart; that her idealism, once as pure as a baby's smile, had been consumed in the fierceness of her lusts and passions; that her instincts of freedom and love of liberty, her boasted experiment of democracy, had been blasted on the iron feet of Mammon and machine. No more did Pilgrims' feet tread this treasured land, won by countless sacrifices; no more did patriots' hearts beat in the breasts of this people whose fathers had dared to ordain this soil as the birthplace of hope, the cradle of liberty, and the home of freedom.

Then came the chaos of war, war waged with all the terrible and destructive energies of civilization and none of its refinements; war so terrible that it, like a hideous monster, opened its jaws to devour all that ages had attained or eons ennobled.

For 3 terrible, anxious years America looked upon this maelstrom aghast, unwilling to believe it possible that the twentieth century, boasting the proudest civilization of history, should be the end of it all and mark the time of man's destruction by his own hand, to leave again barren, stark, and cold the lands he had made to flow with milk and honey.

We were a nation devoted to peace; we cherished a tradition that we had never warred save for the divine right of freedom and in defense of the weak and oppressed. But this thing could not go on; it was too terrible, too horrible, too unthinkable to be endured; and, fired by the leadership of that great President who spoke with a prophet's fire and passion, who saw with a prophet's eye, America again saw ahead of her, distinct and clear as a prophet's dream, her path of duty. She would not war for war but against war. She would guarantee to generations yet unborn that never again should this monster raise its ghastly head to devour mothers' sons and loved ones' hearts. Let the sacrifice be what it might, she would not shirk. With a Christian fervor and crusader's zeal, she threw herself into the affray. Her sons came from their peaceful pursuits to the training camps, and those who in June were despised civilians, in January were the first soldiers of the earth. From her mighty machines poured in ceaseless streams the tools of war, and her financial system took on its shoulders the weight of an impoverished world. A vicarious sacrifice never seen in history's annals, save on Golgotha's Hill—a nation unloosing its terrible energies in war, not for the grandeur of a throne, not for the garlands of fame, not to expand its territory or increase its bursting wealth, but to serve an ideal, eternally to destroy the philosophy that might makes right, to keep alive in human hearts the gleam of hope and continually to refresh the fires of freedom.

What a passion did that event stir in the heart of the world! Suppressed peoples threw off the yokes of a thousand years of slavery and dreamed again visions of a nation's destiny. Races torn into warring groups by conqueror's hand saw visions of being reunited. Poets, dreamers, and philosophers, despairing of a debauched world, had kindled again in their hearts a conviction that nobler and finer things of the spirit, once thought lost beyond recovery, yet were nurtured in the human heart.

How they carried on in that struggle is the brightest gem of history, an inheritance of glory to generations yet unborn. In the face of battle, in the jaws of death they marched with a soldier's courage, a patriot's heart. A battered foe, a score of battlefields, a thousand guarded and impregnable entrenchments torn into a thousand fragments, attested with what valor they carried on, insensible of any aim save victory, heedless of death or destruction.

Grateful governments have erected shafts and mausoleums in memorium. These are the expressions that are customary in remembrance of departed heroes. But those heroes who sleep out there beneath the crosses, their remains blended with Nature's soil, or rest in sailors' graves, their souls at peace with God, and that one who sleeps beneath the Unknown Soldier's Tomb, to the steady tread of sentinels' feet, they fought not for shaft nor mausoleum; they fought for remembrance in the human heart, for memorials of gratitude in the souls of men living and generations yet to come; an inheritance of honor from generation to generation to be cherished, esteemed, and defended.

Their work is done, ours remains. They have been vindicated, we remain to vindicate ourselves. They have given us new vision, the right to entertain new hopes, a feeling of brotherhood and human responsibility before undreamed of in our individualism. They have brought into one great family the nations of the earth. They have given themselves as hostages for peace that all of man's splendid energies might be devoted to the services of his higher self. They have torn away the shackles of the mind, broken down the prejudices of eons of antiquity, and made for all mankind one common purpose to be defended, to be fought for, to be cherished by all the races of the earth.

To the men who are in the hospitals of the Nation tonight, we want you to know that your Nation—the nation of that flag which you followed, to which you gave your devotion—is thinking of you tonight and tomorrow and all days and nights to come.

We in Congress want you to know that we are trying to give you all possible care and attention and will continue to do so.

We want the veterans to know that we are trying to make provision for your families, for those you may leave behind.

And to all of you be assured that the Senate Military Affairs Committee has reported to the Senate favorably the bill sponsored by the American Legion to take the profit out of war.

How well have we who live kept the faith with those who, for us, have died? One who looks upon the international scene today sees again the fiery dragons of war dashing over the Orient and Europe, breathing death and destruction everywhere. The ditches, the fields, the swollen streams run red with human blood. Homes are destroyed, temples, cathedrals, "all that beauty, all that wealth ere gave," have come to "the inevitable hour" of death and the grave from the foul hand of war. Old jealousies have been revived, the instincts of greed have again come to guide nations' courses. The heavy hand of the dictator has fallen upon the liberties of the people and crushed them. Human hopes which, by the stimulus of the idealism of America, stood upon the peak of world moral heights in the days of 1917 and 1918 and viewed the prospect of a parliament of men, now languish in disappointment, almost in despair. Yet, with all these tragedies before us, we who look upon the scene can see that the heroic idealism of America in those war days has yet left its indelible impress upon the hearts of men. There is not a completely effective body yet, but there is a League of Nations which it is to be hoped will become an agency through which eventually international conflicts may be peacefully adjusted. But even greater in effectiveness than the League of Nations is something of imperishable, intangible force left to us by the idealists of the world of 1917 and 1918; that is to say, a world consciousness and a world conscience. Nations today whose selfish ambitions lead them to trample under unfeeling feet the rights of nations and weaker peoples find themselves, whether they like it or not, arraigned before the bar of world opinion and answerable to the world conscience for the reasonableness and the righteousness of their conduct. Today the moral forces of the earth stand unitedly for peace and decency and fair regard for the rights of others in international as well as national and personal affairs. Even dictators shall eventually tremble before the righteous wrath of outraged world opinion.

It is in this respect, therefore, that the United States can render an invaluable yet peaceful service. It was in this spirit that the President spoke at Chicago. He was Assistant Secretary of the Navy and lived close to Woodrow Wilson. Upon this experience the President said recently that he learned in those war days what to do and what not to do. He learned from the example of Woodrow Wilson how the moral force of the world can be marshaled and how effective is that force. He knows how the words of Woodrow Wilson behind the German lines did almost as much to break the resistance of the Germans in 1918 as did the allied cannon in front of those lines. In the same manner did the President in his Chicago speech appeal even over the heads of dictators to the men in the factories and in the fields, in the homes and on the seas of foreign countries for an international morality which shall condemn national wrong in the way that a wholesome public sentiment condemns and suppresses private wrong.

But let me, my friends, as a Senator from Florida and as a member of the Foreign Relations Committee of the United States Senate, tell you every one—you mothers and fathers, sons and daughters, brothers and sisters—we are not going to let this Nation get into war except it be necessary to defend at home this sacred soil against the feet of the hostile invader.

The idealism of 1917 and 1918 is alive not only in the field of international relations but in the national life of the United States. Our Nation was founded upon the principle of a liberty under law which could be found in no land under the sun. That aspiration for an ordered liberty found its security in the contents of our organic, constitutional law. By the provisions and the assurances of that organic law, under the protection and the inspiration of those guaranties which have come to us from generations ahead of us and which we are determined to hand down equally sacred and unsullied, equally pure and undefiled, to generations yet to come, we have reached in our history great moral heights in our national course. Yet there has never been a time when the conscience of America was so sensitive to social wrong as now. There has never been a period when the heart of this Nation was so sympathetic to the need of the indigent, the physically and mentally handicapped, and the spiritually depressed as in the period since the 4th of March 1933. There has never been an era in which the righteous wrath of the social conscience has turned with more and sterner vigor upon him who would oppress and destroy his fellow man than in this era when the spiritual idealism of Franklin D. Roosevelt has inspired this Nation's course. A hundred thousand indigents upon new hospital beds, tens of thousands of crippled children restored to normal bodies, endless

lines of old men and women, sad eyed and poverty stricken, who have received old-age assistance, the blind, whom a sympathetic Government has taken by the hand, widowed mothers with dependent children, who have found succor and support, those suffering from tuberculosis who have found refuge at such splendid hospitals as the one which we have just opened in Orlando—these countless thousands give their eloquent testimony to an American idealism which is not only abroad but at home, in Nation, State, county, and city.

We have learned a lesson in cooperation, in what we can do for our fellow man to lighten the load of toil upon his back, to give him a better home, a more stable income, better health conditions, and a more secure place in the social order. And yet along with that humanitarianism—with that principle of helping the man on the way to Jericho—we have also learned that in such cooperation there is a greater personal gain. For in helping the man at the bottom of the economic ladder to be more prosperous we build a prosperity which shall insure a greater prosperity for all. In strengthening the weak places in the fabric of our national life we give the whole cloth a strength which it did not have before. So just as we still yearn for a day of international peace, when war shall be no more, when men shall settle their national differences in peaceful tribunal as they do now their private differences, we yearn also for a time when groups in national life can live peacefully with competitive groups, when interests will dwell amicably with conflicting interests, and when the common aspiration shall be the common good, the welfare of all.

Thus do these objectives challenge our generation. Back to us from those heroes of 1917 and 1918, as they sleep in Flanders fields and on the bottom of the seas, comes a message of reminder in matchless song, clear as a bugle call:

"In Flanders fields the poppies blow,
Between the crosses row on row
That mark our place, and in the sky
The larks still singing bravely fly
Scarce heard amid the guns below.

"We are the dead. Short days ago
We lived, felt dawn, and sunset glow,
Loved and were loved, and now we lie
In Flanders fields.

"Take up our quarrel with the foe;
To you with falling hands we throw
The torch, be yours to hold it high;
If ye break faith with us who die
We shall not sleep, though poppies grow
In Flanders fields."

Let this occasion be one of those which shall in immortal print engrave on the hearts of all peoples, and particularly of the citizenry of this Nation, the refrain of the deathless song of remembrance:

"Lord God of Hosts, be with us yet,
Lest we forget, lest we forget."

Newly Mined Domestic Silver and Its Relation to Agriculture

EXTENSION OF REMARKS

OF

HON. EDWIN C. JOHNSON

OF COLORADO

IN THE SENATE OF THE UNITED STATES

Friday, November 26 (legislative day of Tuesday, November 16), 1937

RADIO ADDRESS BY HON. ELBERT D. THOMAS, OF UTAH, ON NOVEMBER 26, 1937

Mr. JOHNSON of Colorado. Mr. President, I ask unanimous consent to have printed in the RECORD an able and interesting radio address delivered today by Senator THOMAS of Utah on the subject of Newly Mined Domestic Silver and Its Relation to Agriculture.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

The Senate is discussing an agriculture bill and I am asked to discuss a Presidential Executive order regulating the price of newly mined domestic silver. Immediately you ask, What is the connection? Is there a relation between the two? My answer definitely is "Yes."

There are about 20 States in the American Union entirely dependent upon agriculture. There are several States which are very complex industrially or occupationally speaking. There are States like the great States of the West, sparsely settled, where stock raising and mining are the chief means of gaining a livelihood. There are States, like my own, which have great mines, but which are predominantly agricultural and which also have ranges and forests and several industries which have to do with the products of the mines, the range, and the forests.

Thus my State in a small way represents the complexities of the whole Nation. We have a laboring population; we have a farming population; we have an industrial population. We have the industrial, the professional, and the banking class, none of which thrives, though, unless all thrive. Agriculture is dependent upon mining because it is the laboring man in the mine and smelting camps who is the consumer of our farm products. The cities thrive only when profits from the field, the mine, and the range are obtainable. Our best-paid laboring classes are the men who work in the mines and the smelters and for the transportation companies which carry the products of the hills and the mountains to the cities and the great manufacturing centers.

Thus definitely a Presidential Executive order dealing with the price of silver does affect agriculture. If our mines are running, if our smelters are going at full blast, if labor is being fully paid, then the farmer and the stockman thrive. Therefore less money is spent for relief and fewer people are on the relief rolls.

Probably without exception the Executive order placing the price of newly mined domestic silver above the world price has done more to keep and to put more men to work and to keep from the relief rolls more men and women than any other single effort of our Government since it started seriously in 1933 to cope with the problems of the depression. And in addition to this the Government—not only the Federal but also the State and the county—has gained much in taxes as a result of this aid to newly mined silver. And in addition to that, too, the Federal Government itself has realized a profit from the product purchased. For every 77.57 cents expended, it has received $1.29 worth of dimes, quarters, half dollars, and dollars.

You ask how that can be done. Under our present money bill, the President is authorized, within certain bounds, to place by proclamation the price of gold and of silver. He is instructed to purchase silver on the world market. He has followed the custom—a very good one indeed—of differentiating between silver obtainable on the world market and newly mined domestic silver. This differential was brought into our money scheme primarily to put men to work, and it has put to work and kept working since the President's first proclamation anywhere from a half million to a million persons, thus providing for the maintenance from labor of several million people. This labor has produced wealth. This labor has consumed the products of the factories and field. This labor has paid taxes. This labor has allowed boys and girls to return to school. This labor has made it possible for closed schools to reopen and run full time. This labor has brought a restoration of decent pay for teachers, for store clerks; and this labor has kept the economic machinery of many Western States in a prosperous condition. When the West profits, the whole country benefits.

But, you say, it must be impossible for one little proclamation to do all this. It would be impossible if our economic life were not so interdependent. You ask, "How can it be that silver is the key to the activity of the mining life of the West?" The answer is a simple one to those who understand metal mining. It is a difficult one to those who are not familiar with metal mining in the West.

Silver is generally found in conjunction with other metals, seldom alone. It is mined from the same rock in which copper, zinc, and lead are found. These coarser metals used in industry can be mined profitably only when the prices are good. The minute copper, for instance, falls below 7 cents a pound, or zinc or lead below 4 cents a pound, copper, zinc, and lead mines have to close because it costs more than that to operate them. But if in a ton of rock taken from a copper or a lead or a zinc mine there can be found from 5 to 8 ounces of silver at the present price of newly mined domestic silver, one can readily see that the copper, zinc, and lead mines can be kept running, even if the commodity prices are down, if the silver content and the price of silver are high enough to cover the losses on copper, zinc, and lead. Now, as most of our mines in the West are mines producing more than one metal, it can thus be seen that the great copper mines and smelters are kept running and kept running profitably with the small allowance given to silver. Our great zinc and lead mines, too, can remain open and their products stored awaiting a better price, providing silver helps to pay the cost of operation. Thus, without offering a subsidy to copper, or to zinc, or to lead, the gross metal products required in our industrial life, the slight aid to silver makes the mining possible and keeps thousands of men at work.

But, you say that the Government is paying too much for this. I have stated above that the Government makes a profit, an actual money profit, on the seigniorage which it charges for coining the newly mined domestic silver, a charge which is too great, all things being considered, but which the mine producers do not object to because they realize that in time and the working out of our present money legislation ultimately the silver price will be high and silver universally used as money. The aid given newly mined American silver is merely a legal recognition of what is an economic fact. For there is an economic difference between newly mined American silver and ordinary silver purchased in the world market.

The amount of silver produced as a result of this aid given to newly mined American silver cannot be estimated, but we do know how much money the Government has used in the purchase of newly mined domestic silver since the President's first proclamation. It is in the neighborhood of $112,000,000 ($112,705,000).

For this $112,000,000, the United States actually has one-hundred-and-eighty-odd million dollars' (approximately $187,600,000) worth of dimes, quarters, halves, and dollars. Thus from the expenditure of $112,000,000 the Government made a profit of about $75,000,000 worth of dimes, quarters, halves, and dollars, and the taxes derived by the Federal and the State Governments as a result of the activity in the mines has more than compensated for the purchase. This simple aid has brought to Government easily double its cost.

Looked at simply as a relief measure, may I repeat what I said in the beginning, what other action of the Government has paid so well? And yet not a cent of this money paid for newly mined domestic silver has been used as a dole or for a make-work project. Every man who has gone back to work has been employed on the regular industrial basis.

I would not, though, allow it to be assumed that I am justifying the President's Executive order solely on the basis of putting men to work. That is sufficient justification, to be sure, and it is enough to grant a continuation of the present silver program. But the program has a bigger and greater meaning not only to national monetary practice, but also to world-wide recovery and money stabilization. While many nations of the world, forced through economic circumstances and the exhaustion of war and the depression, are resorting to many different forms of managed currency, America is building a monetary base for money and controlling it in such a way that monetary inflation would be almost impossible even were it attempted. America is also controlling this base in such a way that the moment world moneys become stabilized she can start the free flow of gold and silver over the world, and be able to redeem in specie upon immediate demand. The present money policy of our Government is not only giving us the soundest money that America has ever had or known but also by this policy America is preparing the way for world stabilization and redemption on demand whenever the time becomes auspicious.

We must never forget that the capitalistic system has been able to be maintained only in those places where there has been an even flow of gold and silver, and that the individual has been assured lasting accumulated profits from his labors only in those lands where and at those times when his profits have been readily convertible into either gold or silver. Let no man be so economically foolish as to assume that individual wealth can last unless it can be readily converted into something that is universally recognized and into something which will freely be exchanged no matter where it is. So far in the history of the world the only two commodities which have always been acceptable are the two precious metals. Excess wealth in land cannot be transported. Excess wealth in products of the field and the farm is destroyed by overabundance or too much surplus. Excess wealth in property is dependent upon too many factors. Gold and silver are the two commodities that have been recognized throughout history in periods of depression, in periods of prosperity, in periods of peace, and in periods of war. America's monetary strength today is assured as long as she keeps her money based upon gold and silver. Let it never be forgotten by all Americans that if America goes off a metal-base money and adopts what has been adopted in other countries through force of necessity, a strictly managed currency system, internationally speaking, the measure of American wealth will be the mass of American labor as it is compared with the mass of labor in other countries.

Therefore that nation which is nearest the ultimate consumer and which has the greatest abundance of surplus labor and which has the cheapest labor will have all the advantage; and that nation would not be America, because the United States of America has of all the great nations the least surplus labor. She is the farthest from the ultimate consumer and her labor costs are the highest. It is only by our continued use of metal money that we can compete with the rest of the world. These are the plain facts of history; these are the plain facts of our American economic life today. Dispute them, if you will; but disprove them, you cannot.

We have then in our great and continuously growing gold and silver monetary base that which, to me, and I know to you, is definitely worth retaining—the surest guaranty of the preservation of American democracy.

Conferences Between the President and Utility Officials

EXTENSION OF REMARKS

OF

HON. GEORGE W. NORRIS

OF NEBRASKA

IN THE SENATE OF THE UNITED STATES

Friday, November 26 (legislative day of Tuesday, November 16), 1937

ARTICLE FROM THE WASHINGTON EVENING STAR

Mr. NORRIS. Mr. President, I ask unanimous consent to have printed in the RECORD an article appearing in today's Washington Star commenting on the conferences that have been held between the President and utility magnates. The article is written by Joseph Alsop and Robert Kintner.

There being no objection, the article was ordered to be printed in the RECORD, as follows:

[From the Washington Evening Star of November 26, 1937]

THE CAPITAL PARADE—LEFT-WING PRESIDENTIAL ADVISERS SEEM TO HAVE WON BATTLE ON APPROACH TO DEPRESSION

(By Joseph Alsop and Robert Kintner)

In a struggle as intense as the one now in progress between the right- and left-wing Presidential advisers, no secret keeps very long. Too many people are too personally interested in the struggle's outcome, on which will depend the whole administration approach to the problem of the depression. Therefore, the real story of the recent Presidential conferences with utility executives, which marked the first round of the struggle, is already on its way through the administration's whispering galleries.

The conservative White House advisers hoped that the conferences would be the first step on the road to an administration peace with the utilities companies. They had strongly urged conciliation on the President on the double grounds that a peace with the utilities would soothe the present panic fears of business, and that it would encourage the utilities themselves to spend hundreds of millions of business-stimulating dollars on construction work.

Therefore, three things stick out of the real story of the conferences like so many sore thumbs:

1. The President made no peace offer to the utilities executives.

2. A peace program was brought down by at least one of the utilities executives, Wendell L. Willkie, of the Commonwealth & Southern Co.; and, although the Willkie program involved such concessions as a general write-off of $1,400,000,000 in the national utilities capitalization, and future acceptance of the President's "prudent investment" theory of rate making, the President seemed to pay little or no attention to it.

3. The President devoted considerable time to lecturing the utilities men, blaming them for unreasonable terror, and arguing that, in spite of the Government competition sponsored by T. V. A. and the other things which have upset the utilities business, there was no excuse in the world for their hesitant attitude toward new investment.

The first and most important of the conferences—that with Mr. Willkie—must have been downright funny. The utilities man, rather naturally, went to it hoping to see an olive branch or so waved in his direction. As the story comes from the most reliable Washington whispering galleries, he found instead a slightly contentious President, with Frank R. McNinch, the able power expert, who now heads the Federal Communications Commission, there to support the Presidential contentions.

The President opened up by asking just how much construction spending Mr. Willkie thought the utilities could do in the next year. Mr. Willkie replied that he thought $1,200,000,000 was a fair guess, but added that unless the utilities companies were convinced that the administration was no longer hostile the guess would have to be around $1. Mr. McNinch then revised Mr. Willkie's guess to $1,500,000,000.

Then the President wanted to know just what percentage of the total power produced in this country came from publicly owned plants. Mr. Willkie thought 12 percent. Mr. McNinch said 10. Finally the President asked what percentage of the population could be served by publicly owned power plants. Mr. Willkie thought 22 percent. Mr. McNinch said 18.

Taking the McNinch figures as his text, the President proceeded to his lecture, which must be taken as the key to his attitude on the importance of conciliating business until evidence to the contrary is produced.

He said roundly that the great majority of the utilities in the country were not and could not be affected by the Government competition which they cried out against.

To all this Mr. Willkie replied that the reasonableness of the utilities' attitude was not the important question. He argued in his turn that the attitude was there, that it could only be cured by an adjustment in the relations between the companies and the Federal Government, and that in view of the advancing depression some adjustment was vital.

He then presented his peace program. Its first two points were concessions, smaller than the critics of the utilities have wanted but larger than the utilities have been willing to make hitherto.

First, he suggested that the utilities accept without dispute all the charges of write-ups in their capitalization preferred up to the present by the Federal Trade Commission.

Second, he proposed that the capitalization having been adjusted in this fashion, all increases in the rate base by new investment be hereafter calculated on the "prudent investment" system, rather than by "reproduction cost", as in the past.

The concessions he asked for in return were, first, that the death-sentence clause of the Holding Company Act should be modified, so that, while all intermediate holding companies would be eliminated from the utilities structures within 3 years, the top holding companies would still be left in control of their operating properties.

And second, he asked that a number of changes be made in the administration of the T. V. A., all intended to minimize the threat of Government competition with the private companies, to remove the inequities charged to Government competition by the private

companies, and to insure the utilities an opportunity to sell their existing properties when public ownership of distribution lines is desired.

The President listened to the program in silence and made no special comment on it after it had been presented. The meeting broke up with pious hopes on both parts that some agreement might be reached, but without any concrete step of any sort in that direction.

The second conference, with Floyd L. Carlisle, of the Consolidated Edison, ended with Mr. Carlisle professing satisfaction in his talk with the President and promising to try to start a construction program with his company's funds, but actually it was not much different from the first.

Thus the President's left-wing advisers, whose views were almost exactly echoed by the President in his talks to the utilities men, seem to have won by a clear knockout in the first round of their fight for dominance in the approach to the depression.

Earl Godwin Discusses the Proposed Referendum on Participation in Foreign Wars

EXTENSION OF REMARKS

OF

HON. LOUIS LUDLOW

OF INDIANA

IN THE HOUSE OF REPRESENTATIVES

Thursday, November 25, 1937

RADIO ADDRESS BY EARL GODWIN, OF THE WASHINGTON TIMES, ON NOVEMBER 23, 1937

Mr. LUDLOW. Mr. Speaker, Earl Godwin, of the Washington Times, brilliant radio commentator whose discussions of public topics are heard and enjoyed by millions, chose as his subject for a broadcast day before yesterday the resolution I have introduced—House Joint Resolution No. 199—which proposes to amend the Constitution so that those who have to do the dying and the suffering and to bear the indescribable burdens and griefs of war shall have a vote on participation in foreign wars.

If the amendment I propose is adopted our national defense will not be in any way, sense, or degree impaired, but the people shall have a right to say whether the blood of our boys shall redden the soil of foreign countries in the settlement of quarrels of alien origin.

There is a demand coming from all over the country for the adoption of this constitutional amendment, and if enough Members of Congress sign a petition I have filed at the Speaker's desk (Discharge Petition No. 11) the peace measure I propose will be brought up for consideration and a vote.

In his stirring address Mr. Godwin described the situation in respect to this proposed constitutional amendment as follows:

In Congress yesterday a significant thing occurred. It happened off the main legislative highway, as it were, * * * and whether the Ludlow plan for a referendum of the people before we declare war is wise or not * * * it now has so much support in the Nation and in Congress that to me it is one more indication of the return of democratic independence in the law-making body, which is the heart of a true democratic government. * * *

I think it is wise * * * but there are so many men who know so much more about government than I do I would certainly not put myself up against any of these, our great lawmakers and officials who seem to take it as a personal insult that the making of war should be taken out of officials' hands. * * * The boys who go to war should not be given any part in saying yes or no to the negotiations which lead them to the trenches. * * * They know so little. * * * And they would know even less if they depended on some sections of government to find out just what is going on as to war. * * *

Under the Constitution, Congress declares war. * * * The Ludlow resolution, amends the Constitution so that a Congressional declaration of war must be backed by a referendum of the people. * * *

The Ludlow resolution has been gaining national strength over the years. * * * It now has millions of supporters in the country. * * * has almost enough Members of the House endorsing it to bring it out on the floor and debate it. * * * A total of 191 members have signed a petition giving it the right of way * * * needs 27 more. * * * LOUIS LUDLOW received permission under a special rule yesterday to speak about his bill * * * and he certainly did talk. * * * LOUIS is a great character. * * * We know him so well * * * because he was a newspaper reporter who stepped down from the press gallery to take a seat in the House several terms back. * * * He represents Indianapolis. * * * When he was first elected he was the only Democrat to defeat a sitting Republican * * * and he's been coming back regularly * * * doing a swell job. * * *

LOUIS LUDLOW to me represents the ideal type of democratic lawmaker * * * he listens to the voice of inspiration * * * that inner wisdom which we all might as well admit now and stop being embarrassed about religious faith. * * * Because a resurgence of that method of gaining wisdom in Congress is what is going to restore the proper balance between the people and their representatives here. * * *

Well, all that Louis suggests is that the people be given a chance to say "yes" or "no" about war * * * and that we embark on no aggressive war without a vote of the people. * * * It seems to me to be the most powerful suggestion made in Congress since the days of the crisis of 1860. * * * It contains the first tremendous new sweep of democracy in our lifetime. * * * And yet we find many leaders of the House and administration against the idea. * * * For sincere reasons, too * * * for instance DAVID J. LEWIS, silver-haired Congressman representing the Sixth Maryland * * * many of you listening to me now are in LEWIS' district. * * * LEWIS opposes LUDLOW's plan * * * because LEWIS is so thoroughgoing a pacifist he does not think a referendum on war * * * will offer any protection. * * * Apparently Mr. LEWIS thinks somehow, some day, we can wipe out war * * * and there will be no need for any method of declaring war. * * *

Still and all * * * I welcome this return to real democracy at a moment when we are likely to grow gradually into a government with the power all at the top * * * simply because we are so nationally lazy we give all our power to the President * * * and then run off and play golf * * * while the President assumes all the responsibility and all the power. * * * If that happens in America it is our own fault. * * *

Electricity For Every Farm Home At the "Yardstick" Rates

EXTENSION OF REMARKS

OF

HON. JOHN E. RANKIN

OF MISSISSIPPI

IN THE HOUSE OF REPRESENTATIVES

Monday, November 29 (legislative day of Thursday, November 25), 1937

SPEECH DELIVERED BY HON. JOHN E. RANKIN, OF MISSISSIPPI, BEFORE THE STATE MEETING OF THE OHIO FARM BUREAU FEDERATION AT COLUMBUS, OHIO, ON THURSDAY, NOVEMBER 18, 1937

Mr. RANKIN. Mr. Speaker, under permission granted me to extend my remarks in the RECORD, I insert below a copy of an address which I delivered before the State meeting of the Farm Bureau Federation at Columbus, Ohio, on Thursday night, November 18, 1937.

There were 7,000 farm men and women present, the largest crowd it has ever been my good fortune to address on an occasion of this kind, and the intense interest which they manifested in the subject of rural electrification further convinced me that this is one of the greatest questions, if not the very greatest question, now confronting the farmers of America.

The address follows:

Mr. Chairman, ladies, and gentlemen, I first wish to thank my distinguished friend, Mr. Lincoln, for his gracious introduction, and to congratulate him and the Farm Bureau Federation of Ohio for the great work they are now doing to bring cheap electricity to the farmers of your State.

I assure you that nothing could afford me more pleasure or give me a greater inspiration than to stand before this magnificent audience on this auspicious occasion and address you on one of the greatest economic questions of this age—electricity for every farm home at the "yardstick" rates.

Some of you may wonder why I came to speak to you tonight when the Congress is in session. In an unguarded moment last summer I promised Murray Lincoln to attend this convention and address you on this occasion; otherwise I would not be here. At that time I did not know that we would have an extra session. I have made it a rule not to leave Washington when Congress is in session. I am told the RECORD shows that I am the only man who ever served in either House of Congress from the first Continental Congress to the present day, who answered every single

roll call for 10 consecutive years. [Applause.] From 1922 to 1932 I never missed a single roll call, even on a point of no quorum. Some of my colleagues have said that it was unnecessary to try to be present when no serious business is being considered, but Holy Writ tells us to watch as well as pray, and there never was a group who needed watching worse than did that crowd in Washington during those years. [Laughter.]

The farmers of this country have heard so much about electricity that I am confident they have come to feel a good deal like the old colored man down in Mississippi who got lost one night in a thunderstorm. He was trying to follow a path by the flashes of lightning, but he would tremble with fright as the thunder crashed about him. He wasn't getting along very fast and the storm was getting worse. He didn't know just what to do. In his bewilderment it occurred to him that he had better pray. About the time the notion struck him the lightning struck a tree pretty close by and shivered it into splinters. He dropped down on his knees and said, "Oh, Lawd, I rekin you knows whut you is doin'. I spec you knows mo' 'bout whut's bes' in a case like dis den I does, but ef it means all de same to you, I'd be powerful glad ef you would gimme less racket and mo' light." [Laughter.]

I am sure the time has come when the farmers who are clamoring for electricity are expecting less racket and more light. [Applause.]

As I have said before, electricity is the lifeblood of an advancing civilization. The cheaper its rates, the more freely it flows, and the more freely it flows the greater are its benefits to mankind. It is the greatest servant humanity has ever known, and the only one the poor man or the poor woman can afford, and then only when the rates are reasonable. It is the purest commodity on the market today. It does not matter whether it is generated by wood, coal, water power, gas, or corncobs, it is always the same—pure and undefiled. It cannot be polluted. It cannot be corrupted. It cannot even be watered, or diluted in any way; although some people often succeed in watering the stock of the corporation that generates and distributes it.

It is not only the cheapest servant on earth, but it is the safest and surest one. It obeys implicitly the will of the Master, and will work in a dozen, or a hundred different places at the same time—even while we sleep.

There is nothing degrading about electricity; its every impulse is purifying and elevating, and there is enough of it for us all, as I will show in the course of these remarks.

Electricity is something new under the sun, so far as its use by man is concerned. Throughout uncounted centuries, Almighty God wrote His name in fire across the face of the storm cloud. His thunders issued a challenge to mankind to come and investigate that great mystery which humanity mistook for the wrath of God. Yet man, in his ignorance and in his stupidity, stood with fear and trembling, or fled in terror, before that terrible, awe-inspiring, scintillating, and sometimes death-dealing apparition.

About 200 years ago, Benjamin Franklin, experimenting with his key and kite, unlocked that ancient mystery of the storm cloud, brought down from the lightning's flash an electric spark and revealed to the world a new energy that was destined to change the civilization of mankind. And even then it took humanity more than 150 years to take advantage of that greatest of all discoveries.

A little more than 50 years ago, Thomas A. Edison, probably the greatest inventive genius of all time, inserted a loop of wire into a vacuum tube and generated into it a spark of electricity, thereby creating the first electric light, the first incandescent lamp. When he did that, he did more to change the course of civilization than has any other man who ever lived in all the tide of time. He illuminated this earth and made it to mock the starry splendor of the skies. He gave us the light that lights our halls and our homes, our streets and our highways, our automobiles and our passenger trains. But that is not all; he give us the spark that fires the gas that makes the motor machine possible. He made possible the automobile, the radio, the X-ray, the airplane, and the submarine. He made possible our new system of overland transportation, and enabled us through the X-ray to see through objects that were formerly supposed to exclude all light. He made possible the radio that eliminates time and space, taught us to navigate the air, and enabled us to roam with safety on the bottom of the seas. And that is not all. He made possible that great wealth of industrial machinery that has made possible our system of mass production, and lightened the burdens of men engaged in industrial toil. Yet that is not all. He made possible that great multiplicity of electrical appliances that add so much to the comforts and conveniences of our homes, and lifts from the shoulders of struggling men and women the great weight of drudgery under which they have labored since the beginning of time. In other words, he made possible this great electric civilization into which we are now moving, the like of which mankind had scarcely dreamed.

What we are trying to do is to give to the average man and woman, to every man and every woman, the benefits of this great progress. That is what we are driving at in our efforts to have electricity generated, transmitted, and distributed to every home and every business establishment in America, at the yardstick rates, or rates based upon the cost of production, transmission, and distribution.

There is enough hydroelectric power in our navigable streams and their tributaries to electrify every home in America, whether in the city, in the town, or on the farm, and to electrify every business establishment in this great country and then probably have enough left to run all the industrial machinery of the Nation.

Throughout ages past and gone, this great wealth of hydroelectric power has been running waste and wanton to the sea. It is the greatest natural resource in all the world outside of the soil from which we live, and if properly utilized will add to the comforts, happiness, and prosperity of every human being under the flag.

There are two schools of thought with reference to the power in these navigable streams. One of them takes the position that it is private property and should be used by private interests for private gain. That is the attitude of the majority of private power companies. That is the attitude of those great holding companies, and super-holding companies that are siphoning money out of the pockets of every consumer of electric energy by imposing unjust and unreasonable rates. The other school believes that the power in these streams is public property, national wealth that belongs to all the American people and should be used for the benefit of all. I belong to that school of thought, and I believe that a vast majority of the American people will agree with me when they understand the facts.

I live within less than 100 miles of Muscle Shoals. I would rather have that great dam situated that close to the people I represent, and they have access to the power generated there, than to have the dam destroyed and replaced by the diamond mines of Golconda. I would rather have that one dam situated that close to the people I represent and they have access to the power at the yardstick rates than to see it destroyed and an oil field discovered covering that entire section of the country. I would not exchange it for all the gold mines of Alaska or South Africa, if I knew that it could never be replaced. An oil field, a gold mine, or a diamond mine, enriches a few, impoverishes many, and demoralizes all, and when it is exhausted it leaves a wrecked and depleted country.

This power enriches everybody, and demoralizes none. It contributes to the happiness and well-being of all. Its every impulse is uplifting, and it is there for generations, aye for centuries to come.

It is inexhaustible. We are not exhausting a natural resource by using this water, but, on the other hand, we are conserving a natural resource and making it to serve many different purposes. In addition to generating electricity, we are controlling floods, improving navigation, and conserving the soil from which we live.

A great drive is now being made by selfish interests of the Nation against the Tennessee Valley Authority, and against its yardstick rates. What they are after is to destroy that yardstick to prevent you from getting electricity at what it is worth, at rates you can afford to pay.

A recent article in the Saturday Evening Post attacking the Tennessee Valley Authority said that every American citizen was a stockholder in the T. V. A. It went ahead to say what you had put into it, but intimating that you had not gotten anything out of it. There could never have been a more flagrant misrepresentation of a great and successful undertaking. The T. V. A. is the most profitable investment the American people have ever made. It pays for itself several times every year that rolls around in reduced light and power rates to the masses of the American people. The savings on light and power last year, as compared with the rates they would have paid in 1932, before the creation of the T. V. A., amounted to $556,000,000. During the year ending February 28, 1932, we used 62,653,000,000 kilowatt-hours of electricity, for which we paid $1,803,000,000. During the year ending February 28, 1937, we used 91,555,000,000 kilowatt-hours, for which we paid $2,086,080,300. If we had paid the same rate for that 91,555,000,000 kilowatt-hours that we paid in 1932, the year before the T. V. A. was created, the cost would have been $2,642,000,000, or $556,000,000 more than we actually paid.

Every individual who turns an electric switch in his home or in his place of business has received a part of that reduction, because we have forced rates down in every State in this Union. You are still overcharged more than a billion dollars a year, and the power interests are making a frantic drive to prevent bringing these rates down to a proper level and supplying electricity to the American consumers at reasonable rates such as the yardstick provides.

The people of the State of Ohio are overcharged for electric energy $50,488,261 a year. If they received their power at the yardstick rates, as they have a right to do, they would save $50,488,261 a year, and you would double the consumption of electricity in a year or two and thereby double the savings, to say nothing of the benefits you would derive from the increased use of electricity and the employment of additional electrical appliances.

You are being overcharged more than $50,000,000 for electric lights and power, and yet the average farmer in your State receives no electricity at all. If I had my way, we would build a high-power line from the Norris Dam, on the Tennessee River, to Columbus, Ohio, lay T. V. A. power down here at the yardstick rates, and distribute it to the farmers in every community in your State. That would not only reduce the burdens of the present consumers of electricity but it would double the values of the farm lands in Ohio. You people are just as much entitled to cheap electricity as are the farmers in the South or the far West. Some people tell you that such a line should not be built for the reason that power will be developed on the Ohio River. But you could be using this power in the meantime and could switch over to the Ohio River when the dams on that stream are completed. But they tell you this is too far to transmit electric energy, and that such a line would not be feasible. My answer to that is that we are generating power at Boulder Dam, on the Colorado River, and transmitting it 266 miles to Los Angeles, Calif., where it is laid

down wholesale for less than 4 mills a kilowatt-hour, and it loses only 6 percent in traveling that 266 miles.

A line directly from Norris Dam to Columbus, Ohio, would be less than 266 miles long. Electricity can easily be transmitted, according to the Army Engineers, 350 miles. A line 350 miles long from Norris Dam would reach almost to Toledo, on the Great Lakes. A line of sufficient voltage to transmit this power to Columbus from Norris Dam could be built for something like $6,000,000, and would reduce the electric light and power rates to the people of Ohio more than twice that amount the first year, with the possibility of increasing those reductions to where they would amount to more than $50,000,000 a year for the present consumers of electric energy in your State.

There are three principal steps in producing and distributing electric energy—generation, transmission, and distribution. Hydroelectric power can be generated, as a rule, for about 2 mills a kilowatt-hour or less. The report of the Army engineers for 1930 stated that power could be generated at Muscle Shoals at a cost of 1.352 mills, or approximately 1½ mills, a kilowatt-hour. At Boulder Dam power is being generated at 2⁷⁄₁₀ mills a kilowatt-hour. Power is being generated and sold at wholesale for a profit by private interests at the Conowingo Dam on the Susquehanna River in Pennsylvania for 2⁷⁄₁₀ mills a kilowatt-hour. Now, since this power is transmitted from Boulder Dam to Los Angeles and laid down for 4 mills a kilowatt-hour, it proves conclusively that the transmission cost is not more than 2 mills a kilowatt-hour; and, remember, that the entire investment at Boulder Dam is to be amortized over a period of 50 years by the sale of power alone. The Board of Army Engineers to which I have referred showed that power could be generated at Muscle Shoals and transmitted 300 miles at a cost of 2.625 mills a kilowatt-hour. Since it only costs 1.352 mills to generate it, it would cost less than 2 mills a kilowatt-hour to transmit it the 300 miles. Therefore, it can be easily seen that this power can be transmitted from Norris Dam and laid down in Columbus, Ohio, at something like 4 or 5 mills a kilowatt-hour.

We are buying it laid down in Tupelo, Miss., my home town, about 100 miles from the Muscle Shoals Dam, and paying on an average of 4.9 mills a kilowatt-hour. We own our own distribution system and are distributing that power to the people of the city at T. V. A. yardstick rates, which are as follows:

Three cents a kilowatt-hour for the first 50 kilowatt-hours per month.

Two cents a kilowatt-hour for the next 150 kilowatt-hours per month.

One cent a kilowatt-hour for the next 200 kilowatt-hours per month.

Four mills a kilowatt-hour for the excess over 400 kilowatt-hours per month.

Last year our distribution system paid into the city treasury in lieu of taxes $9,546.64; gave to the city to pay on its investment $4,390.03; paid interest on our bonds to the amount of $1,906.09; paid off maturing bonds to the amount of $5,911.39; and still had a net profit of $26,235.66. At the same time the people of Tupelo, a small town of 8,000, saved $349,000 on their light and power bills, compared with what they would have paid under the old rates in force before the T. V. A. was created.

Only about 30 percent of the domestic consumers of electricity throughout the United States have electric refrigerators. In Tupelo it has climbed to 88 percent. Think of it, 88 percent of the domestic consumers of electricity in that town now use individual electric refrigerators. The uses of other electrical appliances such as ranges, electric irons, heaters, etc., have increased in proportion. This bears out my statement that the cheaper the rates the more freely electricity flows, and the greater benefits it brings to the ultimate consumer.

But the greatest phase of this program is that of rural electrification—providing cheap electricity for the farm home.

Some years ago I was speaking in the State of Ohio when one of your leading citizens made a statement to me that I will never forget as long as I live. He was lamenting the fact that some of the best farm homes in Ohio were being sold under the hammer, homes were being foreclosed and people were leaving the farms and moving to the cities where they might find employment and enjoy some of the comforts and conveniences of life. He said that a short time prior to our conversation he was traveling down the old highway on which he was reared and he saw those magnificent old country homes falling to ruin—homes from which had come the great men and great women of Ohio. He said he stood in front of the one in which he was reared and took inventory. The fields were laid waste, the fences were gone, and the barn was falling down. The house was empty, the doorsteps had disappeared, and the veranda was caving in. The yard and garden had grown up with weeds and brambles. He said he walked in through what had once been an open gate and peered through the paneless window into a room that had once contained a happy fireside and saw the rats and mice chasing each other across the vacant floor, while from the dying top of a shade tree in the yard in which the birds once sang, and beneath which the children had played, a lonely crow looked out over the desolate landscape and solemnly croaked his mournful message to his mate.

He was describing the conditions of the farm homes in every State in this Union. The agricultural people were being destroyed. The economic conditions were making it impossible for them to live and pay their debts and taxes and enjoy a reasonable measure of the comforts and conveniences of life.

I thought of Goldsmith's lines:

> "Ill fares the land, to hastening ills a prey,
> Where wealth accumulates and men decay.
> Princes and lords may flourish or may fade,
> A breath can make them, as a breath has made;
> But a bold peasantry, their country's pride,
> When once destroy'd can never be supplied."

Our people were leaving the farms in those days and crowding into the cities. Today the picture has changed; our farmers have nowhere else to go; the cities are filled to overflowing; and white-collared men are filling the bread lines or crowding the relief rolls. Our farmers have their backs to the wall. Where they are living now their children will live for the next 500 years. We must do something to improve their conditions and to make their homes more pleasant, more profitable, and more attractive. We can do that by electrifying every farm home at the T. V. A. yardstick rates.

Owing to the fact that we have to go to the additional expense of building rural distribution lines, we add 1 cent a kilowatt-hour up to 100 and make the rates to the farmers as follows:

Four cents a kilowatt-hour for the first 50 kilowatt-hours a month.

Three cents a kilowatt-hour for the next 50 kilowatt-hours a month.

Two cents a kilowatt-hour for the next 100 kilowatt-hours a month.

One cent a kilowatt-hour for the next 200 kilowatt-hours a month.

Four mills a kilowatt-hour for the next 1,000 kilowatt-hours a month.

We can electrify every farm home in Ohio and practically every other State in the Union at these rates, just as we are doing throughout the immediate Tennessee Valley area. More farm homes have been electrified in the district which I represent within the last 3 or 4 years than in probably any other district in the United States. Nothing that has ever been done has added so much comfort, so much light and hope, or relieved so much drudgery as the electrification of these farm homes at these rates. We are taking to the farmer everything to be found in the city except the noise, the smoke, and the city taxes. We are giving him every convenience to be found in the congested centers and doubling the value of his home. I want to see us do the same thing for the farmers of every community in America. When we do we will make this the richest and most prosperous nation the world has ever seen.

Some time ago I saw a little woman in one of these old run-down farm homes, out in the yard, doing the family washing. Conditions in that home had gone from bad to worse until it reminded one of Shakespeare's expression, "unfenced desolation." This little woman was standing by the side of a large pot of boiling water pushing the clothes down in it with a long stick. She had three or four children around her. She wasn't over 30 years old, yet she looked to be 50. She would take those clothes out of the pot and put them in a tub of hot water and then bend down over them and scrub them until it looked as if she would fall. Then she would lay them up on a block and take what they call a "battling stick," and it looked to me as if she was beating all the buttons off. I imagine she sat up at night and sewed them back on—while she rested.

I saw that home a few months later. A rural power line had been built out to it. It had been electrified. That little woman looked 20 years younger. Even the old man had woke up and cut the weeds and painted the house. It looked like a new place. Through the Electric Home and Farm Authority they had been able to buy certain electrical appliances, among which was a washing machine. She could now put the clothes in that machine, close the lid, turn one switch, and go on about her other household duties. In a couple of hours those clothes were washed and hanging on the line. The cost of running the electric washing machine to do the washing for a family of five for 1 whole year at the T. V. A. yardstick rates was less than $1. A water pump had been installed which gave them running water all through the house. They had an electric iron and electric refrigerator. As she showed me through the home and pointed out these various appliances and conveniences, she said: "We have just begun to live."

I remember when we were debating this subject in Congress, one Member who was opposing my position said that "if the gentleman from Mississippi had his way we would build power lines to all the farm homes in the country," and, he said, "What effect would it have? The first thing a farmer would do would be to buy a radio." He thought that was ridiculous. I said that, of course, he would buy a radio; if he didn't, his wife would make him get one. Why shouldn't a farmer have a radio? Nothing brings so much joy, so much wholesome entertainment, so much music, so many good speeches, so many good sermons, or so much news into a farmer's home as a radio. One woman said to me that one of the greatest things about their radio was that it helped them to keep their children at home and entertain them in their own house.

The radio keeps a farmer informed. Probably that's what some people don't want. A year or two ago an old farmer came to town one morning and one of the young men on the street said to him, "You've come to town to get the news, have you?" He looked at

the young fellow a minute and said, "No, son; I've come to bring it. I got it before you woke up." [Laughter.] That is something for the opposition to think about. The farmers are becoming better informed today than they have ever been before, and when we get every farm home electrified and a radio in every farmhouse, the rural people of this country will come back into their own as the dominating force in the life of this Republic.

As I said a few minutes ago, the farmers of this country have nowhere else to go. They are going to have to improve their own homes and their own surroundings for the occupation of their children. Our young people in the farming districts have been rushing through school to get away from home. Where this program has been carried out, that situation is entirely reversed. They are now rushing through school to get back home. We are building for the future—laying a foundation for a grander day when the farmers of this country will occupy a higher place in the social, economic, and political affairs of this Nation, and will enjoy "a more abundant life."

Wherever we construct these rural power lines, I have urged that every schoolhouse be electrified and that a room be set aside and equipped with electrical appliances so that one of the teachers can instruct the children in their use. I especially want them to learn to read the meter, before they attempt to learn to read Greek and Latin. We have let the other fellow read the meter too long now.

We are just in the beginning of this program. We are lagging far behind other countries. Only about 10 percent of our farmers have electricity in their homes, while even Japan has 90 percent of her farms electrified. Norway, Sweden, Denmark, France, and Germany all have electricity in 90 percent of their farm homes, while in Holland and Sweden they have reached approximately 100 percent.

I should like to see $100,000,000 provided for rural electrification next year, to be allocated equitably to the people of the various States. It will all be repaid in time and will repay the Nation a hundredfold in increasing the national wealth and adding to the Nation's prosperity.

When we shall have developed all the hydroelectric power in our navigable streams, and provided for its transmission to every section of the country, when we shall have distributed that power to the farm homes of the Nation, we will have given them something that will last throughout all time to come. We will have laid the foundation for the building of the real America in which our people will enjoy the blessings of the greatest civilization the world has yet known. We will have stored up for our children and our children's children a treasure that moths and rust will not corrupt nor thieves break through and steal. [Applause.]

Relationship of Federal Government to Education

EXTENSION OF REMARKS

OF

HON. F. RYAN DUFFY

OF WISCONSIN

IN THE SENATE OF THE UNITED STATES

Monday, November 29 (legislative day of Tuesday, November 16), 1937

RADIO ADDRESS OF HON. ELBERT D. THOMAS, OF UTAH, ON THE WEEKLY PROGRAM OF THE OFFICE OF EDUCATION OF THE DEPARTMENT OF THE INTERIOR, NOVEMBER 26, 1937

Mr. DUFFY. Mr. President, I ask unanimous consent to have printed in the RECORD a brief address delivered by the Senator from Utah [Mr. THOMAS] over the National Broadcasting System on November 26, 1937, relative to legislation affecting education.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

Our task in guiding an educational measure through the Senate is one of seeing to it that those habits of thought and of action which have grown out of our American system of government shall be preserved.

Federal governmental theory has for its primary purpose the preservation of local institutions and privileges and the development of national institutions where the interests of all the people are a common concern. Thus throughout 150 years the American Government in general has evolved around the theory that those things which are of primary local concern shall be preserved in the States and in the communities, while those things which are of common concern to all shall be given over to the Federal Government. For example, Indian affairs, and therefore Indian schools, are of general interest, so that the Federal Government from the beginning has had control of the Indian schools; and education in the Territories, after the creation of the Northwest Territory, became a concern of the whole Government instead of any one State.

The American educational scheme has grown up around certain great fundamental theories: First, that the home shall have a place in it; second, that the proper relationship between the church and the state shall be maintained; and, third, that the national and local sphere shall be preserved. Thus we see that our great educational fundamentals reflect those principles of the American democracy which are fundamental to it. While it is left to the individual States to prescribe the educational programs for the States, the Federal Government must present and maintain the ideals, for if the National Government, which represents all of the States, shall lag behind, the States themselves might become backward in their attitudes toward the importance of maintaining the educational scheme. It is well that that institution which represents the whole shall be an example to those institutions which represent only a part, but it is only an example that we seek, for never should the weight of the whole be used in such a way against the will of the part that the Federal Government should attempt to dictate either policy or attitude. If this were done, one of the most important factors which tend to preserve the republican form of government in our States, which is, of course, a constitutional guaranty to the States, might be destroyed.

The States are responsible for the education of their people. Therefore the Federal Government must not encroach upon State privileges and responsibilities. In the evolution of our Federal system more and more we have discovered that the best welfare of all the people is attained by a partnership between the States and the Nation, rather than by an antagonistic contest between the two. Thus, in the sixties of the last century the plan for the creation of the great land-grant colleges came into existence. Cooperative action between the States and the Nation followed.

It will be seen, therefore, from these few remarks that the problem of education in America is not a simple one but a complex one, but in the aims the problem becomes very simple, because all of the jurisdictional entities are aiming at the same end; that is, the welfare of the men, women, and children of America. All the following are our concern: The furtherance of adult education, education for handicapped and underprivileged persons, special education in vocational lines for those who are anxious to find a place in industry, and the educational aspects of such institutions as the C. C. C. and the Army and the Navy, whose primary purposes are not educational.

In our great relief programs members of the Educational Committee feel that if these programs rest upon strong educational bases and purposes there will be more done constructively toward the upbuilding of American citizenry. The future growth of America depends upon a trained citizenry. The fundamental aim of all of our educational endeavor, be it in the State or in the Nation, is for character building in the individual and the promotion of political morality in the Nation.

Crop Control Favored By Tobacco Men

EXTENSION OF REMARKS

OF

HON. AUGUSTINE LONERGAN

OF CONNECTICUT

IN THE SENATE OF THE UNITED STATES

Monday, November 29 (legislative day of Tuesday, November 16), 1937

ARTICLE FROM HARTFORD COURANT

Mr. LONERGAN. Mr. President, I ask unanimous consent to have printed in the RECORD an article from the recent issue of the Hartford Courant, headed "Crop Control Favored by Tobacco Men."

There being no objection, the article was ordered to be printed in the RECORD, as follows:

[From the Hartford (Conn.) Courant.]

CROP CONTROL FAVORED BY TOBACCO MEN—NEW ENGLAND GROWERS' DIRECTORS TAKE UNANIMOUS ACTION BUT NO SPECIFIC BILLS ARE MENTIONED

The directors of the New England Tobacco Growers' Association Saturday afternoon unanimously voted to go on record favoring bills now before Congress "to provide an adequate and balanced flow of the major agricultural commodities in interstate and foreign commerce and for other purposes."

Though neither the Flannagan bill now before the House, nor the Pope-McGill bill which pends in the Senate, were incorporated by name in the motion, it was understood that the action was to embrace them and any other measures that might be introduced the purpose of which is to regulate the production of basic agricultural commodities so that the farmer will receive prices on a parity with those received by other economic groups.

VOTE ON CUBAN IMPORTS

Meeting for 2 hours in the Hartford County Building, the directors also took a unanimous stand on the tariff on Cuban tobacco imports. For their motion they took bodily the third point of the National Grange agricultural program for 1938 that was adopted this week at Harrisburg, Pa. "Agriculture," this phase of the program reads in part, "should be given equal protection with labor and industry under the tariff, and those reciprocal trade treaties which are harmful to the farmer should be repealed."

While there was expression of an inclination to ride the fence on the question, the general sentiment was friendly to the bills before Congress. The principal difficulties, the directors observed, have been in keeping prices uniform.

Belaboring the present economic system as unethical, unmoral, "cockeyed to the worst degree," and one in which the dominating idea is to "get all you can, regardless of how you get it," H. F. Farnham, a director from East Windsor Hill, warned the meeting that "each group has to look out for itself."

"A bill of this kind," he went on, alluding to the Pope-McGill measure, "makes it possible for the farmer to put his house in order. It requires a certain amount of police supervision to enforce the rules on the non-cooperating minority." This group, he assured his listeners, is very small.

Presiding at the meeting was George A. Peckham of Suffield, president of the association.

Agricultural Relief

EXTENSION OF REMARKS

OF

HON. BENNETT CHAMP CLARK

OF MISSOURI

IN THE SENATE OF THE UNITED STATES

Monday, November 29 (legislative day of Tuesday, November 16), 1937

LETTER FROM THE PEMISCOT COUNTY AGRICULTURAL CONSERVATION COMMITTEE, OF CARUTHERSVILLE, MO., ON THE SUBJECT OF THE PENDING AGRICULTURAL BILL

Mr. CLARK. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD a letter addressed to me by the Pemiscot County Agricultural Conservation Committee, of Caruthersville, Mo., on the subject of the pending agricultural relief bill.

There being no objection, the letter was ordered to be printed in the RECORD, as follows:

CARUTHERSVILLE, MO., *November 26, 1937.*

Senator BENNETT C. CLARK,
Washington, D. C.

DEAR SENATOR CLARK: It is the opinion of the majority of the cotton producers in Pemiscot County that the percentage of cultivated land in cotton and the percentage of production by quotas will not coincide. Goals should be made to counties on production and prorated to individual cotton farms within a county on a percentage of land in cultivation. We approve the provision in Senate bill 2787, page 35, line 19, of 5 acres per family but desire it to include 5 acres for each family on the farm.

We unanimously agree that any cotton crop control program is unsound that does not consider the most profitable method and localities for the the production of cotton. The history of Pemiscot County shows there is and has been for the past several years a large migration of cotton farmers from the old Cotton Belt to this new-drained alluvial soil of Pemiscot County. As an example, in 1930 the census shows that we had 206,000 tillable acres and the year 1937 shows that we have approximately 244,000 tillable acres, showing a raise of 38,000 acres in tillable soil for which we have no base. The increase in acreage and production in this alluvial drained swampland in the past 7 years shows definite provisions of the economic trends in cotton production in Pemiscot County.

And that under any control program adopted, an adequate quota nationally, both in acres and pounds, be allocated to each State in this drained swampland opened up for cultivation. By an adequate quota is meant for each State an acreage equal to the 1937 planted acreage plus such acreage as was diverted under the 1937 conservation program and a yield per acre equal to the average of 1933 to 1937.

That State and county committees be granted sufficient authority to assign and adjust county and individual bases within the State quota so as to protect the farmer who has cooperated with the present program and to effect a fair and equitable distribution of acreage and production among the several counties of each State and the individual farmers in each county.

The Pemiscot County S. C. D. A. Committee has contacted a great number of cotton producers and they, with the committee, have discussed at great length the merits and demerits of this bill and we want to especially extend to you our sincere thanks for your interest in sending us a copy of the bill and a request for the data that we are enclosing for your information.

We are sending a copy of this data to Senator TRUMAN and Representative ZIMMERMAN.

As it is a matter of life and death with us in Pemiscot County we urge you to support these recommendations. Don't forget, Senator, that cotton represents the largest cash crop in the whole State of Missouri.

Very truly yours,

CHAS. W. REED, JR.,
Chairman,
J. SAM EDWARDS,
Vice Chairman,
Pemiscot County Agricultural Conservation Committee.

A Right-About-Face Deserving of Approval

EXTENSION OF REMARKS

OF

HON. CLARE E. HOFFMAN

OF MICHIGAN

IN THE HOUSE OF REPRESENTATIVES

Monday, November 29 (legislative day of Thursday, November 25), 1937

Mr. HOFFMAN. Mr. Speaker, the press of November 24 quotes Gov. Frank Murphy, of Michigan, as saying:

We should all strive with one accord to preserve the advance we have made. With business conditions at present causing concern, and with facilities provided for peaceful settlement of disputes, there is no adequate excuse for taking violent or extreme measures to redress minor grievances.

Both the management and workers should have a sense of responsibility about avoiding summary action that might aggravate conditions.

What we need right now is stability in employment and business. The worker needs this as much as the employer does. While the rights of workers must be respected and guaranteed, businessmen must have freedom of management and assurance that they can operate without frequent and unwarranted interruptions.

Otherwise, as a matter of safety, they must avoid large commitments and curtail operations. When this happens, business slows down, unemployment results, workers and their families suffer reduction or stoppage of income, and trade stagnates.

POINTS TO LAST WINTER'S TROUBLE

Last winter, with business at high tide, the people of Michigan passed through a critical period of labor unrest and happily emerged without loss of life or sacrifice of political liberty. With other conditions favorable, business was able to withstand the resulting disturbance. Our difficulties then were due largely to lack of effective organization and definite governmental authority to deal with labor disputes.

Conditions have changed since last winter. In large measure intelligence and reason have been substituted for the rule of force in the solution of labor troubles. The right of workers to organize and bargain collectively has now been definitely affirmed. Through agreements entered into by their own organizations and because of new governmental agencies, facilities have been provided for the orderly presentation and settlement of grievances.

The great majority of American workers, like the great majority of American businessmen, are law abiding. They want stable business and steady employment. To them, and to the public at large, the Government owes a duty not to permit a small minority to take the law into its hands and stop production because of local grievances that can be settled by negotiation. The solution of grievances should be undertaken by the management promptly and properly. The work should go on while grievances are being adjusted.

The proper way to settle grievances is not to suspend the authority of law by taking possession of a shop or factory. That is not collective bargaining. The proper way and the American way is the way of friendly conference and negotiation in a spirit of reason and good faith. The other way leads to anarchy, and eventually to arbitrary and despotic rule.

DEMANDS ORDER BE PRESERVED

While the State government stands ready to help both sides in settling disputes, it is prepared to do whatever it finds necessary to preserve order, protect legal rights, and restrain unlawful acts on either side. The local governments should stand ready to do the same.

It is expected that both employers and workers will keep agreements entered into by their authorized representatives, and have recourse to the public authority for necessary protection and assistance, instead of employing arbitrary or violent measures.

It is noted with satisfaction that the men in the Fisher Body plant at Pontiac have decided to resume work while their grievances are being considered in conference between representatives of the union and the management. Their decision is commended.

The Government has shown every consideration for the rights and interests of workers, and this Government will continue to do so. But it also has a duty to see that the laws of the land are observed and governmental authority is maintained. Otherwise democratic rule will not endure, and individual liberty will perish in the land of its birth.

The foregoing statement, while it does not, in terms, condemn the sit-down strike as illegal, such is a fair inference, for the Governor said—let me repeat—

The proper way to settle grievances is not to suspend the authority of law by taking possession of a factory.

It is regrettable that the Governor was not of that opinion at the time he permitted armed men from other States to take possession of the factories of General Motors at Flint and to hold that possession in defiance of the orders of the court for 44 days.

It is regrettable that, when Judge Gadola made a court order, under which the sheriff of Genesee County might, and probably would, have caused those factories to be vacated, the Governor, instead of declaring that the law must be obeyed, that it was not proper to take "possession of a shop or factory," threw his influence on the side of the law violators.

A firm statement made at that time that the law would be enforced, the calling upon the National Guard to uphold the law of the land, would have caused the evacuation of those factories without the shedding of a drop of blood, for that has been the result elsewhere.

Witness what followed Governor Davey's action when C. I. O. threatened to take possession of factories in that State and Governor Davey called upon the National Guard to stand by. The proposed unlawful seizure of the Ohio plants was indefinitely postponed.

Governor Murphy's words are fair upon their face and for them he is entitled to the thanks of every law-respecting citizen of Michigan and we should, assuming that he means to follow his words, if necessary, by action, express our approval.

We cannot overlook the fact, however, that, while those strikes were on in the city of Detroit, the Governor, while declaring in favor of the enforcement of the law, took no steps to make that declaration effective, but permitted strikers to seize factories and business places.

It is extremely unfortunate that the Governor's declaration in favor of the enforcement of the law, his condemnation of the sit-down strike, did not come prior to the recent sit-down strike staged by the workers of Pontiac contrary to the orders of Homer Martin of the U. A. W. A.

Coming subsequent to that event, some will see in the declaration a desire to aid Martin, head of a C. I. O. affiliate, while the same aid was withheld from employers earlier in the year.

Be the purpose what it may, let us, for the present, assume the Governor to be sincere in his statement that he intends hereafter to protect the man who wants to work, whether or not that man has signed on the dotted line for Homer Martin and John L. Lewis.

Let us congratulate the Governor for his stand in favor of law and order, even though he arrives at that position somewhat belatedly and only after the prestige, power, and influence of Homer Martin and C. I. O. have been threatened by a sit-down strike.

That the Governor's course is meeting with the approval of citizens generally throughout Michigan is quite evident, and Editor Banyon, in the News-Palladium of Benton Harbor, Mich., so well gives the opinion of the average Michigan citizen, that I quote:

MURPHY'S RIGHT-ABOUT

Gov. Frank Murphy is beginning to talk a bit differently about sit-down strikes. The useless and senseless and unauthorized sit-down in Pontiac, wherein a few threw thousands out of employment, appears to have annoyed the Governor. He's even gotten around to the point where a sit-down isn't collective bargaining.

"What we need right now," says the Governor, "is stability in employment and business. The worker needs this as much as the employer does."

The Governor speaks wisely and well these days, as business runs downhill instead of up and a recession, if perhaps only temporary, widens and deepens to national proportions.

The tragic phase of the Governor's apparently new attitude on labor relations is that he wasn't thinking these thoughts last winter and spring, when the first sit-downs spawned in Flint and Detroit and eventually led on to a period of almost open anarchy. Then the Governor was playing a free-and-loose hand with the C. I. O. boys. He let them hold the automobile plants against even court orders and called out the State troops to see to it that nobody molested the trespassers.

Before this disgraceful chapter in Michigan's industrial history finally ended, the sit-down nuisance had spread across the country. It finally washed up on the rocks of inflamed public opinion, with Congress condemning this means of industrial warfare and even President Roosevelt finally in a gesture of disgust voicing "a plague on both your houses."

The sit-downs cost workers millions of dollars in wages; industrial and other managements lost heavily from interrupted business and actual damage to plants and goods; the taxpayers were out a pretty sum, what with standing the bill for troops and other law-enforcement activities; and business recovery generally was substantially hurt, what with all the accumulated losses and, even more important, the feeling of dismay and discouragement that prevailed among law-abiding people of all ranks when they saw law and order defied, private property seized and held, and the courts ignored.

Perhaps we should be thankful that Governor Murphy is seeing the sit-down and its misshapen fruits in a new light. But what a tragedy it is that his conversion, if it is a conversion, comes so late. And what a name the Governor could have made for himself, with all of Michigan and all of the country, if last winter, when the first Flint plant was seized, he had announced that in Michigan, at least, private property was going to be secure, that men who wanted to work could work, and that while labor's rights in any industrial dispute would be scrupulously protected, the same protection and the same privilege would be accorded to the employing managements. That's the American way of fair play and the American system of democratic government.

Many Businesses and Thousands of Jobs Can Be Saved

EXTENSION OF REMARKS

OF

HON. BRUCE BARTON

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Monday, November 29 (legislative day of Thursday, November 25), 1937

Mr. BARTON. Mr. Speaker, here are brief extracts from the letters of small-business men whose businesses are being murdered. I have a basketful of such letters and more arrive by every mail. Why is not it possible for us to repeal the undistributed-profits tax at once—today? The repeal will not affect some of these little employers directly but the psychological value will be tremendous. As a signal to the Nation that Congress is legislating again to help instead of hinder industry, it will banish fear and inspire fresh courage. I read in the newspapers that this law will be taken off the books next session, but that there is not time to act this session. Why? The Congress has shown in the past that it can do unwise things quickly; why cannot it do a wise thing quickly? Every day of postponement means that more little businesses fold up and more men are out of work. Why cannot we put aside every partisan consideration and act unanimously, and at once? We can save thousands of little businesses and tens of thousands of jobs.

First. From a small manufacturer:

As a constituent of yours, may I take a few moments of your time to lay before you the business difficulties that beset me? I employ 10 people earning from $20 to $70 weekly, one-half unionized. The recent slump in business is costing me about $100 a day, and unless a pick-up is experienced soon, it will mean the closing up of this business, with the result that these people will lose their jobs.

Second. From a builder:

Ours is the oldest building construction firm in New York City, but due to high prices, the unwarranted demands of labor, and lack of demand for additional space, we have not done any building in 7 years. I have devoted my entire time to the management

of our properties, which have been in my family for 50 years; now, due to the "crackpot" schemes and ideas and schemes put forth in Washington, it looks very much as if we might lose our life savings.

Third. From a very small specialty manufacturer:

Since moving here last June I haven't been able to pay 1 month's rent out of my business. It is unbelievable that there is absolutely no season. I have been in business 6 years, and this is the only time there's no season.

Fourth. From a manufacturer of lace:

Since the United States signed the reciprocity agreement with France, our industry has been sick. The duty on laces was reduced from 60 percent to 90 percent, and at the time the agreement was signed the franc was about 6½ cents, and now the franc is 3⅜ cents.

A clause in the agreement provided that if the exchange is reduced or if it falls, each country has the right to advance the tariff to conform to the reduction of the exchange, or give 30 days' notice to discontinue the agreement. Nothing was done by the administration at all.

Merchandise is coming over in large quantities to such an extent that we are forced to close down some of the mills, and some are working part time. The people that were employed are out of work eating up what little resources they had to fall back on.

Fifth. From a distributor of sewing machines:

There are in New York City alone over 400 sewing-machine dealers with a total invested capital of possibly $10,000,000. The almost complete stoppage of manufacture in all industries using sewing machines (such as manufacture of dresses, shirts, work garments, shoes, men's clothing, corsets, underwear, etc.) has not only made it virtually impossible for sewing-machine dealers to secure new business, but has put them in a precarious financial condition, because they have not been able to collect outstanding moneys due them on business they have done in the past. Our entire industry, employing in the neighborhood of 4,000 people, is on the verge of a complete collapse.

Sixth. From a manufacturer of paper boxes:

During the 3 years ending this December 31 our company will have spent in new additions to our plant, including machinery, over $150,000. Most of this amount was spent within the past 15 months. We have also placed an additional $30,000 for spring 1938 delivery, covering additional machinery, in spite of the undistributed-profits tax which we knew would present us with a serious financial problem.

In order to house this new machine we have to erect an additional building but we find now that no matter how attractive our improvements may seem we are absolutely stopped from erecting this additional building because of the destructive force of this tax.

Seventh. From the owner of a chain of stores selling low-priced clothing:

Recently our organization leased and improved a store which was to open October 16. After the alterations were completed, and prior to the opening of the store, we were forced to negotiate with a window trimmers' union (a mushroom union just sprung up recently).

They forced us to sign under threats that unless we signed at once the demands tomorrow would be $10 more for each man. They were ready to picket the stores at a moment's notice. While their agent was talking to us the pickets were waiting at our various stores ready to start parading.

We have learned since that several of our competitors signed contracts with the same union, giving their men $35 for a presser, $40 for an assistant, and $55 for a window trimmer, on a 45-hour week. Then other competitors settled for the same jobs at $40, $45, and $60 for a 40-hour week. We were made to pay for the same jobs $42, $45, and $75 a week for a 35-hour week and 5 days only. We also had to take three men for this job whereas previously we had only one with a part-time assistant. How can we now employ three men?

They demanded that we hire another man at $65 per week for the store, even though we did not have work for him. The average cost for trimming a store window of this size is about $200 per year. Still they wanted to force upon us an annual expense of $4,480, although we cannot possibly keep the other three men busy for 35 hours per week.

Finally we were forced to drop our investment, and the store was not opened. This "closing before the opening" has kept several men out of prospective jobs. This also has forced us to cancel our order for merchandise and our entire advertising program, ultimately causing a loss to everybody who would profit from the opening of this store.

We originally operated 15 stores, but recently closed 4 due to the fact that unions boosted our overhead to such an unreasonable extent that we could not stand it, and it still continues to rise in spite of the fact that at this time the salaries of our people in most cases are more than doubled and hours reduced 33 percent.

We can quote a countless number of firms that were forced to curtail their business for the same or similar reasons; some who have been forced out of business and many more who will definitely be forced out of business unless there will be some encouragement in sight for immediate relief.

It is urgent that immediate action be taken to save millions of merchants and their employees from starvation, particularly retailers who are in a tough spot right now and cannot wait. Otherwise we, as well as thousands of retailers, will be forced out of business, and the merchants, together with their employees, will be added to the relief rolls.

Mr. Speaker, on Monday morning, November 15, the President of the United States sent us this comforting message:

The present decline [in business] has not yet reached serious proportions.

Mr. Speaker, these small-business men would agree with the President that the present situation is not "serious." They would say that "serious" is far too mild a word. To them the present crisis means the loss of their life savings, the discharge of their employees, and the destruction of their hopes. They are fighting for their lives. We ought to help them now before it is too late.

Stop Helping Japan

EXTENSION OF REMARKS

OF

HON. DAVID J. LEWIS

OF MARYLAND

IN THE HOUSE OF REPRESENTATIVES

Monday, November 29 (legislative day of Thursday, November 25), 1937

LETTER WRITTEN TO THE WASHINGTON POST BY HON. HENRY L. STIMSON, FORMER SECRETARY OF STATE

Mr. LEWIS of Maryland. Mr. Speaker, under the leave to extend my remarks in the RECORD, I include the following letter written to the Washington Post by Hon. Henry L. Stimson, former Secretary of State:

STOP HELPING JAPAN—STIMSON

(By Henry L. Stimson, former Secretary of State)

(A letter to the Washington Post)

Americans are shocked and outraged at what is taking place in the Far East. But to many of them it presents merely a confused picture of distant horrors with which they think we have no necessary connection and to which they can close their eyes and turn their backs in the belief that we owe no duty to the situation except to keep out of it and forget it. It may be useful under such circumstances to try to recall briefly certain broad features inherent in this situation which relate to us and our ultimate future.

In the first place, many of us do not adequately appraise the size and character of the Chinese Nation; the influence of its civilization on Asia in the past and, what far more important, the influence for good or evil which it may have on the rest of the entire world, including ourselves, in the years and centuries to come. For 4,000 years China has maintained what is far and away the most persistent cultural solidarity which has existed in the world. In all those centuries no foreign conquest and no passage of time has been able permanently to materially change or deflect her development.

In the next place, the dominant characteristic of this culture of these four hundred fifty millions of people, devoted mainly to agriculture, has been for centuries inherently peaceful. As one evidence of this, their culture has produced for themselves a status where the individual Chinese has required less government than the individuals of any other nation. Although covering an immense territory with enormous numbers, their personal relationships have remained virtually upon a family or patriarchal basis as distinguished from the various forms of community and national government existing elsewhere. Recent Chinese wars have been purely defensive and internal. No outside nation has any reason to fear any armed attack from China provided China continues her own peculiar methods of development and organization. On the contrary, all such nations could look forward to profitable commercial intercourse with the millions of Chinese who are as keen, capable, and honest in business as they are peaceful as neighbors.

HISTORY OF "OPEN DOOR" POLICY IS RECALLED

During the past century when the age of steam and electricity brought the modern western world into close contact with the Far East, China was at first regarded as an easy prey for the imperialistic ambitions of the more warlike nations. During the close of the nineteenth century a scramble commenced among such

nations to seize and divide up her territory. The effort produced a great rebellion in China known as the Boxer Rebellion. At this juncture our own Nation, the United States, successfully put forward a policy designed to arrest this scramble and its disastrous consequences. John Hay, as our Secretary of State, succeeded, with the warm concurrence of Great Britain, in pledging the other nations to an "open door" policy toward China. This policy was based upon two principles: (1) Equality of commercial opportunity among all nations dealing with China, and (2) as necessary to that equality, the preservation of China's territorial and administrative integrity.

Twenty years later, after the downfall of the imperial government of China and the effort of the Chinese to set up a republican form of government were again producing civil war and chaotic conditions in China, our government again stepped forward at the Washington conference in 1921 and succeeded in having the principles of the open-door policy of Mr. Hay embodied in a formal treaty to all of the nations having possessions in the Far East, including Japan. This became known as the Nine Power Treaty. All of its signatories agreed:

"1. To respect the sovereignty, the independence, and the territorial and administrative integrity of China.

"2. To provide the fullest and most unembarrassed opportunity to China to develop and maintain for herself an effective and stable government.

"3. To use their influence for the purpose of effectually establishing and maintaining the principle of equal opportunity for the commerce and industry of all nations throughout the territory of China.

"4. To refrain from taking advantage of conditions in China in order to seek special rights or privileges which would abridge the rights of subjects or citizens of friendly states and form countenancing action inimical to the security of such states."

FIFTEEN NATIONS HAVE AGREED TO UPHOLD TREATY

This was one of the most admirable and far-sighted treaties in the history of modern civilization. It has been joined in not only by ourselves, the British Empire, China, and Japan, but also by France, Italy, Belgium, the Netherlands, Portugal, Norway, Sweden, Denmark, Mexico, and Bolivia. Germany also signed it, though her Parliament has not yet ratified it. It at once stabilized the post-war jealousies and fluctuations in that part of the world.

The United States and Great Britain agreed to limit the size of their fleets and to refrain from further fortifications in the Far East in reliance upon the Japanese agreement to leave China alone and thus to preserve the opportunities of other nations for peaceful commerce with China.

The treaty was based upon a recognition of the importance of giving China a free hand in her gigantic task of economic and political reorganization and constituted a deliberate policy of renunciation of the aggression against her during that process. It represented a common faith that only by such a process under the protection of such an agreement could the fullest interest not only of China but of all nations who had intercourse with her best be served.

Furthermore, this treaty correctly represented the personal attitude of the American people themselves toward China and our sympathy with and interest in her growth and future. For many years our people have been conducting in China the greatest humanitarian and educational effort which has ever been unofficially conducted by the people of one great nation toward another.

AMERICAN ASSISTANCE TO CHURCHES, SCHOOLS CITED

From hundreds of American towns and cities thousands of Christian missionaries and American educators and scientists have gone to devote their lives to the assistance of China and the Chinese people on their new entry into the modern world. By American sacrifice and American money colleges, schools, hospitals, and churches have been built throughout Chinese territory in its most remote and inaccessible portions.

Simultaneously in scores of our own schools and colleges for over half a century we have been receiving thousands of eager Chinese students and educating them according to American social and political principles. The personnel of the Nationalist Government of China today shows marked results of these American efforts. Many of her leading statesmen, directly or indirectly, have been influenced by our work and principles.

For 10 years China remained in lawful and recognized occupation of her territory. During that time Japan, being then herself under the government and leadership of statesmen of liberal and responsible views, was faithful to her treaty obligations and maintained toward China a policy of moderation and international good citizenship. Unfortunately the historical background of Japan was entirely different from that of China. Ninety years ago Japan was a purely military autocracy organized upon feudal lines of the medieval ages. And although during the past century she has made marvelous and gigantic strides in the technical arts, in commerce, and industrialization; although she adopted a constitution with parliamentary features and has been extending suffrage among her people, she was far from having reached the stage of liberal democracy. For 7 centuries prior to 1850 her privileged class had been that of the soldier, and underneath the veneer of her modern parliamentarianism could be found military leaders, cherishing grandiose ambitions for military conquests as well as a general population which was very sensitive to the appeal of military fanaticism.

DEPRESSION BROUGHT IMPERIAL OPPORTUNITY

To such imperialist leaders in Japan the depression of 1930 brought their opportunity. They had long cherished plans for a military exploitation of China and on September 18, 1931, defying the civil leaders of their own Government, the Japanese Army seized Manchuria. Within 3 months they had torn away from China provinces having an aggregate territory as large as Germany and France combined and which were occupied by a population of 30,000,000 of Chinese. A few weeks later, in January 1932, a Japanese expeditionary force attacked Shanghai, aiming a blow at the very center of China's territory and commerce. But meeting an entirely unexpected, courageous, and stubborn resistance by the Chinese Nineteenth Route Army, as well as with vigorous protests from the American Government and the League of Nations, and possibly because the total American fleet was held united at Hawaii on the flank of the Japanese aggression, Japan in a few months withdrew her forces from Shanghai with her objective unattained.

Since then there has ensued a 4-year interval during which significant changes have occurred. In Japan militarism has consolidated its hold upon the Government partly by a campaign of terrorism, which involved the assassination of the moderate Japanese statesmen, and partly by the appeal which the successful military conquest in Manchuria has made to such an emotional population as the Japanese.

With militarism thus fortified at home, Japan has boldly claimed an economic and political hegemony over China, which is in complete disregard of her former promises in the Nine Power Treaty. Simultaneously she has been pushing forward partly disguised military and political steps to effectuate it. She has instigated attempts to break away some of the northern Provinces of China proper and to form in them separate autonomous governments. She has engineered invasions by Manchukuoan troops into inner Mongolia.

CHINESE RESISTANCE STEADILY STIFFENED

In these steps she has not been very successful and has found the Chinese resistance to her aggression steadily stiffened. Under the cautious but skillful leadership of Chiang Kai-Shek and inspired by the dangers which now so clearly confront them, the people of China have been making unprecedented progress toward the achievement of national unity and administrative cooperation, and this fact has not escaped the notice of Japan.

Simultaneously events have been occurring in the outside world which might well make Japan think her opportunity had arrived for a new attack on China. The Fascist dictators of Italy and Germany have boldly and successfully carried through coups involving in Ethiopia, the Rhineland, and Spain acts of treaty violation and indefensible aggression. On the other hand, the peaceful democracies of the world, being absorbed with the work of recuperation from the depression and other consequences of the great war, have yielded to these lawless acts of the dictators with a lack of their customary spirit.

In Britain and America, usually in the van of matters of international morality, the people have seemingly been smitten by a temporary seizure of nervous "jitters." This has been excusable in Britain, faced as she has been, and is now, with an extremely perilous European condition within range of her home cities. But in America, occupying the most safe and defensible position in the world, there has been no excuse except faulty reasoning for the wave of ostrich-like isolationism which has swept over us and for the erroneous form of neutrality legislation which has threatened to bring upon us in the future the very dangers of war which we now are seeking to avoid.

INTERNAL DISORDERS HAMPERING RUSSIA

Finally last winter in Russia, the one nation whose great and growing power lies within reach of North China, and which is feared by Japan, there occurred domestic incidents which were widely interpreted in the outside world as evidencing grave internal disorders.

Evidently taking advantage of these conditions, Japan has struck again, aiming both at North China as far as the Yellow River, and also at the center of China at Shanghai. No excuse worthy of a moment's consideration has been given for the attack. On the contrary, the statements emanating from Tokyo make abundantly clear that there is no such excuse. The Chinese Government is denounced as infamous for not yielding to Japan's wishes in North China, and the announcement is made in the press that the attack will continue until the government at Nanking is destroyed.

The methods of the attack also indicate that this is the objective. China's coasts are blocked and her shipping seized and a widespread campaign of bombarding the civilian Chinese population, huddled into great defenseless cities and remote from any military movement or objective, is put into effect. These steps make clear a deliberate and systematic attempt by Japan by a general campaign of terrorism practiced upon the civilian population to force the Chinese Government to yield.

Making all allowances for imperfect information, the general scope of what Japan is attempting is abundantly clear. We can also forecast some of the effects which her attempt may have upon the outside world, including ourselves.

In general Japan is trying to take control of the development of modern China and to twist its form and nature to suit her own aims, both political and economic. She is trying to develop China in a way which is the exact opposite of the purpose and policy of the "open door" and the Nine Power Treaty. Japan makes no secret of this. We do not have to guess. We have a perfectly

frank exposition of her plan in what she has already done in Manchukuo and North China.

COMMERCIAL MONOPOLY HELD CHIEF AIM

She does not contemplate "the preservation of China's territorial and administrative integrity." She is actually engaged in carving up China's territory and herself taking over China's administration. She does not propose equality of commercial opportunity among all nations dealing with China. She is seeking to monopolize that opportunity and has already taken effective steps to do so in Manchukuo.

She is thus trying completely to transform China's own business methods and character and culture and to dominate them to her own national ends. Furthermore, she is not seeking to do this by persuasion or education or other peaceful means but by force and terrorism of the most brutal and barbarous kind.

Japan is not a good colonizer even of backward races. Her colonizing methods have been recently described by an able student of the Far East.

"What capacity she possesses for construction is counterbalanced by a lack in the intangibles of ruling. Her notorious psychological deficiencies have never been more conspicuous. * * * Not only are the inhabitants of Manchukuo unreconstructedly hostile, * * * Japan has not the capacity to win loyalty by sharing benefits and rewards. * * * Japanese can command but they cannot cooperate." These words were from The Price of Japanese Imperialism, by Nathaniel Pfeffer, in Foreign Affairs, October 1937.

FINANCIAL RESOURCES LACKING FOR COLONIES

Japan has not even the financial resources which are notoriously necessary for colonial exploitation. Her efforts in Manchukuo have already strained her own national resources to the uttermost. Before she made the present attack her unstable economic condition was known to all students. Her credit was impaired, her currency in jeopardy, and her foreign trade, upon which she was dependent for the necessary exchange to carry on her imports, had been curtailed by drastic restrictions. The conditions of her industrial workers have been becoming progressively more difficult. Real wages in Japan are nearly 20 percent below 1931, while the cost of living has risen by 25 percent.

In short, this headstrong little nation, herself on the verge of bankruptcy from the efforts of her previous adventure in Manchukuo, is seeking to recoup herself by a brutal attempt to conquer and exploit a population over four times her size and composed of men who are individually as brave and tenacious as her own people, and who are at least their equal in mentality and civilization.

In such a situation, what is the forecast for us and the rest of the world? Japan probably cannot succeed in permanently dominating the whole or even a major portion of China. But she may temporarily force into her armies large masses of the good fighting power of the Chinese to use in making trouble elsewhere in the world. And certainly she can disastrously embarrass and retard the efforts which China has been making for development in her own peaceful commercial way.

Japan thus can cause immense loss to all nations commercially interested in China and for a time she may make herself a stronger military power than she is at present, with the result of causing great apprehension and danger in the area of the North Pacific. For a considerable time, if Japan is able to proceed in her own way, there will be a great storm center in Northeastern Asia, with grave possible threats and disturbances to us and our interests. For our Pacific States already occupy ringside seats at this battle.

Such, in brief, is the situation across the Pacific which confronts our Nation. It is one of those acute international crises which force the people of this Nation to think hard and clearly on subjects which they are not accustomed to deal with in normal times. Our Amerian people are aroused and angry at the callous brutality of the Japanese. There is apparently no difference of opinion in their minds as to the merits of the controversy. Their abhorrence of injustice and oppression causes them immediately and universally to sympathize with China, but they do not see how anything can be done about it. They seem to be getting steadily more angry without knowing whether there is any proper outlet for their indignation.

No one knows better than I the difficulties which confront our Government in such a situation. No one has a keener desire than I to avoid making more difficult the position of my successor in the State Department, for whom I have the greatest respect. But in every democratic nation the task of those entrusted with guiding its course in such a crisis would be made easier or harder accordingly as the attitude of the public is intelligent and farsighted or the reverse. I therefore conceive it to be a time when every effort should be made by citizens to contribute to the general discussion which is taking place in such a way as to help the understanding of his fellows to the end that it may be intelligent and farsighted. It is with this object that I venture these reflections upon the subject. In them I shall continue to remain as far away as possible in the realm of generalities. It is usually best for the Government itself to propose specific measures without being hampered by specific proposals from the public.

In the first place, let me make it perfectly clear that, in my opinion, this is not a case where there should be any thought of America sending armies to participate in a strife that is going on in Asia. Not only is such a course probably militarily impossible; not only would be abhorrent to our people, but to attempt it would do much more harm than good.

The future character of the civilization of Asia must be determined, whether peacefully or by war, by the men of Asia themselves. If China is to be saved from domination by force, it must be saved by the courage and sacrifice of armed Chinese men. The problem of the preservation of China's peaceful civilization cannot be solved by the armed intervention of the Occident.

DEMOCRACIES LENDING INVALUABLE ASSISTANCE

But that is very far from saying that the only alternative is inaction or a passive and shameful acquiescence in the wrong that is now being done. The lamentable fact is that today the aggression of Japan is being actively assisted by the efforts of men of our own Nation and men of the other great democracy in the world—the British Commonwealth of Nations. It is not only being actively assisted but our assistance is so effective and predominant that, without it, even today the aggression would, in all probability, be promptly checked and cease.

Let me explain this and make it absolutely clear. Japan's position as a war-making nation is far from being self-contained. She is peculiarly dependent upon the outside world for her ability to attack China. While she has ample facilities for manufacturing weapons of all kinds, she is extraordinarily lacking in the raw materials with which to carry on such manufactures. In that respect she is extremely vulnerable. She has no supplies of oil worthy of the name. She has no supplies of rubber whatever. She has very little iron ore—about one-seventh of what she uses even in peacetimes, and she has almost no cotton.

A further peculiarity of Japan's economic condition is that she purchases her supplies of these vitally essential commodities from a very few nations and by far the principal sellers are Great Britain and ourselves. During the 18 months prior to June 1936 she purchased 75 percent of her oil from us and one-half of her importations of iron ore and scrap iron also came from us. During the same period over 80 percent of her imports of raw cotton came from the United States and British India and the principal supplies of her rubber came from the British Straits Settlements.

Again, in Japan's present tottering financial condition she is able to make these purchases of raw material for her guns and ammunition only by selling enough of her own products to obtain the requisite foreign exchange to pay for her purchases.

UNITED STATES BUYS 85 PERCENT OF JAPAN'S RAW SILK

One of these principal Japanese exports is raw silk. This is one of the most generally distributed crops of the Japanese Empire, the production of raw silk taking place in virtually every peasant home and farm. Of that crop the United States in 1935 purchased 85 percent and in the first 6 months of 1936, 81 percent; with Great Britain taking nearly all the rest. With the foreign exchange thus obtained Japan is purchasing from us, as I have said above, the raw materials for her guns.

It is not necessary to go further into the picture. Today hundreds of thousands of brave Chinese are fighting a desperate and hopeless battle. The press reports teem with evidences of their desperate valor and heroic self-sacrifice. But modern war is a matter of machinery and munitions. These brave men are virtually armed only with the rifles and machine guns which they carry. Even their supply of cartridges for these weapons is pitifully inadequate. Their artillery is woefully insufficient, their planes merely a fraction in number of the planes of their opponents, and they have no tanks.

Day after day there are being rained upon them bombs from an unobstructed hostile air force and shells from an overwhelming mass of artillery, while their lines are being pierced at intervals by tanks which they have no means of stopping. Yet they have made a resistance so far which has won the admiration of the world. The odds against which they are fighting are being made possible by us.

So I say that the first glaring fact which stares us in the face in our analysis of the situation is that China's principal need is not that something should be done by outside nations to help her, but that outside nations should cease helping her enemy. Given a situation in which the supply of munitions was only somewhat less unequal, China's bravery has already shown that Japan's task would be hopeless.

In the light of these facts, the first question that I should ask of the American and British people is: Does the safety of the American Nation and the safety of the British require that we go on helping Japan to exterminate, by the methods she is daily employing, the gallant Chinese soldiers with whom she is confronted—not to speak of the civilian Chinese population that she is engaged in terrorizing? Is the condition of our statesmanship so pitifully inadequate that we cannot devise the simple means of international cooperation which would stop our participation in this slaughter? I for one do not think so. I believe it can be done, and done effectively, without serious danger to us.

PEACE HAS BEEN PUT ABOVE RIGHTEOUSNESS

The second great fact which the present situation brings out is the deep-seated error which has pervaded recent American thinking on international matters. I have heard Theodore Roosevelt say that he put peace above everything except righteousness.

Where the two came into conflict he supported righteousness. In our recent efforts to avoid war we have reversed this principle and are trying to put peace above righteousness. We have thereby gone far toward killing the influence of our country in the progress of the world. At the same time, instead of protecting we have endangered our own peace.

Our recent neutrality legislation attempts to impose a dead level of neutral conduct on the part of our Government between right and wrong, between an aggressor and its victim, between a breaker of the law of nations and the nations who are endeavoring to uphold the law. It won't work. Such a policy of a moral drift of such a safe and powerful nation as our own will only set back the hands of progress. It will not save us from entanglement. It will even make entanglement more certain. History has already amply shown this last fact.

As if to teach us the folly of our ways, since this legislation was adopted, fate has paraded before our shocked consciousness two instances of glaring aggression in Ethiopia and the Far East. Progress is not made in the world by attempting to exclude a consideration of the difference between right and wrong, nor is it wise legislation to attempt to impose upon the President, to whom the Constitution gives the duty of the conduct of our international affairs, shackles of restraint to hold him helpless in all future conditions, no matter how complex or unanticipated.

Finally, in this grave crisis in the Far East we not only must not fear to face issues of right and wrong, but we must not fear to cooperate with other nations who are similarly attempting to face those issues. The League of Nations was founded upon a covenant which almost for the first time in human history attempted to base our international civilization upon a reign of law and to make a distinction between a lawbreaker and its victim. Five years ago, on Japan's first aggression into Manchuria, the League, while failing to stop the aggression, did not hesitate to pass judgment upon it in unmistakable language after a full investigation of its facts.

UNITED STATES GAVE SUPPORT TO LEAGUE IN 1933

The League did not fail to distinguish between right and wrong in the Far East then, and the American Government, on February 25, 1933, did not hesitate to range itself alongside of the League in that judgment and to declare that its understanding of the facts was in accord with the findings of fact arrived at by the League and that its conclusions were in accord with the conclusions of the League.

Today on China's appeal the League is again engaged in an examination of the present crisis and the formulation of its judgment thereon. Our Government should not hesitate, if the facts are as we believe them, to support the League again by a statement of its concurrence. Such a judgment is not futile. In the process of time law is built up both within and without national boundaries by such decisions and such precedents. Japan is far more friendless today before the tribunal of world opinion than she would have been except for the investigation and judgment which was rendered against her 5 years ago. We should not fail to take our part in laying such foundations of the structure of international law of the future.

Since the writing of the foregoing letter has come the President's Chicago speech. I am filled with hope that this act of leadership on his part will result in a new birthday of American courage in facing and carrying through our responsibilities in this crisis.

HENRY L. STIMSON.

Theodore Augustus Walters

EXTENSION OF REMARKS

OF

HON. JAMES P. POPE

OF IDAHO

IN THE SENATE OF THE UNITED STATES

Monday, November 29 (legislative day of Tuesday, November 16), 1937

MEMORANDUM ISSUED BY THE DEPARTMENT OF THE INTERIOR ON THE DEATH OF HON. THEODORE AUGUSTUS WALTERS, FIRST ASSISTANT SECRETARY OF THE INTERIOR

Mr. POPE. Mr. President, I ask unanimous consent to have inserted in the Appendix of the RECORD a memorandum for the press issued by the Department of the Interior on November 27, 1937.

There being no objection, the memorandum was ordered to be printed in the RECORD, as follows:

Theodore Augustus Walters, First Assistant Secretary of the Interior, died this morning in Naval Hospital, Washington, D. C. Death was due to pneumonia, which developed following an operation last Wednesday.

Mr. Walters, who was 61 years of age, came to Washington from Idaho early in the Roosevelt administration to serve as First Assistant Secretary of the Interior. Only a few weeks ago he made an extended inspection tour of the grazing districts of the West, covering 9,000 miles in 31 days. Mr. Walters was familiar with the problems of the West and had been assigned by Secretary Ickes to direct grazing administration and land matters generally.

Mr. Walters was born in a two-room log house on a farm 40 miles from Dubuque, Iowa, in 1876. He received his education in the public schools and the Upper Iowa University at Fayette. He put himself through this university and through the law school of the University of Iowa by teaching.

At the age of 29 Mr. Walters abandoned teaching to enter into the practice of law at Caldwell, Idaho, where he remained until his appointment as First Assistant Secretary of the Interior in 1933.

Mr. Walters was active in Democratic politics in his State. He was elected attorney general of Idaho in 1916. He was appointed a member of the State board of education in 1914, was reappointed to the same position in 1931, and became president of the board in 1933.

Surviving Mr. Walters are his widow and two daughters, Mrs. Robert Van Uden, of Washington, D. C., and Mrs. Robert Coker, of South Carolina, and a son, John Walters, of Boise, Idaho. Mr. and Mrs. Walters made their home in Washington at the Roosevelt Hotel.

Funeral arrangements will be announced later.

Secretary Ickes, when informed of Mr. Walters' death, made the following statement:

"Theodore A. Walters was a fine public servant—devoted, sincere, and loyal to the people whom he served. As First Assistant Secretary of the Department of the Interior I had come to rely greatly upon him. He was willing to shoulder responsibility, he was a man of sound judgment, and he never complained, however great the burden that he was called upon to carry.

"As a citizen of Idaho, he was particularly interested in the development of the West, which he knew so well. One of the greatest services that he has performed has been in connection with formulating and helping to carry out the new grazing control program. Only 2 weeks ago he returned to Washington after a 9,000-mile trip through the grazing States in the interest of the conservation of the public range. On this trip he addressed many gatherings of stockmen and sheepmen. He understood their problems and they understood his language.

"The death of Mr. Walters is a personal loss to me and a serious one to the Department. All of those who have worked with him will miss him."

F. R. Carpenter, director of the Grazing Division, said:

"First Assistant Secretary Walters took a great and effective interest in the Division of Grazing, which was assigned to him for supervision.

"As the owner of several ranch properties in Idaho and as a former member of the State land board and the former attorney general of the State of Idaho, he had an exceptional fund of knowledge and background for directing the activities of the division of grazing.

"His interest in all matters extended far beyond his necessary official duties, and he went into the details of all cases and gave freely of his time and knowledge for the carrying out of this important new work.

"At the recent series of meetings in the nine Western States, his courteous and dignified manner of presiding, together with his rough and ready western way of meeting all comers on their own ground, won for him a host of friends among the stockmen of the West as well as endearing him to the members of the Division of Grazing, who were working even more closely with him."

Thanksgiving Day Sermon

EXTENSION OF REMARKS

OF

HON. SOL BLOOM

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Monday, November 29 (legislative day of Thursday, November 25), 1937

SERMON DELIVERED BY THE RIGHT REVEREND JAMES E. FREEMAN, D. D., LL. D., IN WASHINGTON CATHEDRAL AT THE NATIONAL THANKSGIVING SERVICE IN COMMEMORATION OF THE SESQUICENTENNIAL OF THE FORMATION OF THE CONSTITUTION OF THE UNITED STATES

Mr. BLOOM. Mr. Speaker, under the leave to extend my remarks in the RECORD, I include the following sermon delivered by the Right Reverend James E. Freeman, D. D., LL. D., in the Washington Cathedral at the national thanksgiving

service in commemoration of the sesquicentennial of the formation of the Constitution of the United States, sponsored by the Bishop of Washington and the dean and chapter of the Cathedral and the Grand Lodge of Free and Accepted Masons of the District of Columbia and under the auspices of the United States Constitution Sesquicentennial Commission:

St. Luke 12: 48. "Unto whomsoever much is given, of him shall be much required."

Such a statement seems obvious and axiomatic. To measure responsibility by the standard of privilege and opportunity, is on the face of it normal and consistent. Advantage of any kind, education, the acquisition of gifts and material gain, these we conceive to carry with them an obligation measured by their volume and content. It is a cardinal rule that runs the gamut of all life. A rich, highly cultivated soil must yield a bountiful crop; a pruned and carefully nurtured orchard must yield choice fruits; a youth long trained in classroom and academy must contribute his just share to the good of his fellows. This applies with like force to a favored community or a favored State. America, blessed above nations, occupies a place in the world that lays upon it heavy and ever-increasing obligations. Those of us who share its gifts and bounty are not alone recipients, we are responsible dispensers of these gifts and we dare not shirk our responsibility, else we shall prove unworthy of our place and Nation. It is this that moves us on this Thanksgiving Day not only to acknowledge the blessings that are ours, but to make searching inquiry as to the consistent discharge of our duties and obligations and to appraise them in the light of the favors and gifts we have received.

It is such a day as this that calls us away from our individual successes or failures to think in terms of our life as a people. It is a day designed to efface all distinctions and it compels us to acknowledge that we share in equal or unequal measure the blessings that have come to us from a beneficent and ever-mindful God and Father of us all. However through our selfishness and self-seeking we may have contravened the operation of His just laws, however inequitable to our vision may seem the apportionment of His gifts, it is from Him, and Him alone, that we continue to enjoy the bounty that is ours and the gifts and blessings that we commonly share. Responsive or unresponsive as we may be in our praise and gratitude, still in the reckoning of our blessings we are compelled to recognize that beyond all our cleverness and cunning resides a power that determines our strength or our weakness, our prosperity or our adversity. What our hands may fashion, our factories produce, or our inventive genius create must be reckoned apart from the favors and gifts that make life possible and its vitality and being secure.

Widespread prosperity brings its gifts and blessings to every home. Misfortune and disaster cast their dark shadows across every hearthstone. Great as is the extent of the Republic, varied as are its enterprises, there is a definite sense of corporate unity that compels us on such a day as this to think of the Nation as a whole.

The record of our advance and amazing growth and development is unparalleled in any like period in human history. Something other than the genius man, or a combination of fortuitous circumstances, has worked this modern miracle. Other nations have come to power and affluence and won their proud place in the sun, but their way has been marked by cruel aggressions and the might and power of the sword. What they coveted they ruthlessly took; their progress was the way of blood and their rule the way of tyranny. It was from such conceptions of government that our fathers revolted and rebelled and established here on this western continent a free and independent system—a system that contemplated the equality and equitable advantage of all its citizens, with liberty as its strong and compelling watchword.

For 150 years this Nation has pursued its prescribed course under the Constitution, and despite threats from without and confusions within, it has moved along its way, until it stands today incomparable among its sister nations, and the ultimate attainment of its proud destiny is yet to be revealed. The ship of state has had its days of stern trial and discipline and at times it has been halted in its progress, but again and again where crises have come, it has been directed in ways that bore evidence of divine leading, and highly ordained pilots have steered it into channels that saved it from misfortune and disaster.

As we view it today we see it, even in the face of world confusions and disorders pursuing its course, unlet and unhindered by winds that are contrary and seas that are boisterous and troubled. We are compelled to believe that its testing has lent strength to its purpose and fitted it for perils that may still lie ahead. At such a time as this and on so memorable an anniversary, we may with propriety reappraise our inheritance and with unfeigned humility discover to ourselves our weakness and our strength. To rejoice in what we have enjoyed of continuing happiness and prosperity and not to look to conditions that may prove inimical to our future growth would be to hold our trust with careless and unworthy hands. A prodigal people, indifferent to their trust or disobedient to their fundamental law, do not deserve the favor of God nor the security which their national gifts afford. We are filled with reverent awe when we survey our history and reflect upon the crises through which we have passed unscathed, guided by the hand of Him who determines the destiny of states and nations.

Must we not believe that the Constitution itself bears unmistakable evidence of His purpose and will concerning us? The story of the trials of those noble men who labored to give the new Government its guiding state paper constitutes in itself one of the most fascinating and compelling pages in the annals of human history. That they were given the prophetic vision to project themselves into the future years of the young Republic, that they wrought so wisely and well that their work has endured, gives eloquent testimony to their commanding genius.

It is interesting to observe that they were, in the main, young men, fired with the courage and imagination of youth. They seemed to envision a nation grown to great proportions peopled by diverse races, seeking its protection and its ever-expanding opportunities. It is one of the miracles of history that their planning should have been on such a scale as to accommodate itself to the swift changes of the multiplying years. We of this later generation, as we contemplate their work, are astounded and amazed as we acknowledge its comprehensiveness and adaptability. From 13 sparsely settled colonies we have grown to a mighty commonwealth of 48 sovereign and independent States. From 3,000,000 loyal adherents of a new and untried system of government, we have become a Nation whose territory reaches from ocean to ocean, with a vast population of 130,000,000. Within our confines we have the children of every race and tongue, drawn as by some magnetic influence from the peoples of the Old World. Slow as the processes of assimilation have been, and foreign as yet to our ways as are those who have sought our shores, still we demonstrate to the world about us a unity in diversity that makes of the Republic a major power in the sisterhood of nations.

Measured by what we represent of genius, resources, and capacities, we stand at the forefront of the world's greatest states. We have at times lacked restraint in appraising our possessions, we have been arrogant and boastful in proclaiming our wealth and our power; these are but the symptoms of a youthful and overzealous people. A kindly judgment may overlook the indiscretions of youth. These latter years have put upon us new tests and compelled us to study afresh our systems and our habits as a people. In the light of the swift and tragic changes that have come to the nations overseas, and in the face of a conspiracy of forces that would seek to divert us from our chosen course, we have to think deeply and soberly about the consistencies and inconsistencies that characterize our life.

It has been made clearly evident to us that the rapidity of our growth and the expansion of our industries have outdistanced our capacity to deal fairly and equitably with the problems they have created or to remedy the evils which inevitably accompany abnormal growth and development. Where one evil practice has been scotched and extirpated new and manifold evils appear. Where we have cultivated rugged individualism and stressed its gifts of initiative, we have failed signally to meet the large corporate problems that follow the concentration of population in great cities. This may have been the normal experience of a nation that rapidly changed from rural to urban conditions. Once we were tillers of the soil and the products of our fields constituted our chief wealth. Today we are the builders and operators of vast and complex mechanisms and men, and women, too, have become but cogs in our industrial workroom.

Surely the changes have been kaleidoscopic and they have created new problems that demand the best we have of genius and statesmanship. Our basic principles do not change; their application to meet new needs calls for the wisest and most consistent judgment we have to give. We are not reactionary when we turn to our avowed and cherished ideals and give them place in our life; we are guilty of an inconsistent conservatism when we fail to recognize that "new occasions teach new duties." The fact that new and untried experiments are in process in other lands must not affect us in our determined course. America stands as a tested experiment in government, and its ways and practices are not the ways of Europe and Asia. This we need to affirm with deepened conviction today. We predicate our system upon principles that are unique to a people whose avowed purpose is the fullest and most equitable distribution of the blessings and gifts of life.

If in other places and in other lands a new freedom is being sought by methods that are strange to our accepted view and practice, we bid them Godspeed, but we ask that we be freed from their devices and unembarrassed by their persistent propaganda. We lay no claim to impeccability, we have our faults and our weaknesses, and we frankly acknowledge them, but we will pursue our way, unlet and unhindered by forces that are alien and that lie outside our borders. That we are jealous of our traditions and our ways does not preclude our hearty and generous praise of nations, whose habits and practices are foreign to our fixed ideals. We may admire even if we do not emulate their virtues. This needs to be our practice, and more so today than at any period of our history. We have to reckon, and reckon vigorously and persistently, with elements within our confines that readily accept the blessings which this land affords, but would entangle us in systems and policies that can have no consistent place in our corporate life. Our threatening danger is not from an excess of pride in what we have of tradition and system; it resides in our supineness in courageously maintaining the system we have. We make no fetish of our fundamental law

nor do we refrain from amending its provisions as occasion demands. To make it more just and equitable, this we have done and shall continue to do, but only as our own people registers its mind and its will.

Behind the Constitution and behind our democratic institutions resides a clearly defined, clearly professed religious faith, and a body of ideals that had its genesis on these shores. They were not ideals imported from some ancient or modern state; they were peculiar to the conditions that were faced by the fathers of the Republic. That reliance upon God was conspicuous in their deliberations, that they were deeply conscious of fundamental moral values is clearly evident in their work. They had drunk deeply at the spring of truth and it was their solemn conviction that the truth, and the truth alone, could make men free. It was something other than a finely conceived scaffolding which they built, perfect as that scaffolding might be; they knew as men have rarely known that the cohesive element in a structure that was to endure, was the moral and spiritual character of the people for whom the fabric was created. Washington affirmed this when he declared that the sure props of stable government are morality and religion. When we have been true to this ideal we have prospered; when we have been recreant to it we have tragically and swiftly declined.

These more recent years have given startling evidence of this. This country of ours is as rich in its resources as it has ever been. It has an industrious and loyal people ready to serve it in every emergency. It is quite self-sufficient within itself to guarantee to every citizen a subsistence ample and adequate to every need. Its broad acres yield harvests to meet the demands of every household. Its manpower is adequate to run its mills and factories and to give it protection from every foe. Yet in spite of this it has been caused to reel and stagger under a combination of circumstances that have impaired its confidence and paralyzed its initiative. Even while we meet on this Thanksgiving Day there are hungry men, women, and children in a land of plenty, and countless toilers who are denied the just rewards of their own labors. No Aladdin's lamp can supply this deficiency. Systems of unearned doles or gratuities cannot assuage the pain of poverty or ease the burdens which long continued idleness imposes. Our cities outvie and outshine the cities of the ancient world, and Babylon in all its splendor could not compare with a metropolitan center of this western world. In all our reckoning and in all our advances, something, and that basic, has been lacking in our philosophy. Much we have received; of us much shall be required.

We are builders of a state that must endure; the stones we quarry and the cement we use must be of such tested quality and worth that the fabric we erect shall withstand the shocks and strains of recurring crises. Have we the stamina and the moral fiber to equip ourselves against the storms and misfortunes that must surely come? Are we raising up in this land of ours a generation of men and women who are to be the conservers and preservers of the precepts, principles, and ideals that fortify and insure the state against disaster? Yes, are we of the present generation so strong in our pursuit of moral and spiritual ideals that we cannot be moved by the glamor and charm of our growing material wealth and possessions?

These are not idle speculations; they cut deeply into the things we love and cherish most. If on a critical occasion a great leader of the Republic declared that this Nation could not endure half slave and half free, we of this later age may with increasing force affirm that it cannot endure half pagan and half Christian. Flippant and secure in our conceits as at times we seem to be, there are certain immutable and unchanging principles that are not altered or abrogated by the capricious wills of a gainsaying and disobedient people. If with pious unction we grave on our coins, "In God we trust," let us look to it that the legend be something more than an empty platitude to which we pay lip service.

Agnes Repplier's caustic observation may be shocking, but it is pertinent. She says: "America has invested her religion as well as her morality in sound, income-paying securities." It would sometimes seem that the magnifying of material values was the supreme and dominant characteristic of our people, that in "reeking tube and iron shard" we reckoned our security and our peace. We may in our monetary system dispense with a gold standard; we shall hardly survive if we dispense with the standard of the Golden Rule. The much that is required of us may lie outside the proud affirmations of our political platforms and far exceed the pronouncements of our political leaders. Something other than the conservation of forests and soil and the maintenance of land or other values is required of us. It is the conservation and enrichment of human life that is our greatest responsibility. Until this is discharged to the limit of our powers, until every man, woman, and child within our confines shares adequately the much that we have received, and until we of this favored land have played our full part in giving to the world a demonstration of our Christian purpose, we shall prove ourselves unworthy of the great inheritance that is ours.

Let us believe that in the heart of every loyal American citizen there is a longing to make his country the noblest, the most generous, and the most just in all the world. There is here, we believe, a growing spirit of good will, a desire for a more fair and equitable distribution of the gifts and blessings which this land affords. We repudiate the animosities and hatreds which plague Europe today. We are minded to give to all men of every creed and of every political adherence complete freedom to exercise his choice. We covet no neighbor's land or territory, we seek not to impose our customs or our will upon peoples or races near or far. We would bear our just share of the burdens that now and again press heavily upon the less fortunate and the weak. This is what our political and religious faith and ideals teach us; this is what, at its best and truest, America stands for and embodies.

For a country that stretches from ocean to ocean, praise and honor to Almighty God.

For a land of promise whose broad acres have nourished and sustained us through summer's heat and winter's cold, praise and honor to Almighty God.

For wise leaders who have directed the course of the Republic in days of peace and days of strife, praise and honor to Almighty God.

For excelling genius, mechanical skill, and enrichment of the arts and sciences, praise and honor to Almighty God.

For days of adversity that temper the soul and days of prosperity that test our character, praise and honor to Almighty God.

For the love of peace and the pursuit of it, for flag and Constitution, and for an America that moves steadily on to its proud and certain destiny, glory, praise, and honor to Almighty God.

The Late Samuel J. Nicholls

EXTENSION OF REMARKS

OF

HON. G. HEYWARD MAHON, JR.

OF SOUTH CAROLINA

IN THE HOUSE OF REPRESENTATIVES

Monday, November 29 (legislative day of Thursday, November 25), 1937

Mr. MAHON of South Carolina. Mr. Speaker, it is with profound sorrow that I announce to the Members of the House the passing this morning in Spartanburg, S. C., of the Hon. Samuel J. Nicholls, a former Member of the House from the Fourth District of South Carolina.

Mr. Speaker, today I lost another friend—Sam Nicholls passed away this morning. He was the only living former Congressman of the district which I now have the honor of serving. Many of the Members of the House will remember him—he served in this body for three terms, from 1915 to 1921, and retired voluntarily, to be succeeded by my distinguished predecessor, the late John J. McSwain.

I have known Sam Nicholls since my boyhood days, as our home cities are only 30 miles apart, and as we had much in common. He had a very distinguished career. As a young man he was a social leader in his State. In politics he was a real power, having been elected to the State legislature when 21 years of age. He served by appointment as an associate justice of the State supreme court, was here in Congress for three full terms, and at the time of his death was still serving as county chairman of the Democratic Party. He was a civic leader, having served at the head of many organizations, including the bar association, and was just completing a term as president of the Spartanburg County Fair Association.

In his profession Sam Nicholls was on the top round, his law firm being one of the largest and best known in the State of South Carolina. It is interesting to note that of the three members of the firm of Nicholls, Wyche & Byrnes, Mr. Nicholls, as has been stated, came to Congress, Mr. Wyche is now a Federal district judge, and Mr. BYRNES sits at the other end of the Capitol as a very influential Member of the United States Senate. That is a record possibly without parallel. The legal business now falls into the hands of youthful Donald Russell, a more recent junior partner, who, although he has not yet offered for political or appointive position, is regarded as one of the most brilliant of the young lawyers in our State.

Sam Nicholls was loved by all who knew him for he had a kindly spirit and a personality that was unmatched. You will recall, Mr. Speaker, as will the distinguished floor leader here, Mr. RAYBURN, that Sam was one of the most popular men who ever served in Congress. He was especially sought after in the cloakrooms, so I am told, where he kept his colleagues happy always. He served with distinction on the Military Affairs Committee. His interest was largely there,

as he had for many years commanded a company in the National Guard with the rank of captain.

Vigorous, erect, handsome, always smiling, Sam Nicholls was a "regular fellow," a scrapping two-fisted he-man. Always eager to do a good turn for his fellow man, he made and held friends. The last time that I saw him, just a few short weeks ago, he stopped me on the street and gave me a pass to the county fair, suggesting that I would enjoy attending same. It is hard for me to realize that my leaving Washington tonight is for the purpose of attending his funeral. He will be missed in his home city, his county, throughout his State, and measurably throughout the Nation. He leaves a widow, a mother, and two sisters to mourn his passing, along with his thousands of close friends everywhere.

Armistice Day

EXTENSION OF REMARKS

OF

HON. ROYAL S. COPELAND

OF NEW YORK

IN THE SENATE OF THE UNITED STATES

Monday, November 29 (legislative day of Tuesday, November 16), 1937

ADDRESS OF HON. LOUIS JOHNSON, THE ASSISTANT SECRETARY OF WAR, MADE AT THE ARMISTICE DAY CEREMONIES AT THE NATIONAL MEMORIAL AMPHITHEATER, ARLINGTON NATIONAL CEMETERY, VIRGINIA, ON NOVEMBER 11, 1937

Mr. COPELAND. Mr. President, I ask unanimous consent to have printed in the RECORD an address delivered by Hon. Louis Johnson, Assistant Secretary of War, at the Armistice Day ceremonies at the National Memorial Amphitheater, Arlington National Cemetery, Virginia, on November 11, 1937.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

Another year has passed. Again we have stood in devout silence before the Tomb of our Unknown Soldier. Again we have held communion with his immortal soul.

Now we have gathered in this classic amphitheater overlooking row upon row of graves of America's heroic dead to dedicate ourselves anew to the lofty ideals of our fallen comrades.

Their mortal voices have been silenced for many years. Yet above the strains of the national anthem, above the sound of taps, above our voices of song and prayer, there still rings in our ears their dying challenge:

"Take up our quarrel with the foe:
To you from failing hands we throw
The torch; be yours to hold it high.
If ye break faith with those who die,
We shall not sleep, * * *."

Fallen comrades, sleep in peace. Your torch is held aloft in our hands. Your example still shines before us. God grant that when called upon to face a grave national crisis, either in peace or in war, we will meet it with the same loyalty, the same courage, and the same capacity for self-sacrifice that characterized your patriotic lives.

Rest assured, my comrades, both living and dead, that we are striving in every way to prove faithful to the trust that has been bequeathed us. Our efforts do not always meet with success, but we try and shall continue to try to secure the blessings of peace and to maintain the ideals of democracy for ourselves and for our posterity.

It is our wish to quote our first President, "to see the whole world at peace and the inhabitants of it as one band of brothers, striving which should contribute most to the happiness of mankind."

To do our part to avoid war we have tried in every way to give the world an example of honesty and fairness in international relations. With our neighbors in America and with nations across the seas we have cultivated friendship and understanding. Since 1918 we have returned to our shores our soldiers from France, Germany, Italy, northern Russia, and Siberia. No more do we station marines in Latin-American countries. In our relations with other nations we use no force. We make no threats. We do not interfere in the internal affairs of others. We arbitrate. We conciliate. We cooperate. We encourage the reduction and limitation of overburdening military armaments.

We maintain an Army and strive for its efficiency, but we keep it modest in its proportions, too modest to arouse envy or fear among the rest of the nations. If war should come tomorrow, the United States could put into the field, ready for immediate action, fewer than half a million men, fewer than Argentina, fewer than Portugal, fewer than Greece, fewer than Switzerland, fewer than Sweden, fewer than any first-rate power, and fewer than most secondary powers. Contrast our strength and our readiness for immediate striking action with Russia's 19,000,000, Italy's 6,000,000, France's 6,000,000, Japan's 2,000,000, Germany's 2,000,000, and the million of the British Empire, and you will agree that our Army is but a modest police force, neither organized for nor capable of any immediate thrust upon any foreign power.

In short, we strive in every way to keep our national honor free from any mar or blemish that would mock or anger another nation. We endeavor to check the spread of the disease of war from reaching our shores. If it is up to us, the calamity that cut short the lives of our comrades will not be visited again upon ourselves, upon our children, and upon the generations that follow.

Unfortunately, our national example in foreign affairs has not been universally followed. While we have made every effort to keep peace in the world, others, bent on aggrandizement and conquest, have kept the international pot boiling and seething with distrust and fear. In Europe and Asia streets are strewn with dead and dying, fields are devastated, buildings destroyed, business paralyzed, and industry crushed, while columns of hate and fury spread their poison. Who can say in the midst of such international chaos that we may never again be called upon to defend ourselves? If such a moment comes, my comrades, let us now serve notice upon any future aggressor that he will find a Nation united in its efforts, an Army and Navy organized to defend us, and a civilian population mobilized behind the lines to make good the efforts of the man at the front.

For our part, however, we can honestly say that we have kept faith and have made every effort to maintain peace, the blessings of which our fallen comrades cherished most dearly.

Not only in foreign affairs but in our domestic life we have striven to uphold the ideals and the traditions of American life. Freedom of speech, freedom of the press, and freedom of religion we still preach and practice. While in other countries criticism even of petty officials usually results in sentences to concentration camps, or banishment to distant frozen or desert wastes, our writers, our authors, and our actors, without fear or danger, enjoy full freedom of expression, even to the point of satirizing or lampooning our most prominent public men. Editors, columnists, and radio commentators discuss and criticize the daily acts of our Government without any molestation from public officials. Jews, Catholics, and Protestants worship God according to the dictates of their own conscience. Members of all faiths and even agnostics and atheists live side by side happily and peacefully. In few places in the world do men and women enjoy such great freedom of religion and of expression as do the citizens of our own country.

Our Government is stable. We have a reasonable prosperity to a degree almost unknown in the rest of the civilized world. While wars and rumors of war disturb other countries, we enjoy the blessings of peace and of free democratic institutions. Nowhere else in the world today are men and women more secure in their property, more protected in their lives, and more happy in their outlook toward the future than in the United States.

So far we have considered our successes in striving to maintain the ideals and the traditions of our fallen comrades. Of our failures we need say but little except that our efforts have been honest; that we have tried to profit by our mistakes and have endeavored to avoid their repetition. It is enough that we recognize that there is much still to be done before we achieve the full promise of America.

"Man is the conscript of an endless quest,
A long divine adventure without rest,

* * * * *

"Each hard-earned freedom withers to a bond;
Freedom forever is beyond—beyond."

To come nearer in our quest for freedom and the realization of our American ideals, there are a number of things to which you and I can exert our attentions right now. Let us vow to pay no heed to the charlatans who would disrupt our ranks. Let us relegate to limbo the self-seeking agitators who breed intolerance and try to convert honest religious and political differences into feuds of bitterness and hate. Let us pull the masks off the self-anointed messiahs who urge upon us untried concepts of society and of government foreign to our ideals. Let us perfect and strengthen our modest defenses, and let us plug the loopholes so that in case we are called upon to defend ourselves the burdens of war will fall equally and none shall profit. Let us remove the slums which breed disease and crime. Let us strive to give greater health and happiness to our boys and our girls, more opportunity to our men and our women, and greater security to our aged and our crippled.

A year from today we again will assemble here in this amphitheater, and our pledges of loyalty to the faith of our fallen comrades once more will be carried to the homes and firesides of America. I pray to God that all within hearing of my voice here in Arlington and on the radio again will partake in these sacred ceremonies. Let us hope that when another year rolls by we will be able to say that not only have we tried honestly and succeeded modestly to hold high the torch of our heroic dead but that we have made even greater and more effective strides in our march toward a healthier, stronger, and happier America.

Business and the Congress

EXTENSION OF REMARKS
OF

HON. HAMILTON FISH
OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Monday, November 29 (legislative day of Thursday, November 25), 1937

RADIO ADDRESS OF HON. HAMILTON FISH, OF NEW YORK, ON NOVEMBER 24, 1937

Mr. FISH. Mr. Speaker, under leave granted to extend my remarks in the RECORD, I include my address over the Mutual Broadcasting Co. network on Wednesday evening, November 24, 1937, as follows:

Although I am speaking tonight on the subject Business and the Congress, I believe a more appropriate subject would be The Merry-go-round Broke Down. It is about time the New Deal changed its tune from Happy Days Are Here Again to The Merry-go-round Broke Down, as the New Deal goes around and around and around, and comes out nowhere. In this respect it is like the merry-go-round, with its gaudy and flashy trimmings and painted horses to amuse the people and give them a good time while the music lasts, or rather while the money lasts.

The trouble today is that business, not only in Wall Street but on Main Street, is jittery and dizzy from being whirled around and around by the New Deal merry-go-round at Washington, and getting nowhere. We are in the midst of a government of confusion and bewilderment and not even the President's closest advisers have the faintest idea what direction we are going. They have lost all sense of direction, from being whirled around for the past few years and they do not even now know their own objectives.

I am too good an American to wish the New Deal merry-go-round to break down for partisan advantage, because it means unemployment, misery, and destitution for millions of Americans, and disaster for the country. But, I believe it is the duty of the minority to expose the follies, fallacies, and economic failures of the New Deal, and demand that our house be put in order, that the Budget be balanced and that business-baiting be stopped.

Fifty million Americans depend for their living and that of their families on private enterprise, and the New Deal has by its vicious attacks and destructive taxation harassed and hampered business to such an extent that fear and uncertainty have replaced the necessary confidence to expand and employ labor. It is a serious situation, and those who will suffer most are the wage earners. Business is ready to go over the top, if permitted to make profits and pass prosperity around, but the New Deal is entirely to blame for the present depression.

"Out of thy own mouth will I judge thee." The President boasted, "We planned it this way, and don't let anyone tell you differently." This was when business conditions were showing signs of improvement. He naturally claimed the credit for the New Deal but now by the same token and logic he cannot escape the responsibility. This is a Roosevelt or Government-made depression, and even Charlie Michelson and the New Deal publicity bureau and the host of propagandists cannot shift the burden to the international bankers, Wall Street, economic royalists, or other bogeymen.

Persistent baiting of business has flourished under the New Deal. Collectivism, governmental competition, and promotion of class hatred have likewise flourished, all of which were foreign to our American ideals of government. All this must stop, and stop immediately.

The Congress cannot sit around and expect a miracle to happen. We have been in session for 10 days without any program, in spite of being called back by President Roosevelt in special session, on account of urgent necessity, although the necessity has not yet been disclosed. The session to date has been a farce, with little or no prospect of doing anything constructive. Ten days out of the possible 6 weeks have gone with nothing accomplished. In all probability a week will be taken out from Christmas to New Year, and a couple of days for Thanksgiving. This would eliminate 9 more days, leaving 20 legislative days, excluding Sundays.

The President's message referred to encouraging private enterprise to build with aid of Government credit, but no building program has been introduced and no hearings have been held by the committee in charge of such legislation. There has been tremendous Government ballyhoo as to what would be done to help set in motion a private building boom. Only last August the Congress adopted the administration slum-clearance and low-cost housing bill, which was likewise ballyhooed by New Deal propagandists as the solution of the housing situation. Although I voted for the bill, I never liked it, and said so openly, and knew that it would accomplish little.

The Wagner-Steagall bill merely put the Government into building human beehives in big cities without the possibility of private ownership. I pointed out repeatedly that this was the wrong approach to the problem, and that it should have been handled by private industry backed by Government credit.

If the administration is serious or intelligent enough to appreciate the housing needs of the country, which I doubt from past experiences, I hope it will stop building more huge apartment houses. I urge the erection of 1,000,000 small homes on a half acre of land, not exceeding a cost of $5,000 apiece, in the vicinity of our largest centers of population, by use of Government credit. This would do more to curb radicalism, socialism, and communism than anything else. Homeowners are not Communists.

I would favor a bond issue of $5,000,000,000, and believe it would be the best and safest investment ever made in both humanitarian welfare and good citizenship. The details could easily be worked out as to whom to entrust the funds, whether building and loan associations, savings banks, building companies, or other authorized organizations. The interest rate should be as low as possible—around 3 percent—and for at least 20 years. To save interest charges it might be proper to use a part of our surplus gold now buried in a Kentucky vault.

Great Britain and other nations, such as Germany and Sweden, have engaged in huge housing programs and we can learn from their experiences. We may have to loan direct to building companies. It would be an easy matter to arrange to have all mortgages guaranteed by the Federal Government.

If other great nations can pull themselves out of a depression by use of government credit to build homes for their wage earners, then we can do it in the United States. The time to begin is at once, and the way to begin is to begin.

Four years ago President Roosevent stated that one-third of our people were ill-housed, and if that is so, then he has been derelict in not proposing a proper, sound, and adequate housing bill instead of the makeshift that was enacted into law at the last session of Congress.

The American people are looking to Congress for immediate action, to lead the country back to recovery and employment. Will these hopes be justified, and will Congress do something constructive to help solve the economic situation, restore confidence, and bring about a revival of business? I reluctantly and regretfully believe that this is just another mirage. I would much prefer a prosperous America than to benefit politically from a depression, but there is no reason or basis upon which to expect anything from the present utterly confused Congress. It is perfectly obvious to all classes of Americans that the Congress should get on its hind feet and legislate away some of the unfair and unjust taxes levied on business. But will they? No, certainly not at this session!

They should immediately modify both the undistributed-profits tax and capital-gains tax, as a token of good will toward business. Instead, the Congress will dawdle along and waste time and money doing nothing. It is a sad commentary on the Congress, but, unfortunately, it has made a record for sheer incompetency and inaction that has not been equaled in the memory of man. It will take more than a mere revision of tax laws to pull the country out of the Roosevelt depression. Tax revision is just a step in the right direction, but not the cure. It would be a mistake to think of tax revision as more than the whipped cream, for that is all it would be and nothing more.

To restore public confidence and encourage private enterprise to make profits and employ labor needs a different governmental approach or psychological attitude. It requires a willingness to help business instead of trying to wreck our industrial system by visionary and unsound experiments, punitive taxation, and ruinous restrictions.

With $30,000,000,000 of security values on the stock exchange wiped out, and probably an equal sum in unlisted securities, we are not merely facing a depression, but we are actually in a depression, for which the New Deal is solely responsible. There is no rhyme or reason for it. We have all the natural resources and loyal and industrious labor that we had back in 1929, and after 7 lean years ought to be enjoying prosperity and the beginning of 7 fat years.

With steel production at 31 percent, the lowest since the economic collapse of 1932, with building at a standstill, and carloadings decreasing every week, the administration cannot afford to be blind to facts that everyone else knows.

The genesis and genius of the New Deal is one man. President Roosevelt has seized the controls and has unprecedented power over the value of money, banking, industry, commerce, and agriculture. Will any ardent or even fanatical New Dealer deny that if the country prospered that the New Deal would have been entitled to the lion's share of the credit? I admit my own error, because I thought that even New Deal fallacies and economic blunders could not wreck our country on account of its great resources and potential wealth. I did not anticipate a depression, at least until after a few years of real prosperity and employment.

This depression is not due to years of prosperity, employment, and overspeculation. It is a Government-made, or a Roosevelt depression, and I do not propose to mince words. On the other hand, I do not want to infer that at the start, back in 1932–33, that many much-needed reforms such as regulation of the Stock Exchange and of the Securities Exchange were adopted. I also

favored the Home Owners Loan Corporation Act, Farm Loans, the C. C. C. camps, and more recently, Social Security and old-age pensions.

The duty of a minority is to give public utterances to justifiable criticism, so that the people back home will know the facts, and decide whether they want to continue to throw overboard our American system, based on private initiative and reasonable profit, which has made America the greatest, richest, and freest Nation in the world, and our wage earners the best paid, best housed, best clothed and most contented, or to follow the pattern of European dictatorships of either the left or the right into collectivism, bureaucracy, and state socialism. The American people must decide the issue and let the chips fall where they may.

To sum up, I submit the following direct charges, without mental reservation or evasion; the record has been made, and let the facts speak for themselves:

I accuse President Roosevelt with being responsible for the loss of $30,000,000,000 in security values on the stock exchange, and probably another $30,000,000,000 of unlisted securities in real estate, mortgages, and so on, in the last 2 months, which means further unemployment and impoverishment of American labor.

I accuse him of destroying business confidence by repeated attacks, destructive taxation, squandermania, red tape, reprisals, and by governmental competition with business.

I accuse him of causing business fear and uncertainty by inciting class hatred and more strikes than any administration in the history of our country.

I accuse him of trying to control and socialize our entire financial and economic structure through bureaucratic regimentation at Washington.

I accuse him of hampering and retarding the natural recovery of the country through half-baked legislation, unsound experiments, squandering of the people's money, and an unbalanced Budget.

I accuse him of having lost the cotton and wheat markets of the world, causing an unfavorable trade balance of $147,000,000 the first 6 months of this year, for the first time in more than 50 years, to the detriment of our farmers and wage earners.

I accuse him, instead of providing a more abundant life, of giving the American people more abundant promises, taxes, debts, deficits, high cost of living, class hatred, collectivism, unemployment, and impoverishment.

I accuse him of having no financial or fiscal policy, except to pile debt upon debt, deficit upon deficit, and to borrow billions upon billions by issuance of tax-exempt securities, until the national debt has reached the stupendous sum of $37,000,000,000.

The present Government-made depression permits no delay. Delays are too dangerous. Congress must act at this session, not next year, to restore confidence, stimulate private industry, and revive employment of American labor.

Undistributed-Profits Tax—Tax Without a Friend

EXTENSION OF REMARKS

OF

HON. EMANUEL CELLER

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Monday, November 29 (legislative day of Thursday, November 25), 1937

RADIO COLLOQUY BETWEEN HON. WILLIAM H. KING, UNITED STATES SENATOR FROM UTAH, AND HON. EMANUEL CELLER, CONGRESSMAN FROM NEW YORK, NOVEMBER 26, 1937

Mr. CELLER. Mr. Speaker, under leave granted to extend my remarks in the RECORD I include the following radio colloquy between Hon. WILLIAM H. KING, of Utah, and Hon. EMANUEL CELLER, of New York:

The ANNOUNCER. Since Congress was called in special session a week ago the subject of taxation has dominated all other questions in the minds of Senators and Congressmen. In the forefront of discussions on this subject has been the so-called corporate undistributed-profits tax. In line with its policy of presenting current discussions on outstanding subjects, the Mutual Broadcasting System this evening takes pleasure in presenting a colloquy between Hon. WILLIAM H. KING, United States Senator from Utah, and Hon. EMANUEL CELLER, Congressman from New York. Both of these representatives have introduced bills in Congress calling for substantial amendments to this tax. Senator KING, after many years of public service, was elected to represent the State of Utah in the United States Senate in 1916 and has served continuously in that capacity for the past 20 years. He is ranking member of the Senate Finance Committee. Congressman CELLER, likewise, after many years of public service, was elected to Congress to represent the Tenth District of New York in 1922 and has served continuously in that capacity for the past 16 years. The Congressman is a member of the House Committee on the Judiciary. The discussion will be opened by Senator KING.

Senator KING. In my many years of service in the United States Senate I have never observed more unanimous feeling on any particular piece of legislation than exists at the present time for the repeal of, or, at least, for substantial amendments to, the undistributed-profits tax.

Congressman CELLER. My observation of the Congress leads me to the same conclusion.

Senator KING. More than a year has elapsed since Congress passed this measure, and during that period we have been able to watch the actual operation of the tax and appraise its effects upon business. More particularly we have been able to observe the hardships wrought by certain of its provisions which must be changed immediately. Today it is rightly called "the tax without a friend."

Congressman CELLER. When the tax was originally presented we were told that it would be a sort of painless tax. Experience has shown us that the Government with this tax is very much like the so-called kind mother who gave her son chloroform before spanking him. This tax was to create better distribution of wealth and other economic reform. In that it has failed. Frankly what we need in Washington is more reform in taxation rather than reform through taxation. Will you explain this tax, Senator?

Senator KING. Briefly, corporations are required to pay a normal tax levied upon net income of from 8 to 15 percent, and the surtax, or undistributed-profits tax, is an additional tax of from 7 to 27 percent upon the net income. Corporations are thus compelled to pay approximately 32 percent as taxes upon their net income which is not distributed in dividends. In other words, the undistributed-profits tax is a fine or penalty upon corporations that desire to retain earnings to meet debt obligations or business expansion instead of distributing them to their stockholders.

Congressman CELLER. Exactly; the greater the proportion of earnings retained the larger the tax rate.

Senator KING. The avowed purpose of the tax was to force corporations, regardless of their needs and their welfare, to pay out their earnings in dividends upon the theory that large stockholders would then pay income taxes. It was also argued, but proof was wanting, that this tax would yield greater revenues to the Federal Treasury.

Do you believe, Mr. CELLER, that this law achieves these purposes?

Congressman CELLER. No; as Bobbie Burns, the poet, said, "The best laid schemes o' mice and men gang aft agley." Like many other acts designed to accomplish two divergent aims, it doesn't succeed in either. This act attempts to reform corporation practices to cut down avoidance and increase Federal revenue. Experts inform us that as a revenue producer, it has been a disappointment. As for curing tax avoidance, the cure, apparently, is worse than the disease. The tax does not apply to individuals or partnerships, and many corporations are now casting off their corporate forms as a means of escape. Unincorporated entities go scot free. A method of avoiding the tax occurs if unnecessary expenses are unduly magnified, as it results in decreasing profits for distribution. Another avenue of escape is in incorporation in foreign countries.

Senator KING. This law ignores and indeed defies accepted economic traditions and practices of setting aside reserves for rainy days. Undoubtedly this tax prevents the building up of reserves for rainy days, for periods of depression, and to meet the hazards incident to all business enterprises. Had it not been for reserves accumulated by corporations, the depression, serious as it was, would have been infinitely more devastating. The fact is that for the years 1930–33, inclusive, corporations sustained losses of more than $9,100,000,000. Yet during this period many of them continued to operate, thus employing labor, because of accumulated earnings. These accumulated earnings saved the country from a more serious and destructive depression.

Congressman CELLER. Quite true. Furthermore, the bill, in the first place, restricts the expansion of business, prevents a corporation from using its own accumulated profits, upon which it has already paid a tax, to pay for improvements and enlargements of capital assets. This has a decided tendency to stop corporation growth and to check reemployment. As you indicate, this tax penalizes thrift and impairs the ability of corporations to withstand depressions. With no reserve, pay rolls are reduced all the more quickly in times of economic difficulties. Unemployment is quickened. Labor, ordinarily, is the first to be affected in any business decline. This tax emphasizes the danger. Thus, work and jobs are reduced. Labor inordinately suffers.

Senator, are farmers adversely affected?

Senator KING. Undoubtedly they are. Industry and agriculture are so linked that injuries to one seriously affects the other. If wages are reduced in industry, jobs are reduced, and the demands for farm products are also restricted. The farmers are concerned about markets and must suffer if they cannot dispose of their commodities.

Do you believe the act affects all corporations in the same way?

Congressman CELLER. No; the act especially penalizes the small, growing corporations and the weak corporations who are in debt. Certainly, it is reasonable to expect that older established corporations with stable earnings will be less concerned about plowing back a part of their earnings than small, growing corporations or corporations with fluctuating earnings. Young, growing corporations need large funds for expansion and often they cannot get these funds except by the reinvestment of their earnings.

The minute small business uses its earnings for future growth instead of disbursing them the penalty tax applies. Furthermore, it is clear that small corporations cannot float bonds or issue stock as readily as can large corporations that have a name and whose securities are listed on the stock market. In a way, it assures large, monopolistic concerns that no potential competitors will be able to grow to a point where they will offer serious competition. Of course, the tax as it now stands tends to check the growth of the larger corporations as well as the small ones, but the little fellows find it much harder to bear than the big ones.

SENATOR KING. I understand it is claimed that some corporations should distribute as dividends a larger share of their earnings, and that upon the other hand many corporations for their own protection and the welfare of their stockholders should build stronger financial structures by increasing their reserves before distributing earnings, thus guarding against future business difficulties.

Congressman CELLER. That's the rub. The Government regulation should work both ways, but, unfortunately, under this law, because of the penalties involved, dividends equal to a very large proportion of the earnings will be paid, regardless of the financial position of the corporation. In other words, this tax assumes a sort of uniformity among all corporations, a uniformity that does not exist. The tax, to the extent that it presumes uniformity, is, therefore, inequitable.

Senator KING. It is your contention that the present law discriminates against corporations with debts?

Congressman CELLER. Yes; it certainly does. Many corporations have been steadily losing money. They have many debts. If profits come, they must distribute them as dividends. If they pay, instead, their debts, they incur this tax liability. The day must come when their creditors will demand payment and this may force many into bankruptcy. There are no provisions in the tax measure granting relief in such cases.

Senator KING. That is true. The present relief provisions are not only inadequate but they utterly fail to meet existing economic conditions. The law exempts (1) the payment of tax by corporations which are in bankruptcy and (2) are insolvent and in receivership. Many States forbid corporations with impaired capital from declaring dividends, and yet the Federal Government taxes such corporations for the privilege, nay, duty, of obeying the State laws. An absurdity of the relief provisions appears when it is realized that corporations may be in receivership but not insolvency. Yet, to be exempt from the tax, the corporation must be both insolvent and in receivership. In the case of solvent corporations which are in the hands of the receivers, there is presumably an attempt being made to keep the corporation from insolvency and to strengthen its finances. The courts would never allow corporations in this position to declare dividends, yet the tax is levied upon such corporations. The absurdity of taxing such a corporation for the privilege of living up to a court order should be apparent to all.

Congressman CELLER. Undoubtedly the law will have to be modified in this connection, since it does appear that at present it does conflict with the State laws. The present law has also been criticized because it removed a much-needed cushion in times of future depressions. Do you believe that it is desirable to permit corporations to put aside part of their earnings in good years to be used as a reserve for bad years?

Senator KING. Wealth is the result of thrift accompanied by savings, yet by this law we are penalizing those who practice thrift and conserve earnings. Our present problem will largely be solved by saving money and capital during good times.

Congressman CELLER. Suppose you summarize the amendments provided for by your bill.

Senator KING. I opposed the undistributed-profits bill, believing that it would prove harmful to business and to the country. In January last I offered S. 979, providing amendments to the undistributed-profits bill. One of the amendments provided that corporations should receive credits equal to all amounts paid within the taxable year in the discharge of debts or irrevocably set aside within the taxable year for the discharge of debts. It also provides for credits of the sum of the amounts paid out during the taxable year for the construction or improvements of real property, and for the purchase and the installation of equipment and machinery, and for the expansion or replacement of plant or other productive facilities (including amounts paid out for the equipment and development of mining properties) to the extent that no deduction or allowance is or has been made for such amounts in computing net income. It also provides that these amendments shall apply to income during the taxable year 1937.

Congressman CELLER. I think those provisions are excellent, but in my bill, known as H. R. 7550, I have suggested the same changes and in addition thereto a general credit not to exceed 30 percent of the adjusted net income of the corporation. I have also included a provision whereby a corporation may distribute up to 25 percent of its adjusted net income within 90 days following the close of the taxable year.

Senator KING. I believe those additions are entirely reasonable. The latter amendment has been called by many accountants the humane provision, since it would allow the corporation a reasonable time to prepare their statements and to appraise their financial and cash positions. The present law requires them to distribute all dividends before the end of the year if they are to receive any credit for these dividends.

Obviously, this is almost impossible, unless corporation officials resort to guesswork, which has no place in determining tax responsibility. I firmly believe the passage of these bills by Congress would not only check the present business recession, but would lay the foundation for a sound business revival. The adoption of these measures by Congress would enable corporations to replace outworn machinery and buildings without the necessity of borrowing money, since this process entails an extra cost which these bills save to the manufacturer.

Congressman CELLER. Our President recently called attention to the lag in the durable-goods and heavy-industries groups, and urged the development of a large-scale housing program as a means to stimulate business recovery. The President expressed the thought that housing construction was dormant because we had not applied to that field the American principle of mass production. In my opinion, the principal reason for this lies in the provisions of the undistributed-profits tax which will not permit the use of dormant capital for this or other expansion purposes.

Senator KING. Corporations must be encouraged to take up the slack brought about by the lessened spending of the Government, and corporations must be given fair treatment in any proposed tax revision, so that they may be permitted to operate without being shackled by the Government. This treatment must be fair to all corporations and should be extended to them alike, regardless of size or other factors.

Congressman CELLER. Just one thing more, Senator. Do you believe Congress should take action on these measures during this special session?

Senator KING. Indeed I do. Personally I should like to see the undistributed-profits law repealed but if this is not done then I think the most constructive thing that Congress could do to restore waning confidence and to extend the gains in the business world that have been obtained during the past two years, would be for the Congress to pass these bills at this special session, thus applying the remedy to tax returns for the current year, and not wait for the regular session beginning on January first next. Much depends, however, on how many of the radio audience express their wishes and tell their Senators and Congressmen whether or not they want them to pass these bills now.

Repeal the Undistributed-Profits Tax Now

EXTENSION OF REMARKS

OF

HON. JOSEPH W. MARTIN, JR.

OF MASSACHUSETTS

IN THE HOUSE OF REPRESENTATIVES

Monday, November 29 (legislative day of Thursday, November 25), 1937

RADIO ADDRESS BY HON. ALLEN T. TREADWAY, OF MASSACHUSETTS, NOVEMBER 26, 1937

Mr. MARTIN of Massachusetts. Mr. Speaker, under the leave to extend my remarks in the RECORD, I include the following:

The undistributed-profits tax is one of the most unsound and injurious pieces of legislation which the New Deal administration has yet put upon the statute books. It ought to be immediately repealed. Modification is not enough. When a thing is wrong in principle, as in the case of this alleged taxing measure, no compromise is possible.

Every once in a while public sentiment on some important issue crystallizes so fast and becomes so overwhelming as to demand prompt consideration. Such a situation has been developing for the past few weeks in regard to the undistributed-profits tax. I have never seen public opinion so rapidly aroused or so intense as the present feeling with respect to this measure. Tax laws are the source of much difference of opinion among lawyers, economists, and the courts, but here is a case where practically all working men and all small corporations realize that they have been injuriously affected by the imposition of this indefensible levy. Today the country is united in its demand for the complete repeal of the undistributed-profits tax.

To those who are unfamiliar with the complexities of our Federal revenue laws, let me say that the measure to which I refer is another impracticable New Deal experiment under which business is taxed, not upon earnings but upon savings. The tax, which is really a penalty, is imposed in addition to the regular corporate income tax, and applies, at graduated rates running up to 27 percent, to that portion of a corporation's current earnings which are not distributed to the stockholders in the form of dividends.

No allowance whatever is made for the fact that a corporation—for one reason or another—may not desire or be in a position to distribute its earnings after payment of the income tax. It may have to use them for the payment of debts, but if it does so it

becomes subject to the heavy penalty tax on undistributed earnings. It may have to restore its capital structure as a result of a series of losses during the depression years. Again the penalty tax would apply to the earnings used for that purpose. The same thing would be true if the company used its tax-paid earnings to build up a reserve for a rainy day. The penalty tax likewise attaches to earnings used for new plant facilities or the rehabilitation or modernization of existing facilities.

Perhaps the most outrageous application of the penalty tax is to corporations which are insolvent, and which, under the laws of many States, are restricted under penalty of fine and imprisonment from paying out dividends. They are penalized by the Federal law for obeying the State law.

The avowed purpose of the undistributed-profits tax, according to its sponsors, was to force the distribution of corporate earnings to the stockholders. Keep in mind that corporations still had to pay the regular income tax. Yet after having done this, they are not free to use their tax-paid earnings as good business judgment might dictate. The Federal Government steps in with this penalty tax on undistributed profits and attempts to tell them how the financial affairs of the business shall be run.

Even if it were desirable that all corporate earnings be currently distributed, in order that the Government might get additional revenue from those to whom the corporate dividends would be paid, a still greater benefit would accrue, in my opinion, by permitting business concerns to use these earnings, after payment of the regular corporate income tax, for purposes of expansion and rehabilitation. The money would then be put directly into the channels of trade and industry, giving employment to the idle and creating an increased market for goods and services, particularly in the heavy industries where most of the lag now exists.

When the undistributed-profits tax was proposed to the Congress last year, I joined with my Republican colleagues on the House Ways and Means Committee in filing a dissenting report expressing our vehement opposition to the measure. When the bill was before the House, the Republican membership voted solidly against its passage. But, of course, the huge Democratic majority—subservient as usual to the wishes of the White House—enacted the bill into law despite its obvious defects. The responsibility for the measure and the damaging effect it has had upon the country lies entirely upon their shoulders. To use a common expression, It is their baby, not ours.

Let me just refer to some of the objections which the Republican members of the House Ways and Means Committee made to the bill last year. After asserting that the bill was unsound in principle and expressing the opinion—since confirmed—that it would undermine business stability, we listed 14 very definite criticisms. For example:

We said that the undistributed-profits tax constituted a direct threat to the security of business, employment, and investments—and it has. The present "Roosevelt slump" is largely due to the ill-effects of this iniquitous tax. Business is jittery, unemployment is again on the increase, and investors have lost heavily and are unwilling to take a chance on the future. Securities have declined some twenty-five or thirty billions in value.

We said that the undistributed-profits tax would discourage business rehabilitation and expansion, and have a retarding effect upon recovery and reemployment—and it has. Millions upon millions of dollars would have been spent on new-plant facilities—new machinery, new equipment—and upon the rehabilitation and modernization of existing facilities, except for this penalty tax upon such expenditures. Thousands upon thousands of jobs would have been created, both directly and indirectly. Thus labor, which would be the chief beneficiary of such expenditures, has a just grievance against this repressive measure.

We said that the undistributed-profits tax would discourage and possibly prevent the accumulation of needful reserves, and it has. Reserves are the life-insurance policies of business. During the last depression business concerns in thousands of instances were enabled to keep their doors open and meet their pay rolls only because they had set aside a reserve in good times, which they paid out to the extent of $26,000,000,000. Think what will happen if business has to enter another depression entirely stripped of its reserves.

We said that the undistributed-profits tax would hamper the growth of small corporations, impede the development of new enterprises, and foster monopoly, and it has. Business concerns ordinarily expand by "plowing back" their earnings instead of distributing them. The undistributed-profits tax imposes a heavy penalty on earnings used for this purpose. As a consequence the tax tends to freeze business concerns at their present size, thus preventing small corporations from ever becoming competitors of the larger companies.

We said that the undistributed-profits tax would crucify financially weak enterprises while permitting the strong to minimize their tax burden, and it has. The large corporations which have adequate reserves can afford to distribute their entire current earnings and thereby avoid the penalty tax. Small corporations, struggling to keep their head above water, must retain their earnings and pay the penalty tax.

We said that the undistributed-profits tax put a penalty on prudence and a bounty on improvidence and constituted an unwholesome interference with the exercise of sound judgment in the management of business, and it has. It offers a bounty of tax exemption to corporations which throw prudence to the winds and pursue a loose fiscal policy while imposing the tax on corporations operating on a businesslike basis. This kind of Government interference with business is not only obnoxious but downright dangerous.

We said that the undistributed-profits tax would oppress corporations burdened with debt—and it has. A measure which puts a penalty on debt payment has no place in our tax structure. Under the law, the more debts a corporation has to meet, the higher becomes the penalty tax on earnings used for that purpose. The Government, in effect, is putting a tax on honesty and hard luck.

We said that the undistributed-profits tax violated every sound principle of taxation—and it does. A cardinal tax principle is that the burden should be adjusted according to ability to pay. The undistributed-profits tax is directly contrary to this just and equitable rule. It is based not on ability to pay but on inability. It falls heaviest on the small, struggling corporation, and does not apply at all to the large well-to-do company, which does not need to retain any of its current earnings.

We said that the undistributed-profits tax would be unequal and discriminatory in its operation—and it has. Two companies with the same income will pay different penalty taxes, depending upon their respective ability to distribute their current earnings. Likewise, a company with a small income may pay more tax than a company with a much larger income. Thus, the tax operates to give one company a competitive advantage over another.

We said that the undistributed-profits tax would be disappointing as a revenue measure—and it has. But this is not surprising when we consider that it is primarily a regulatory statute.

The defects in the undistributed-profits tax to which I have referred deal for the most part with general principles. I have not mentioned the many administrative difficulties to which it has given rise.

The results of the first year's experience under the undistributed profits tax law completely vindicates the Republican Members of Congress in their opposition to the enactment of this ill-conceived measure. Such being the case, we of the minority party are justified in demanding its complete repeal, rather than any halfway steps in the direction of modification. It is absolutely wrong to start with, and no amount of modification will make it right or acceptable. In this respect it very much resembles a bad egg.

I am glad to say that at a conference of Republican Members of the House of Representatives, held only this week, a resolution was unanimously adopted favoring the immediate and unconditional repeal of the law, retroactive to January 1 of this year.

It is encouraging to see that so many of our Democratic colleagues have at last seen their mistake in enacting the measure into law, but, of course, they still will not publicly admit it. Even the President and his Secretary of the Treasury have conceded the necessity for revision of the law. The willingness of the Democratic leaders to do this, however, is simply the result of the storm of public protest. But in order to save the administration's face, and so as not to be put in the position of confessing their error, they still insist on retention of the principle of the undistributed-profits tax in some degree.

The undistributed-profits tax is a classic example of what happens when the Government tries to use its taxing power for purposes other than the raising of revenue. I believe there can be no question but what the repeal of this law, immediately and unconditionally, would be one of the most helpful steps that Congress could take toward business recovery and the restoration of confidence. It would have very much the same result as did the invalidation of the N. R. A., which marked the beginning of the recovery that had been achieved up to the time of the present slump. The undistributed-profits tax has had the same depressing influence on business as that act, perhaps even in a more marked degree. It has held business back. It has hamstrung the little fellow. It has not only destroyed the opportunity for increased employment, but actually caused more unemployment. A gigantic reservoir of business spending will be released when the undistributed-profits tax dam has been blasted away. The Government will benefit by increased revenues from business income. Wage earners will benefit by assured employment. The unemployed will benefit by the creation of new jobs. Investors will benefit by the strengthening of the financial structure of business.

Nothing but good will flow from the repeal of this vicious measure. Nothing but bad will result from its continuance, even though it be drastically amended. It constitutes a dangerous threat to the economic stability of the Nation, and will likely precipitate, if retained, a business collapse which may reach even greater depths than the depression from which we were lately emerging. The present downward spiral has fortunately awakened the country to the need for the repeal of the undistributed-profits tax before it is too late.

In the course of these remarks, I have referred to the interest of the workingman in the repeal of this law. While the tax does not directly affect him, he has a vital interest in its effect on his present or prospective employer. He is interested in the security of his job in times of stress, and unless his employer is permitted to build up reserves in good times he will have nothing out of which to pay wages when times are bad. The man who is without a job is interested in securing work in order that he may provide a decent living for himself and his family, but unless business and industry are permitted to use their earnings for purposes of expansion, very little expansion will occur, because at present there is no other way for most business concerns to get the money for that purpose.

My chief interest in the repeal of the undistributed-profits tax lies in the beneficent effect it will have upon the workingman and

the small-business man. I suppose no section of the country has a larger proportion of small business and manufacturing concerns than my own. These concerns give employment to thousands of workers, who in turn furnish a market for the products of our farms. It is the workers and the small business concerns who have been particularly hard hit by the undistributed-profits tax, and it is for their benefit—and the benefit of the Nation at large—that I hope to see it repealed at the present session of Congress.

I thank the Columbia Broadcasting Co. for its courtesy in granting me the opportunity to speak over its coast-to-coast facilities upon this important subject, which in my opinion should receive the immediate consideration of the Congress so that the undistributed-profits tax can be repealed—now.

Congressman Celler Battles for Consumer—Charges Drug Association With Suppressing Facts Helpful to Consumer

EXTENSION OF REMARKS

OF

HON. EMANUEL CELLER

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Monday, November 29 (legislative day of Thursday, November 25), 1937

Mr. CELLER. Mr. Speaker, under leave granted to extend my remarks in the RECORD, I include the following:

STATEMENT

Calling to the Federal Trade Commission's attention alleged efforts by drug retailers to force wholesale newsdealers to withdraw certain magazine articles addressed to consumers, Congressman EMANUEL CELLER, of New York, asked its chairman, Judge W. A. Ayres, to investigate. The New York Congressman stated he considered the allegations reported to him as "sinister," because they apparently involved an attempt to actually censor consumer channels of information.

Congressman CELLER offered to supply the Commission on request with the names of the State drug trade organizations and of the magazine wholesalers which have been complained of to him. He then proceeded to name names in connection with a $25,000 check alleged to have been paid into a retailers' lobby fund by a national manufacturer.

He requested the Commission to ascertain whether or not the retailers were fearful of the reproduction of this check for $25,000. The Congressman stated it was alleged to him that this check, reproduced in the magazine he said he had been told they asked the wholesale newsdealers to recall, had been cashed by the retailers' national organization and used to lobby for State price maintenance laws and the national Miller-Tydings price maintenance amendment which the President signed with distinct hesitation last summer after it had gone through the Senate as a last-minute rider on an appropriation bill.

The Congressman asserted that a nationally known manufacturer had paid the check after undergoing a boycott at the hands of irate dealers who did not consider his retail prices high enough.

He therefore wanted the Commission to find out if there was any connection between this reported boycotting, the later issuance of the check, and the alleged withdrawal of the magazine containing a photograph of the check.

The New York Congressman also asked the Commission to check into allegations that California druggists were practicing a boycott by camouflage. He told the Commission he had been informed the coast druggists distribute window placards listing manufacturers who have fixed resale prices in consultation with the druggists collectively. We wrote the Commission he feared such methods might spread into interstate commerce.

Congressman CELLER stated to the Commission, in explanation of his action, that it was "based entirely on a belief that in the end it is the small man who will be most directly harmed by exploitation of the consumer through price-fixing coercions."

"I have long stood," the Congressman continued, "and now stand, for protecting the small merchant from unfair and predatory practices. I go further, and stand for protecting the small merchants' gross profits to even an extent sufficient to cover known minimum wage and rental expenditures. And going still beyond such protections, and reaching far deeper than they reach, I stand for liberal expenditures for providing the small merchant with operative knowledge and buying facilities which will enable him to do business more effectively. I firmly believe the small merchant should have assistance as practical and as useful in a dollars-and-cents way as that made available to the farmers.

"Given such assistance, the average American merchant can stand on his own feet and meet competition without asking for a prop in the shape of laws levying on consumers for his benefit. The American merchant is amply able to take care of himself if given an even break, but a break in the shape of price controls that amounts to a levy on the consumer is neither fair to him nor to the consumer. He will only benefit in the end from a break which enables him to serve the consumer effectively; he can only ultimately suffer from a break which necessitates disservice to the consumer."

The New York Congressman stated he believed the Commission could secure the information he desires while making the high cost of living and monopoly investigation which the President recently requested it to undertake.

"My letter of March second, as a matter of fact," he wrote the Commission, "requested, in specific terms involving a specific industry, exactly what the President now requests for all fields, and it is my hope that in supplying the President with the information he requests you will, as a matter of course, and without additional expense, obtain the information for which I have asked."

LETTER

NOVEMBER 29, 1937.

Hon. W. A. AYRES,
Chairman, Federal Trade Commission, Washington, D. C.

MY DEAR CHAIRMAN AYRES: I must again direct your attention to the activities of the National Association of Retail Druggists. This is the same organization whose activities I felt constrained to call to your attention last August in connection with its plans, as then announced, for aiding manufacturers in fixing resale prices for their products, while officially committed to uniform maintained prices assuring drug stores a profit of at least 50 percent on cost. It has ostensibly at least retreated from its legislative objectives after attempting to put them immediately into force after passage of the Miller-Tydings amendment had been obtained under pressure from its members and the members of other associations interested in fixing profits under cover of entirely legitimate motives for curbing predatory loss-leader selling.

I hope that the attention which I called to the plan this organization had embarked upon led to this change of front, for these plans were obviously improper, and, if persisted in, could only have led to considerable embarrassment for those involved, which, in turn, would have dealt a serious blow to the real interests of the small merchant and any sincere effort to protect him from unfair or predatory trade practices.

As you know, this particular association has for years stood, and still stands, under the shadow of a Federal injunction against price-fixing activities. Despite this, the association officially, on November 10 to 12 a year ago, through its executive committee, meeting at the Sherman Hotel in Chicago, embarked on a campaign to fix prices, profits, and discounts at levels which would assure even the small purchaser 50 percent on the cost of goods to him, and as well to bring about uniform resale prices throughout the entire United States on all articles sold by manufactures who availed themselves of the so-called fair-trade or price-maintenance laws which the association was pushing before the legislatures of the country.

For your confirmation of this extraordinary and bold essay at national price fixing—attempted in the face of a Federal injunction, moreover—you have only to call for and examine the official journal of the association, particularly the issue of almost exactly a year ago—that of November 19, 1936, pages 1614 to 1616. It is obvious that this scheme could not succeed unless implemented by national legislation and assisted by the other branches of the industry, either willingly, as in the cases of most wholesalers, or under trade pressure, and indirect threats of boycott, as in the cases of not a few manufacturers. It is equally obvious that for perfecting their plans considerable sums of money would be necessary, and that this money would have to be obtained from small retailers who would contribute it under the impression they would obtain the 50-percent-profit margin as the result of carrying out exactly the sort of methods which I brought to your attention last August.

From the day of that meeting in Chicago until the last session of Congress adjourned, a concerted drive was in fact carried on in Washington, and in many State capitols, to obtain the legislation necessary to make the scheme workable. The small retailers put up their money—and they put it up for the reason I mention and in the expectation of gaining exactly what I mention. Wholesalers and manufacturers contributed to the war chest—one manufacturer, and a very powerful one, had been so effectively boycotted, indeed, that he "kicked in" with a check for $25,000. Other interests outside the drug field, I am informed, attracted by the possibilities of artificially controlling prices, contributed also, although acting independently, and in at least one instance may have brought, by check-book generosity, most potent assistance to the drive.

The Miller-Tydings amendment is the Federal legislation that had been conceived to implement this scheme. It masqueraded under all that is good in legitimate price maintenance and the outlawing of predatory loss-leader selling. But in fact it was conceived by these interests to implement this price-fixing scheme upon which they had embarked between November 10 and 12 a year ago, in the Sherman Hotel, at Chicago.

You are well aware that these interests were able to force the Miller-Tydings amendment through Congress against the questioning not only of the President and your Commission but of important members of the administration. The President stated in a formal memorandum which he issued on signing the appropriation bill into which the Miller-Tydings amendment had been interjected by trick, in rider form, as a last-minute means of securing its passage, "I have distinct hesitation in approving the rider which weakens the antitrust laws."

Since apparently a partial explanation of the present right-about-face among those who set up November a year ago the objectives to which I call attention, and adopted last August the clearly illegal plans I brought to your attention, lies in their fear that the revision of the antitrust laws for which the President has now asked will weaken their real position, this earlier direct statement by the President that their legislative drive has weakened the antitrust laws does assume great significance.

This pressure group was finally forced, by a belated awakening among consumers, to resort to those technicalities of the Senate rules which I have mentioned to secure passage of their measure; and, what is more important for practical purposes, their lobbyists, it has now been disclosed, were forced, I believe largely as a result of the publication of the Commission's letter to the President regarding the legislation, to promise many Members of the Congress the legislation would not be used as their association had officially undertaken to use it at the meeting at the Sherman Hotel in Chicago during November a year ago.

As a result the leaders of this drive, when they called their August "victory" meeting after the Miller-Tydings amendment had secured the President's signature only at the cost of the earnest warning from him which I quoted above, found themselves in the difficult position of having been smothered in the very smoke screen of worthy motives under which they had hidden their real objectives before the Congress. They could not claim to their association members that they had obtained what they had been paid to obtain, because they had been forced actually to certify to their quite worthy smoke-screen promises. On the other hand, they could not fully disavow what they had set out to do for fear of being set upon by those they had represented.

They were in a difficult position, having professed one thing and having undertaken another.

They had, of course, to make a show of going through with what they had undertaken, and that they did, again at Chicago, this time at the Sherman Hotel, and on August 30 and 31 of this year. And although but a gesture, it was a gesture that might be deemed by some illegal enough to land them squarely in contempt of the Federal injunction in the shadow of which they had had the effrontery to embark upon their scheme.

It was these plans undertaken during the last 2 days of August which I brought to the attention of the commission.

And what an opportunity some of those who had campaigned for the Miller-Tydings bill during the last session were now afforded! They could, with all seriousness, warn their allies of the previous session that they had, of course, never for a moment understood that anything but the most worthy of motives had ever been involved! As a matter of fact, several went to the delightful extreme of vividly picturing what legal penalties were in store for their erstwhile allies if by any chance these retail friends had really been seeking what their association had officially gone after the November before, and had been working to secure during the entire preceding session of the Congress!

There resulted from these warnings, among which my letter to you had at least the merit of being consistent with my previous stand, as thorough a scaring as a trade body out for selfish and improper legislative ends has ever been given. I judge from published statements credited to some of these retailer-lobbyists that certain unnamed officials in Washington, who were called apparently into consultation by the group set up by the "victory" meeting of last August to gather in the fruits of victory, turned the scare into a panic.

This panic, and the appearance of the President's call for a revision of the antitrust laws, lead to a new strategy—the avowals of a complete retreat from the objectives officially undertaken at the meeting of last November, which I mention above.

The "retreat" was widely publicized at the convention of the association held in St. Louis, September 27 to 30, only a month after the Chicago "victory" meeting. At this convention it was officially announced, by practically the same individuals, that nothing was further from the association's objectives than what it had announced as its objectives the preceding November, the objectives, moreover, it had actually started out to put into practice but 30 days before at the Chicago "victory" meeting.

As a matter of fact, incredible as such an about face is, the plans set up at the end of August in Chicago were discarded at the end of September in St. Louis with many protestations to the high heavens that they were most abhorrent indeed to the high mission which in some mysterious manner had enveloped this group in the intervening 30 days.

The surface reports of this convention would have one believe this group had changed its objectives into everything laudable and praiseworthy, ranging from the most worthy fact-finding research undertakings to the most elevating of trade practices. Of course, a few glimpses of the scare itself, and the causes underlying it, crept into the proceedings. For example, one druggist wrote: "There is one thing we found out in St. Louis and that is this: 'It's better to go slow and look before you jump than to be getting somebody to go your bond.'"

But, by and large, the real causes for the apparent right about face from the official stand of the previous November, and the actual practice undertaken in August after the passage of the Miller-Tydings amendment had been secured, was pretty well hidden.

This all might better be passed by without further attention, and the alleged corpse of this price-fixing scheme left with those who so hastily manufactured it, were it not for these facts:

First, the right-about-face was obviously merely the result of a scare, and a scare coming just when the President had called the anti-trust laws, which include the Miller-Tydings amendment, up for revision, and after he had definitely stated that amendment weakened the anti-trust laws.

I am afraid the effectiveness of the scare is in no small part due to a fear that unless the objectives officially announced last November, and the practices put in motion last August before the revision of the antitrust laws was announced by the administration, were "shushed up" and rushed under the table, the revision of the anti-trust laws might well include changes that would "put the finger on" just such price-fixing objectives.

For one, I hope the revision does include such safeguards, and I do not myself think for a moment the perpetrators of this huge national price-fixing drive would have sought cover, after obtaining the legislation they went after, and setting out in August to "cash in" on it, were it not for the unexpected announcement of this anti-trust law revision.

In other words, I believe the "corpse" is synthetic from head to toe, and the "retreat" entirely strategic. These leaders are out to obtain at all hazards what their association officially made its objectives on November 10, 11, and 12, of last year, and which it undertook to put in practice on August 30, and 31, last, and they can not, dare not, lay down in cringing surrender just at the moment they have told their followers they have won.

They knew in November of last year that they could only obtain their objectives by trade pressure implemented by the Miller-Tydings amendment; they knew that during the entire last session of the Congress during which they jammed through the implementing legislation; they knew it when they agreed to the improper and unholy practices decided upon at the August meeting this year, and they still knew it when they announced their purely strategic disavowals but a month later in September. What they are afraid of is the coming revision of the antitrust laws—they know they have weakened those laws and they know the President knows they have, and they have simply decided to keep under cover until the revision is completed.

Second, the small dealers the country over who put up the money, telegrams, and letters which made possible last session's "putsch" for the realization of the objectives of November a year ago, have not yet awakened to the fact that their leaders have retreated to a storm cellar, even if only temporarily and as a matter of strategy. These small dealers went out after at least 50-percent profit on cost by law, and they put up their money generously—their leaders admit to a six-figure war chest even today.

These small merchants are not going to suffer what to them will appear to be a sale down the river without having something to say, once they learn what has happened. They may not learn the truth for some time—they by and large do not attend the association's conventions; they get their earliest information through publications controlled either directly by association officials or indirectly by members of the industry who advertise in them, but sooner or later they will have to know.

And then they will bring pressure to get the results they thought were going to be obtained—the objectives officially undertaken by the association leaders in November a year ago. And what they demand is likely to be undertaken. The fact that improper plans were forced through the August meeting proves this. It is my belief, as I have stated, that their leaders merely hope to keep up their sanctimonious attitude long enough to weather the announced revision of the antitrust laws. The "scare" speeches featured at the September convention may serve to cover up their real position for a time, but not for any long interval.

It is because in my opinion these two reasons in reality underlie the change of front among those who lead the pressure group lobby for the Miller-Tydings amendment, instead of any actual change of heart, that I am addressing this letter to you. I urge that you investigate continuously the activities of the State groups which have been set up to enforce price maintenance in an effort to bring to light joint action between them. The leader of the lobby which undertook to carry out the objectives of the National Association of Retail Druggists announced November a year ago has himself just admitted: "Some groups in certain parts of the country still persist in attempting to set up committees in an effort to dictate and designate resale prices; attempting to order and direct by whom and how contracts shall be prepared and distributed; and attempting to set a fee for such services payable by the manufacturer."

And he himself admits these activities are illegal, although, of course, he is careful not to admit that those practicing them are simply continuing the crusade for maintained profits which he and his associated leaders led, right up to the moment of the "victory" meeting in August, but deserted when the great "strategic retreat" was decided on in St. Louis in September. It must, indeed, be difficult for the State groups, on which he now "puts the finger," to understand why they should be "turned up" for simply carrying out the national association's official undertakings of November a year ago.

It is, of course, impossible to secure the sort of price maintenance these State groups desire unless action is directed nationally by the manufacturers', wholesalers', and retailers' associations. Even if manufacturers and wholesalers who attend the retailers' councils, and then proceed directly to the councils of their own trade, are the only connecting links, they are very effective links, indeed. That such a liaison exists, only the most naive would question.

Methods for obtaining the satisfactory price action among manufacturers which originate in one State will spread to other States. I hope that your staff will be conversant with these methods from their initiation.

For example, California, the State which has originated most of the price-fixing among dealers, has, I understand, developed a method of disguised boycotting by the old "white-list" racket which must be most effective.

The central organization—and California druggists have, I am told, for some time maintained a hired mechanism to aid price-maintenance enforcement—I understand fixes the prices with manufacturers and then circulates to stores, ostensibly for display in their windows, placards listing these manufacturers.

Could there be a more deadly use of the old-style "white list"? Would such a plan, extended nationally, fail to bludgeon manufacturers into line, totally regardless of the consumers' interests, when comparatively indirect-boycott methods forced one manufacturer, as I say, to "come across" with $25,000, once he had aroused these California dealers and they had apparently used the grapevine to inform their fellow tradesmen in other States that he was "on the spot"?

Incidentally evidence that California consumers are not taking unnoticed the licking which consumers always undergo as the result of such price tinkering comes from an interesting source. The vice president of one of the drug houses, supposedly in the forefront of price maintenance, and currently advertising to druggists prices, assuring them 38.9 percent profit on purchases of only a dozen, sends this postcard message from Los Angeles, Calif.: "Despite stock market disturbances, business is good on the coast, but consumers are beginning to shy at high prices."

The California druggists have so frequently cited misleading "investigations," and misleadingly quoted investigations of some value, to support their claim that price increases have not resulted from their "fair-trade" campaigns, that it is interesting to have confirmation of the real facts come from one of the manufacturers they have counted among their supporters.

I specifically ask that you have this newest California bulletin and window placard plan for price fixing studied, for it is obvious that, if effective, it will spread to other States. It is obvious that a boycott, disguised in one way or another, is the weapon to which dealers will eventually turn in their efforts to capitalize on the Miller-Tydings amendment, no matter how vociferously their Washington lobby leaders plead with them to keep under cover for strategic reasons until the revision of the antitrust laws blows over.

These retailers have threatened boycotts in the past, have actually used them in some cases, and it is not logical to expect that they will now forget them simply because their leaders suggest lying low until the antitrust law revision blows over.

Repeated references of a veiled sort to the subject during the St. Louis convention last September, at which the strategic retreat was announced, convince me that as a matter of fact boycotting very likely may have been actively discussed on the side as the weapon that might finally have to be used.

For example, this comment by a druggist, made after his return from the "strategic retreat convention", and printed in the association's official journal, certainly is susceptible to considerable between-the-lines interpolation: "Well, fellows, after all, that slogan that seemed to be in order up at St. Louis, 'Where do we go from here?' has stuck in my craw ever since I got back. We came, we went, and saw, but, after all, all this hullabaloo about fair trade has begun to bile down and the more you bile it the littler it gets. We all thought we had the world by the tail and a down-hill pull, but, after all, we have got a job ahead. * * * Just cut out this frettin' and stewin' and get our think tanks in the back of our heads moved up front and start using them, because, after all, what the manufacturer has to offer under fair-trade acts is his business, and if you don't like it, we will have to go back a few years and use the advice of Verle C. Smith, 'Do your own thinking.'"

What Verle C. Smith's "Do your own thinking" meant a few years back is exactly what it means in organized drug retailing grapevine vernacular today, and that meaning is simply, in plain English, application of the sort of boycott which leads the manufacturer I have mentioned, to not only see to it that druggists got more profits, but to "kick in" with $25,000 toward the price-maintenance lobby fund.

Mr. Smith and his followers simply want delivery of exactly what the National Association of Retail Druggists officially undertook to get them in November of last year—at least 50 percent on cost under maintained prices. They intend to resort to direct action if they do not get it and are not going to accept a "strategic retreat" gracefully, because they know it means maintained prices which allow the small man from 18 percent to 20 percent under the minimum prices fixed by the manufacturers of the fastest selling lines, while the largest chains get over 30 percent, which, incidentally, I am told, are exactly the minimum percentages at which one of the most widely sold lines has actually been stabilized under the Miller-Tydings amendment.

Mr. Smith and his followers cannot see in those percentages any profit assurances for the small dealer such as the association underwrote when it officially sponsored 50 percent on cost. They are right; but the point at issue in connection with the antitrust laws is whether they can get legally that 50 percent they are now finding the Miller-Tydings amendment is not going to get them.

If they can boycott "within the law" they may be able to get it; one of the products most heavily sold actually now nets them about 40 percent on the average, I am told, which, incidentally, means to the consumer a price "upping" of about 13 percent, probably, also on the average.

Certainly if they can get that far by exerting a little "thinking" on manufacturers, the consumer needs protection, and needs it quickly.

It is such highly organized small-unit-pressure activities, as harmful to consumers as any price-fixing understanding among a few large units, which are subject to criticism, and not legitimate objectives for banning predatory loss-leader selling or any other trade practices which are unfair to the small dealer. And it is these organized activities which will, in my opinion, challenge the Commission's watchfulness in order that consumers may be protected from boycotts and other forms of collusion obviously contrary to existing law.

I want to call one more incident indicative of this sinister type of group action to your attention. It is particularly sinister because it apparently involves an attempt actually to censor consumer channels of information.

The corner drug store is an important source of consumer contact for publications. Specialized wholesalers, and regular drug middlemen supplying this market, and obtaining a service payment for doing so, are either naturally as subject to group pressure from drug organizations as the manufacturer of nationally advertised drug items, or are, in the case of drug middlemen, openly interested in price maintenance as a method of increasing profit margins.

Allegations have come to my attention that in at least two States such wholesalers have actually been openly "requested" by officials of retail drug organizations to recall from circulation articles attempting to give consumer facts about the Miller-Tydings amendment and its background, but facts which evidently the organized retail druggists fear to have come to the knowledge of consumers. Some of these facts, strangely enough, have to do with the $25,000 "contribution" by a manufacturer to which I have referred above.

Since one of the claims made for enactment of the Miller-Tydings amendment is that consumers know all about it since State legislatures, "fresh from the people," have passed the underlying statutes, these alleged efforts to force withdrawals of consumer periodicals are most challenging. The truth is of course that consumers have been almost totally unaware of the enactment of the State laws underlying the Miller-Tydings amendment, which have been very deceptively labeled "fair trade" laws.

These alleged censorship efforts which have been called to my attention, and which I call to your attention officially as possible unfair trade practices involving the public interest and interstate commerce, certainly indicate both that the organized retail druggists do not really themselves believe consumers are informed on price-control legislation, and as well that they do not, moreover, intend to have facts, of which they do not approve, reach consumers if they can prevent it.

The most sinister aspect of these forced withdrawals, of course, is the implication of efforts to censor the consumer's sources of information by organized trade groups. An awakening is occurring in this country to the importance of increased knowledge about the problems of spending.

This awakening is most significant; it holds great possibilities for the country's welfare.

To have organized trade groups attempt in the face of it, even if futilely, a control of the freedom of the press in respect to consumer information—control of a type the Constitution denies to the Congress itself—would present a real challenge.

I will, if you care to so request supply you with the names of the organizations alleged to me to have been specifically involved in incidents of this nature and also the names of the periodical or drug wholesalers which have been mentioned to me.

The information which principally brought about this alleged coercion, I am told, was a photographic reproduction in a publication entitled "The National Consumer News," of a check dated October 1, 1935, and drawn on the Commercial National Bank & Trust Co. of New York City by the Pepsodent Co. of Chicago in favor of the National Association of Retail Druggists, and apparently cashed by that organization.

It is my understanding that the drawer of this check manufactures dentrifices and mouth washes sold through drug stores of the type dealt with by the wholesalers upon whom the coercion I am calling to your attention was alleged to me to have been exerted, and that the sort of boycott by drug stores to which I refer above was at one time practiced on this manufacturer to such an extent that his business in interstate commerce was seriously affected.

With the information I give it may be possible for the Commission to establish if in fact the reproduction of this check is connected in any way with the coercion alleged to have been exerted. If such a connection can be thus established between any previous experience of the drawer of this check with coercion affecting his distribution, and also exerted by retail druggists, and the reproduction of the check with the object of bringing the manufacturer's experience with such coercion to the attention of consumers, I would be glad, indeed, to have you so inform me.

I know I do not have to add that my persistence in placing before you facts coming to my attention which seem to me to possibly involve endeavors to control prices adversely to the inter-

ests of the consumer under cover of protestations of laudable trade-practice betterments for improving the protection of small merchants from unfair or predatory methods is based entirely on a belief that in the end it is the small man who will be most directly harmed by exploitation of the consumer through price-fixing coercions.

I have long stood and now stand for protecting the small merchant from unfair and predatory practices.

I go further and stand for protecting the small merchants' gross profits to even an extent sufficient to cover known minima wages and rental expenditures.

And going still beyond such protections and reaching far deeper than they reach, I stand for liberal expenditures for providing the small merchants with operative knowledge and buying facilities which will enable them to do business more effectively. I firmly believe the small merchant should have assistance as practical and as useful in a dollar and cents way as that made available to the farmers.

Given such assistance, the average American merchant can stand on his own feet and meet competition without asking for a prop in the shape of laws levying on consumers for his benefit.

The American merchant is amply able to take care of himself if given an even break, but a break in the shape of price controls that amounts to a levy on the consumer is neither fair to him nor the consumer.

The small merchant will only benefit in the end from a break which enables him to serve the consumer effectively; the small merchant can only ultimately suffer from a break which necessitated service to the consumer.

Therefore, in my opinion, the Commission can render both the small merchant and the consumer no service more constructive than that of checkmating those types of price activity which are still contrary to the antitrust laws. I believe the Commission has been most vigilant and energetic in the consumer's interests and I am daily encountering indications that consumers are noticing this watchfulness on their behalf. I know the Commission has also at heart the legitimate interests of small merchants. It seems to me that this field of price coercion offers opportunities to protect the fundamental interests of consumers and small merchants alike.

The President has formally requested the Commission to investigate causes underlying current increases in the cost of living.

May I be so bold as to suggest that the very practices to which I have referred here, and which I originally called to your attention in my letter of March 2, are directly involved in increased consumer prices?

My letter of March 2, as a matter of fact, requested in specific terms involving a specific industry, exactly what the President now requests for all fields, and it is my hope that in supplying the President with the information he requests you will, as a matter of course and without additional expense, obtain the information for which I have asked.

Yours very truly,

EMANUEL CELLER.

A Concrete Proposal—Stable Price Level—Public Works Without Interest

EXTENSION OF REMARKS

OF

HON. H. JERRY VOORHIS

OF CALIFORNIA

IN THE HOUSE OF REPRESENTATIVES

Thursday, November 25, 1937

Mr. VOORHIS. Mr. Speaker, here is the problem of the Seventy-fifth Congress: To reduce certain taxes on business seems desirable; but to deny several million unemployed people opportunity to earn a living is wrong and unjust. Moreover, at a time when business is declining, the Government should put more, not less, buying power into circulation. The best way to do this is by carrying on necessary public works. To reduce taxes and also balance the Budget, then, will inevitably cause great human suffering, an even sharper decline in business activity, fewer orders for goods, and more unemployment. Obviously that is no answer.

To reduce taxes on business and pile them on consumers will not improve the situation, but probably make it worse.

And yet we all want a balanced Budget and we do not want to increase the national debt if we can help it.

Above all, we are confronted by a money and credit monopoly which unquestionably can—whether it has or not we will not discuss—deliberately bring about deflation and depression.

GOVERNMENT SHOULD EXERCISE ITS CONSTITUTIONAL RIGHT TO USE ITS OWN CREDIT IN PUBLIC INTEREST

We need then a measure which will be financially sound and which will assure the people of employment and business of increased buying power without necessitating either increased taxes or increased debt. Is there such a measure?

I believe there is. And I believe it is exactly the kind of measure we need to start the process of reclaiming our sovereign right of government—the right to bring money and credit originally into existence. All we need to do is extend Government credit on exactly the same kind of security and in exactly the same manner as private banks have been doing for years. My suggestion is not new. A bill along the same lines was introduced some years ago by the gentleman from Illinois [Mr. KELLER].

Here it is. Extend United States Treasury credit on the security of noninterest-bearing bonds of States, counties, municipalities, and other local governmental subdivisions which are financially sound and responsible. Or to put it another way, tell the governmental subdivisions of America that the Treasury will buy their noninterest-bearing bonds with Treasury credit providing the money is to be spent for necessary public works. It should, I believe, be stipulated that at least a certain percentage of the money would be spent for housing. Such bonds should be repayable in 20 or at the most 30 equal annual installments. Public works, houses, school buildings—a thousand other needed things could be constructed for half what it costs to do it now. For without figuring compound interest at all, suppose bonds bearing interest are sold by a city up to say a total of $1,000,000. Five percent of $1,000,000 is $50,000. Twenty times $50,000 is $1,000,000, which added to $1,000,000 of principal makes exactly $2,000,000, which is the cost of the same amount of public works, the same amount of wages, the same amount of production under the present system, which under the plan I have suggested could be had for $1,000,000. Such is the extent of our tribute to finance.

At present at least nine-tenths of all our money consists of bank deposits created by the banks through the simple process of loaning several times the amount of money they possess. The loans are made on the hope and supposition that they will be repaid in time to meet depositors' demands.

Our Government has $12,000,000,000 of gold. It has taxing power to reach all the wealth of America. These are our reserves. To say they are inadequate is clearly ridiculous. To extend credit on perfectly good security, to make loans which will be repaid far more surely than any bank loans, is all this proposal amounts to.

Why not? About the only argument against it is that if America once frees herself from the bondage of her people to finance monopoly she will never go back again. Concretely what this means is that as these loans are repaid a vast fund will be created so that similar loans can be made in the future.

We can rebuild America, reemploy America, revive American business by this simple expedient.

There are other things that also need to be done in order to give our Nation a really sound and stable monetary system. But a great deal of progress toward a stable price level could be made by the plan advanced above. For if too many local non-interest-bearing bonds were presented to the Treasury and a boom threatened, then a rate of interest of 1 or 2 percent could be required. This would mean income to the Federal Government. It would check the flow of credit. If then additional expansion were later needed, we could go back to the noninterest plan.

We need courage, imagination, and hard thinking. And if we are at present prevented from doing new right things, at least we can stop doing old wrong things. That is all my proposal amounts to.

OUR STRANGE SUPERSTITION

In conclusion, Mr. Speaker, may I quote from Mr. Christopher Hollis' excellent book, The Breakdown of Money, one

paragraph which seems to me especially applicable to our present problem:

Indeed, the historian has to record that in almost every age there was some superstition or other of utter unreason which strangely occupied the minds of men, otherwise of activity and vigor. He has to confess that he cannot explain how it was that men once believed in the mystical significance of numbers or in the claims of astrology. We are sometimes ready to congratulate ourselves that our age has outgrown all superstitions. But the historian of the future will, I fancy, reckon in the same class as number worship and astrology and the study of the gizzards of birds the strange superstition that whenever money is invented a percentage must be paid forever afterward as a propriation to a banker. It is on that superstition that the whole empire of Mammon is built.

The Necessity of an Adequate Navy for National Defense

EXTENSION OF REMARKS

OF

HON. JOHN KEE

OF WEST VIRGINIA

IN THE HOUSE OF REPRESENTATIVES

Monday, November 29 (legislative day of Thursday, November 25), 1937

RADIO ADDRESS BY HON. JOHN KEE, OF WEST VIRGINIA, ON OCTOBER 26, 1937

Mr. KEE. Mr. Speaker, pursuant to leave given to me to extend my remarks in the RECORD, I am inserting an address delivered by myself on October 26, 1937. This address was delivered over the radio through the facilities of station WHIS at Bluefield, W. Va., the occasion being a celebration of Navy Day, scheduled to take place upon the day following the address:

My friends of the radio audience, tomorrow, October 27, we observe our fifteenth annual Navy Day. October 27 was selected as Navy Day because it is the anniversary of the birth of President Theodore Roosevelt, who all of his life advocated the establishment of a sound Navy policy for the United States of America. President Roosevelt believed in an adequate Navy for the defense of this country and as a means for the preservation of peace. As Assistant Secretary of the Navy and later as President, he gave of his time, his ability, and his energy to strengthen this arm of the national defense.

The history of the American Navy is rich in romance and of tradition. It is an unbroken and unmarred record of unfaltering courage, distinguished service, and honorable achievement. This record covers a period of 162 years. It carries us down from that day in June 1775, when a party of Maine woodsmen with an old lumber sloop, and armed for the most part with pitchforks and axes, sailed out into the Atlantic and captured an armed British schooner off the Maine coast, and brings us down to those months in recent years when, under convoy of the Navy, over 2,000,000 American soldiers were transported across the submarine-infested Atlantic Ocean without the loss of a single life. And, as I speak to you tonight, the American Navy is standing watch and ward over the lives of American citizens—men, women, and children—who, under adverse fortune, were caught in the holocaust of devastation and death now being visited upon the Chinese people by the unwarranted acts of another nation, acts of such bloodthirsty cruelty and brutality as have no parallel in the history of mankind.

The actual beginning of the American Navy was in the fall of 1775, when, after the British had burned the town of Falmouth (now Portland), Maine, leaving the inhabitants shelterless at the beginning of a bleak New England winter, George Washington wrote to Congress reporting the burning, and Congress acted promptly. The letter from Washington was read in Congress on November 1, 1775, and on the following day that body voted $100,000 for naval armament and appointed a committee to buy ships. This committee functioned, and by the end of January 1776 the American Navy had eight vessels, which cost an aggregate of $134,333. The total armament of all the eight ships constituting the first fleet of our Navy was about 110 guns, and the fleet was manned by men without naval training or discipline.

To oppose this force of American vessels the British at that time had in American waters along the coast from Maine to Florida a fleet of 78 men-of-war, mounting 2,078 guns.

It is strange for us to learn from history that even with the conditions just mentioned confronting them we find that at that time a majority of the people of this country were opposed to the creation of a navy. They thought, as many assume to think today, that naval power was but a tool of monarchy and that if once established it would tend to the centralization of great power in the hands of a few and thence lead to the ultimate destruction of liberty, freedom, and independence of action. The people who entertained these views were the pacifists of that time, and, like those who entertain the same view today, they failed to appreciate the absolute necessity of having sufficient naval power to protect this country from an enemy invasion and destruction by the same instrumentality to which they were offering objection.

Most fortunate indeed was it that wiser counsel prevailed and the nucleus of an American Navy was assembled. From that time the exploits of the American Navy wrote pages in history which will never be dimmed so long as time may endure. What American heart does not thrill with pride when we see through the mists of the past the heroic figure of John Paul Jones standing amid the flames of his burning and sinking ship, the *Bonhomme Richard*, dauntless and unafraid, flinging across to his enemy the defiant challenge, "I have not yet begun to fight!" What American is not stirred to the depths when from the recorded pages there comes to him the story of Lake Champlain, where on October 11, 1776, a full squadron of American ships built and launched by inexperienced woodsmen, manned by a motley crew of Americans, most of whom had never been on shipboard before, and commanded not by a naval but by a military commander, engaged and fought to a finish a greater squadron of British ships, larger in tonnage, more thoroughly equipped, manned by experienced seamen, and in command of one of Britain's most distinguished naval officers?

This was the struggle designated by the historian Mahan as "the strife of pigmies for the prize of a continent," and he added this historic statement: "Never had any force, big or small, lived to better purpose or died more gloriously."

It would be impossible, during the brief time allotted to us, to carry our audience down through the years with the history of the glorious achievements of Americans at sea, but where could we find greater inspiration than in the exploits of the *Constitution*, the *President*, the *Chesapeake*, the *Constellation*, and other famous ships, not only in Mediterranean waters against the pirates but upon the Atlantic during the second war for independence, and of the gallantry and bravery of Dale, Decatur, Bainbridge, Preble, and other brilliant and gallant American commanders. Who does not thrill at the story of the *Intrepid* under Captain Somers in the harbor of Tripoli and who does not drop a tear to the memory of Lawrence who, wounded to the death, breathed as his last words on the deck of the *Chesapeake* the deathless command, "Don't give up the ship." As we turn the pages, who is it who cannot envision the joy of the American people in those days when Commodore Perry sent from the lakes of the north his famous message, "We have met the enemy and they are ours." And as the years pass, is there any among us who have not sailed with Captain Sims, the Confederate but American, upon the *Alabama* across the seven seas, or who have not in imagination been with Farragut as he forced his way up the Mississippi or stood with Dewey on the decks of the *Olympia* when with the quiet command "You may fire when you are ready, Gridley," he inaugurated a battle which swept from the high seas one-half of the proud Navy of Spain?

Who is it today who can question the value to the American people, or the absolute necessity to us, of a strong naval force. Our faith is in the integrity of our Constitution. Our faith is in the inviolability of our soil. Our faith is in the liberty and security of our citizens. Our faith is in the permanence of our institutions; and the American Navy for 160 years has been, and is today, the protector and defender of our faith.

In these modern times, more than ever, do we need this defense. We do not need a strong naval service for aggression, and history has shown that our Navy has never been aggressive; but now, as never before we do need to surround our country with mobile forts of steel to protect us from the aggression of others. The inventive genius of man has succeeded in wiping out distances even as we erase a sentence from a blackboard. Where in other days it required weeks and long months for other nations to establish communication with our shores, today it is but a matter of days and hours. The waters of the great Atlantic and the broad sweep of the Pacific no longer serve as protection. Without a naval force to oppose them, the battleships, cruisers, destroyers, and airplane carriers of the nations of Europe could within a few days reach our Atlantic shores and destroy every city upon or near the thousands of miles of our practically unprotected coast, to say nothing of those within the interior. The same, in a lesser degree, is true of our coast on the Pacific. The same is true in a greater degree of our island possessions and of the Panama Canal Zone, in which is our greatest facility for ocean communication from East to West. What have we today standing between us and this destruction? Nothing save and except the American Navy. The pacifists may argue, as has been often argued, that "upon an invasion of our shores 10,000,000 of the flower of American citizenship would spring to our defense." That might be true, but those 10,000,000 would, under present conditions, be untrained, inexperienced, untried, unqualified defenders, practically none of whom would be equipped with the modern means of defense. A large standing army has never been popular and never will be in this land of ours. We are not a military people. We do not believe in a military oligarchy. We do not want to set up within the confines of our country a militaristic government such as obtains in the Old World, and we never will; but our very life and liberty,

the security of our people, the safety of our property and the permanence of our government require that we have and maintain a reasonable army, and a navy capable of defending us from an assault by any other navy on earth.

We do not want war. We hate and we despise war. We have learned this lesson in the school of experience, and if I may be pardoned a personal reference, I wish to here declare that, so long as I am a Representative in the Congress of the United States, I shall never vote to send an American soldier away from his homeland to engage in war upon another people. We ask only peace and the right to live in quietude and happiness in our own homes, the right to educate our children for something else beside the profession of war, the right to remain free from entanglement in the affairs of others. All these rights can only be guaranteed by walking the pathways of peace, and in that pathway we should solemnly resolve to walk.

As I speak to you tonight, however, we cannot close our eyes to the fact that we are living in a world of chaos. Even as Patrick Henry said in the early days of the Revolution, we cry "Peace! peace! when there is no peace!" War flames across the hills and valleys of Spain. War still lights with its conflagrations the skies of Ethiopia and northern Africa. War is raining pestilence, misery, starvation, and death upon the helpless women and children of China. War is knocking with its mailed fists at the doors of practically every country of the Old World across the seas. At any time we may hear the sound of the footsteps of Mars approaching the gates of our own peaceful country. To drive this hideous specter from our doors it is a necessity that we guard well every portal from Maine to Florida and from Oregon to the Mexican border. This successful guarding can only be accomplished by means of our naval forces, by means of ships which fly at their masthead the American flag, which has never meant aggression, but has always been the emblem of national defense.

Since the founding of this Government we have been at war many times, yet we have never entered a war for which we were prepared. We were unprepared for our early conflicts with the pirates of the Mediterranean. We were hopelessly outclassed when we entered into a contest with France, soon after the establishment of our independence. We were without preparation for the War of 1812, when we were forced to the use of warships constructed from timber cut green from the forest. We entered the Mexican War without preparation. We were unprepared for our War with Spain. The great World War found us in almost a hopeless condition of unreadiness. In every instance this lack of preparation was the cause of incalculable loss to us, not only in property but in the needless sacrifice of the lives of countless thousands of brave but improperly and insufficiently provisioned, equipped, and trained men. It is my honest opinion that if this Nation had been prepared for war in 1917—had we then had a Navy equal to that of Great Britain—Germany would not have adopted the policy of unrestricted submarine warfare and we would have avoided the world-wide conflict.

An army cannot be trained and equipped for war in a day, a navy cannot be created by the wave of a magic wand. Months and years are required for the fabrication of the vast war machines of modern times. Months and years are necessary to the training of men in the operation of these instrumentalities. So long as we are without this equipment and without these trained men, just that long are we helpless to defend ourselves. The time to prepare for a possible conflict is now—now while we are at peace—not after an attack is made upon us. It will then be too late. To defend our homes let us guard the gateways leading to our homes. It has been appropriately said, "A rich man, when his castle is well guarded, sleepeth in peace."

Pass Wage-Hour Bill Because It Is Right

EXTENSION OF REMARKS

OF

HON. H. JERRY VOORHIS

OF CALIFORNIA

IN THE HOUSE OF REPRESENTATIVES

Thursday, November 25, 1937

Mr. VOORHIS. Mr. Speaker, the wage and hour bill ought to be passed because it is right, because it is fair, and because it is just. That is the only reason, and the bill will have to depend for support on those who are moved by reasons like that.

The reason for passage of this bill is to protect a group of people who cannot demand protection, who are without any form of union organization, and whose political influence is negligible.

It is not a bill for organized labor. It is an antisweating measure. And plenty of good businessmen are for it on that ground.

FORTY CENTS AN HOUR MEANS $832 A YEAR AT MOST

Forty cents an hour means $16 a week and $832 a year if a person works every single week in the year! Does any Member of the House think we can have a democracy in this country while millions of the toilers of the land are deliberately denied even that standard of living? Is anyone willing to admit that our much-vaunted American industry will go broke if it pays that scale of wages to its poorest paid workers?

Many American industries have been benefited through the years by the fact that cutthroat competition by means of wage cutting was eliminated from the industry through the power of union organization.

This bill will help to do that same thing for all industry which affects interstate commerce.

The first proper charge on industry should be the payment of a living wage. This bill will hardly require even that in all probability. What it will do is to say in effect: "There is a point in wages below which no American wage earners shall be asked to work; and there is a certain number of hours beyond which, except in extraordinary circumstances, they shall not be asked to work."

I believe Congress should write the minimum wage and the maximum hours into the bill itself, instead of leaving the matter to be determined by anyone else.

If this measure ever gets through the House, it will be because at least 218 Members of this body, led by the majority leader, the Honorable SAM RAYBURN, of Texas, had sufficient courage to do their simple duty by a group of Americans who could look to no one but their Government for protection and a better life.

America's Aloofness

EXTENSION OF REMARKS

OF

HON. ALBEN W. BARKLEY

OF KENTUCKY

IN THE SENATE OF THE UNITED STATES

Tuesday, November 30 (legislative day of Tuesday, November 16), 1937

EDITORIAL FROM NEW YORK TIMES

Mr. BARKLEY. Mr. President, I ask unanimous consent to have printed in the RECORD an editorial published in today's New York Times entitled "America's Aloofness."

There being no objection, the editorial was ordered to be printed in the RECORD, as follows:

[From the New York Times, Tuesday, November 30, 1937]

AMERICA'S ALOOFNESS

The United States has lost its leadership in world affairs and to that fact largely can be attributed the impotence of the Nine-Power Treaty Conference in Brussels. The reason for this loss of influence is plain: treaty-breaking Governments and dictators have become convinced that for no cause short of actual invasion will the United States initiate or join in any effective movement to assure world peace.

For this conviction on the part of these treaty-breakers the "isolationists" and "pacifists" in Congress and their vociferous supporters in the country are chiefly responsible. These groups include persons who believe that we can stay out of any world conflict. They attribute our entrance into the last international war to British propaganda and the schemes of bankers to enrich themselves; and they oppose any strong peace measures by this Government, even though to abstain from such might mean the loss of freedom to those who regard it as highly as they themselves, and an impairment of liberty to men and women in this very hemisphere.

It is the assertion of such groups and their Congressional representatives that, because of the gifts of nature and geography, the United States can retain its institutions and live its full life alone in a world where democracy does not elsewhere exist, even though Great Britain and France were shackled by despotisms which turn human beings into machines for conquest and consign liberty to the fallacies of the past.

The power of these groups and their spokesmen has been in the ascendancy, as acts and events plainly indicate. In recent years they have seized upon every occasion when the American Government was seeking to express the scruples of conscience against treaty-breaking and aggression, to proclaim that, in no circumstances, would this people do anything effective to restore moral standards among the nations. Organizing, writing pamphlets and using the Congressional Record as their gazette, they gave notice as early as when Japan seized Manchukuo that the fixed future policy of the United States would be to keep out of war abroad, and that it would take no steps to prevent it, however clear the threat to our own institutions.

II

The attitude took form in the so-called Neutrality Act of 1936, with its "declaration of a state of war" and its "cash-and-carry" provisions. By the first named, the President was instructed by Congress, upon discovery of the existence of a state of war abroad, to withhold war material from all concerned, regardless of whether an invaded nation, fighting for its own as in the case of Ethiopia, was left at the mercy of a most ruthless aggressor. By the second named, American vessels were virtually swept from the seas, and only those warring nations which have navies and trade fleets were given access to our markets.

Attempts, in the name of international decency, to distinguish between honest and dishonest governments and to permit aid to nations clearly acting in self-defense against banditry, were beaten down in Congress. The world was put on notice that the United States was out to save its own skin from immediate dangers; and the dictators were informed that the American group controlling policy was prepared to see the world remade on fascist lines without interference and apparently without understanding that this would mean anything dangerous to us at all.

When the President, recently voicing this people's indignation against the invasion of China by Japan and horror at the butchery at Shanghai, recalled that there still were "quarantines" against Governments which did these things, a wholesome fear arose in certain capitals that the Neutrality Act might not represent enduring policy for the United States. And when next day the State Department named Japan as aggressor, the fear spread. But a little inquiry sufficed to prove that the pacifist and isolationist groups would not thus be led. Their Congressional representatives denounced the expressions as violations of the spirit of the Neutrality Act, which in truth they were, and, as soon as Congress met, the press cables carried abroad proposals of war referenda and other evidences that the group which framed the act is unchanged in its attitude. The Japanese Ambassador to Washington did his duty, and did it accurately and well, when he informed his colleague at Brussels that pacifism was still the American mood. The circulation of this report in the conference capital both tempered the messages to Tokyo and stiffened the rejections therefrom and in its atmosphere the Brussels conference went to its inevitable, inept doom.

Meanwhile, on the pretext that a world alliance against communism is the first essential to peace, Japan, Germany and Italy have signed a treaty. Outwardly it pledges these Governments to stand with force against the encroachment of Soviet teachings and the Soviet form of government. But in some European chancelleries and in Washington the pact is interpreted as a pledge, necessarily not stated in the treaty, that each of these three nations will stand by the two others, defensively and offensively, until each has gained its territorial and other objectives. To illustrate: If Italy further threatens in the Mediterranean and Great Britain steps in to check, Japan will proceed against Hong Kong and Singapore. If Germany thrusts southeastward in Europe and Great Britain and France move to check, Italy will extend her Mediterranean spheres and Japan will strike at French and British possessions in the Orient.

The ability of the three fascist States to carry out the arrangement outlined above is, of course, open to the most serious doubts. Germany's Baltic coast is bare to the attack of the British fleet, and experts are far from convinced that Mussolini could have his way in the Mediterranean, even with Britain greatly preoccupied in Northern European waters. The fact, however, that such a construction by responsible statesmen is placed upon the treaty, which was heretofore largely regarded as a mutual envisioning of bugaboos, now places the alliance where the democracies of the two hemispheres must consider it in stating their policies. And nothing could more effectively give expression to realization of the danger implicit in it than a tangible expression of the determination of this country to stand by the other democracies should the need arise.

III

This is not a preachment for war measures. The people of the United States are set against military expeditions, and rightly so. But there are effective peace measures, the most recent illustration being the decision of the British and American Governments to negotiate a trade treaty. This should be supplemented by every possible kind of private and public cooperation between Britons and Americans and others who speak, if not the same language, at least the same spiritual tongue. Understandings on trade, money and credit will serve as certain weapons against treaty-breakers.

Our statesmen and leaders of public thought could aid peace mightily if, losing fear of the blind peace groups and gaining confidence that plain common sense and self-interest can be trusted, they engaged in public exchanges to put the enemies of peace on notice that the great democracies are aware of what is planned and will stand together against it. The sure shadow of economic starvation on spendthrift Governments which cannot wage war unless we supply them, and deny supplies to their victims, can be made sufficiently effective as a deterrent without resort to the substance of sanctions or war.

Should such cooperations be publicly and steadily revealed, and such exchanges of thought take place, the New York Times believes the American people will awake to the facts which menace this nation; and the world will learn that events are conceivable, that circumstances can arise, outside this hemisphere, which will instantly range American public opinion behind an effective peace policy and make junk overnight of the so-called Neutrality Act. In the face of such exchanges of thought the policy of democratic nations will be stiffened and grooved; and treaty-breakers and dictators will take prudent counsel among themselves.

In such a manner can this nation restore a will for peace in the world and re-establish its lost leadership in international affairs. By such means the ravishers of small or weak neighbors and the enemies of democracy will discover that the United States has not become so timorous and so stupid as to abandon its responsibilities and imperil its greatness and its freedom. It will be wiser to put them on notice at once.

Tax Problems

EXTENSION OF REMARKS

OF

HON. JAMES F. BYRNES

OF SOUTH CAROLINA

IN THE SENATE OF THE UNITED STATES

Tuesday, November 30 (legislative day of Tuesday, November 16), 1937

RADIO ADDRESS BY HON. PAT HARRISON, OF MISSISSIPPI, UNDER THE AUSPICES OF THE NATIONAL RADIO FORUM, NOVEMBER 29, 1937

Mr. BYRNES. Mr. President, I ask unanimous consent to have printed in the RECORD an address delivered by the senior Senator from Mississippi [Mr. HARRISON] last evening over the National Broadcasting Co.'s Nation-wide hook-up, the subject being Our Tax Problems.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

Taxes are a necessary function of government. Without taxes government cannot exist. From the Federal Government's standpoint, taxes may be placed in three principal categories: First, those based on ability to pay, such as income, estate, and gift taxes; second, those based upon the principle of benefits received from the Government, such as social-security taxes; and third, luxury taxes, such as those on liquor and tobacco. From the first group the Government receives about 50 percent of its revenue; from the second group about 10 percent, and from the third about 25 percent. The remaining comes from miscellaneous taxes.

The amount of revenue received by the Government is dependent largely upon the principle of ability to pay. The amount received from this source depends upon two things, the rate, and the base upon which that rate applies. For instance, on income taxes, if the net income decreases substantially, even very excessive rates avail nothing in bringing in additional revenue. The same applies to estate taxes. If the value of stocks, bonds, and other property declines 50 percent in value, no more revenue is secured even by a very excessive rate. In other words, tax rates may be fixed at such an excessive point as to diminish the revenue of the Government instead of increasing it.

At the present time, I believe we have at least two so-called ability-to-pay taxes which have reached a point of diminishing rather than increasing the revenue. The taxes to which I refer are the undistributed-profits tax and the tax on capital gains. Not only do I believe that these taxes have an adverse effect so far as revenue is concerned, but I believe they have retarded industrial progress and contributed to the unemployment situation.

In recent years the Federal Government has expended large sums to aid employment. These enormous expenditures, to meet the emergency of a depressed economic condition throughout the country have made it necessary not only to retain existing taxes, but to increase and add new taxes. While the policies adopted by the Government for relief to the unemployed have ameliorated human suffering and brought relief to millions, the problem is still with us, and if the unemployment problem is to be solved, and solved soundly and permanently, it must be through the wholehearted cooperation of private business. I believe, therefore,

that an incentive should be given to private business to take up as much as possible of the slack of employment. We cannot give this incentive by excessive or punitive taxes.

If such a tax is imposed upon an industry as to make it impossible for it to pay its debts or to expand its business serious consequences result. Business expansion will not only bring about increased employment in the construction of added plant facilities, but it will also bring about substantial and continuous employment in the operation of such added plant facilities. As new people are employed in new industries, to that extent persons are taken from the relief rolls and necessary governmental expenditures to aid unemployment thereby lessened. And as private industry prospers, more revenue comes in to the Government and less money goes out in relief. If private enterprise can thus take over to a considerable extent the problem of unemployment, the time will soon arrive when the revenues of the Government will equal its expenditures.

If the cooperation of private business is to be obtained to the fullest degree, then the Government must give encouragement to private business. New industry cannot be created and old industries cannot continue to be operated without adequate and sufficient capital. Too rigid or unreasonable regulation of business, or too burdensome or punitive taxes discourage, shackle, and often destroy business.

Every good citizen will appreciate that adequate taxes must be provided for the efficient administration of government. Only in exceptional cases should the purpose be of a social or punitive nature. I have no doubt that the country today is suffering from fear and uncertainty, occasioned, may I say, to some extent by certain provisions of our tax laws. Of course many unconscionable methods have been created by the taxpayer to avoid or evade taxes, and it would seem that as taxes are broadened or increased, the number of devices and methods and tricks employed increase proportionately. However, I have no doubt that the vast majority of our taxpayers are fair to the Government, want to pay every cent they owe to the Government, and do not resort to such practices.

As it is the duty of the taxpayer to deal fairly with his Government, it is likewise the duty of a public servant to be fair toward the taxpayer. If those who formulate a government policy, either through legislative enactment or administration, have made a mistake which works injustices to the taxpayer or injuriously affects government receipts, then the mistake should be acknowledged and corrected. However high and laudable may be the purposes of certain policies, and however attractive they may appear theoretically, sometimes, as a practical matter, the injurious effects are greater than the benefits sought.

When, in 1936, the Congress enacted the so-called undistributed-profits tax, I was one of those who believed that the effect would be to put a stop to the unfair practice of certain corporations who accumulated their earnings in order to prevent the payment of surtaxes by their stockholders, and who also penalized their small stockholders by retaining from them dividends which should have been fairly distributed to them. I did not then believe, nor do I now believe, that large corporations should be allowed to build up unreasonable and unnecessary reserves. I recognize, as everyone who has studied the question must recognize, that it is sound business to retain from current profits sufficient reserves, either to meet current or future obligations or for improvements or necessary business expansion. And so, when the law was suggested and enacted, it was based upon that high purpose.

Experience has shown, and to me it has been shown conclusively, that while the law corrected some improper practices of a few corporations, it has worked tremendous hardships upon many others. In other words, for each corporation which has been justly penalized by this tax there are probably a hundred which have been unjustly penalized, because, for legal or moral reasons, they could not distribute their earnings in dividends. The result has added confusion to the economic life of the country, and to many of our fine American citizens it has been most disheartening and discouraging.

It is a harsh and unwise policy for the Government to compel a corporation that may be giving employment to hundreds or thousands of men and women to declare its earnings in the form of dividends to its stockholders when it needs such earnings to perpetuate the employment of those people. If the corporation has sufficient reserves to meet these necessities, then well and good; but when the corporation is without reserves or has little reserves, and there are thousands of them, and we require the profits made to carry a punitive tax when used to pay its legitimate obligations or to improve or enlarge its plant, then the policy is wrong and must be corrected. If the present system is continued, large corporations with tremendous reserves can continue, but less favored and weaker corporations without the reserves may be forced out of business. In such cases the very situation respecting employment that we are trying to relieve will be aggravated. Every time a going concern is forced to suspend operations it adds to the unemployed roll and threatens to compel the Government to increase emergency appropriations to aid the unemployed.

And so I say to you, as chairman of the Senate Finance Committee, and I am quite sure that I speak the sentiments of the great majority of the Members of Congress, that this undistributed-profits tax must be substantially modified. It is my hope and belief that in any event the law will be modified so as to permit a corporation, if it desires, to pay from its annual earnings, without penalty, amounts for debt retirement and for business expansion.

The subcommittee of the Ways and Means Committee of the House of Representatives has already announced a tentative plan which will substantially modify the severity of the present undistributed-profits tax. The plan considered, and which in all probability will be reported by the subcommittee to the full membership of the Ways and Means Committee of the House, exempts all corporations with net incomes of less than $25,000 from the undistributed-profits tax. This means, in numbers, that 88 percent of all corporations, under such a plan, would be exempt from the undistributed-profits tax. On the remaining corporations, or 12 percent of the whole number, it is proposed that if they retain all their earnings, a maximum total tax rate of 20 percent will be imposed. If a corporation pays out 50 percent of its net income in dividends, only an effective tax rate of 18 percent will be imposed. If the corporation, on the other hand, pays out all of its net income in dividends, its effective total rate of tax will be reduced through a credit to a maximum of 16 percent. In this connection it must be recalled that the rate on this group of the larger corporations under existing law is much higher when any substantial amount of earnings is retained. For example, a corporation with a net income of $1,000,000 which retains 50 percent of its net income pays an effective tax rate of about 23 percent, and if it retains all of its earnings it pays a rate of about 32 percent. I am sure that even if we went no further than the subcommittee's tentative draft, and those percentages are retained, all corporations, both in the larger and smaller classes, will find great relief.

When the tax committees of Congress were holding hearings in connection with the undistributed-profits tax in 1936, many of the representatives of corporations and trade associations recommended a very substantial increase in the normal corporate rate and a more preferable means of raising money than through an undistributed-profits tax. One representative of a great business association suggested a 22½-percent flat rate.

There is another provision of the present tax law that should and must be changed. I refer to the capital-gains tax. In my opinion no factor has been more influential in discouraging trade in stocks, securities, or property holdings than our high surtax structure and very stringent tax on capital gains. It is apparent that those in the higher-income brackets or middle-income brackets will not part with their holdings when they know that in some instances they must share with the State and Federal Government a tax as high as 90 percent. So, they choose to retain their holdings indefinitely, because they do not feel they can afford such an impairment of capital as would come about by the payment of the capital-gains tax. It did not then and does not now appear to me to be logical that an individual can trade an apartment house for another apartment house; that he can shift his money on deposit from one bank to another bank, and can trade one horse for another horse without the payment of a capital-gains tax; but when the same individual trades a horse for a buggy or takes his money and buys a United States Steel bond and trades that bond for a bond in some other company he must pay the tax. In other words, in some instances a man pays a heavy tax on mere change of his investment, and in other instances he does not. No person can be criticized for refusing to sell a security, stock, or piece of property when he knows that if a large profit has been realized the Government will give the individual one slice of the profit pie, and retain nine slices for itself.

Our tax policy with respect to capital gains, without question, has slowed up trade. Such a policy has filled safety deposit boxes with property in securities and stocks and cash, freezing credits and preventing the flow of capital into new enterprises. If securities or property are permitted to be turned over rapidly, there will be more trade and in my opinion a freer flow of ready money into new industry.

No part of our tax structure needs more immediate and rational modification than the capital gains and the undistributed-profits provisions—that the inequities occasioned by the latter may be eliminated and the barriers erected by the former against the free flow of credit and capital may be removed.

These two changes will encourage business, increase Government receipts, and offer greater hope to the unemployed.

More specifically speaking, I would say that the capital-gains tax should be taken out of the ordinary income and surtax sections of the present law and placed in a classification to itself; and the tax on capital gains should be at such reasonable figures as not to prevent or hamper ordinary business transactions. I have no doubt that this will be done.

The subcommittee of the House Ways and Means Committee has already agreed to a tentative plan in the modification of the capital gains tax, so that the rate will be graduated downward after the property has been held over 1 year. After the property has been held over 5 years, the maximum rate will be 16 percent. I hope, if possible, keeping in mind, as we must, the condition of the Treasury, to see that rate made lower and greater relief given as to time requirements for holding property.

Other changes are needed in our tax structure, but, in my opinion, these two are the most pressing and important.

In working out these tax plans and in the enactment of the law please bear in mind that under the Constitution revenue legislation must originate in the House of Representatives, and the

Senate is powerless to take any action upon these tax measures until they have first been acted on in the House.

There has been a fine degree of cooperation upon the part of the Treasury, the members of the Ways and Means Committee of the House, and the membership of the Senate; but study, research, and extreme care must be employed in the constructive work of tax legislation. Since November 4 a subcommittee of the Ways and Means Committee has been meeting twice daily in the speedy but careful consideration of this problem. We are all working toward one goal, and we are trying to do the job just as expeditiously as the magnitude of the task will permit. There is no doubt that the Congress is alive to the need for prompt attention to this important matter, but the country must not expect us to be swept off our feet and complete this task in a shoddy fashion or overnight.

In conclusion, permit me to say that the people should not be encouraged to expect a retroactive feature to these modifications. The year 1937 has almost passed into history. Many of the corporations have already distributed in dividends the profits of the current year. As a practical matter, most of the others must declare out their dividends by December 15 if they are to be sure to obtain the benefit of a dividend credit in the computation of their 1937 taxes. It would be hardly fair to penalize corporations that have already made their distributions in the light of existing law and favor others which might happen to be able to take advantage of a retroactive measure. Such modifictions must, in my opinion, date from the first day of the next calendar year and cover the future and not the past.

Speaking to you tonight with all the emphasis I can command, may I say that the country may be assured that there will be no deviation of plans and no let-up of purpose to accomplish the ends we are seeking; and I pledge you that what I can do, either as chairman of the Finance Committee or as a Member of the Senate, to effectuate these modifications in the undistributed-profits tax and the capital-gains tax I will do, and that as expeditiously as orderly and rational consideration will permit.

Foreign Trade Policy

EXTENSION OF REMARKS

OF

HON. PAT HARRISON

OF MISSISSIPPI

IN THE SENATE OF THE UNITED STATES

Tuesday, November 30 (legislative day of Tuesday, November 16), 1937

ARTICLE PUBLISHED IN THE POLITICAL QUARTERLY, LONDON, ENGLAND, OCTOBER–DECEMBER ISSUE, 1937

Mr. HARRISON. Mr. President, I ask unanimous consent to have printed in the RECORD an article published in the Political Quarterly, of London, England, October–December issue, 1937, on the foreign trade policy of the United States by Mr. Oscar B. Ryder, a member of the Tariff Commission.

There being no objection, the article was ordered to be printed in the RECORD, as follows:

FOREIGN TRADE POLICY OF THE UNITED STATES

(By Oscar B. Ryder, member, Tariff Commission)

The years which have elapsed since 1929 have brought significant developments in the foreign trade policies of the United States, till the end of 1933 principally in the direction of increases, but since then principally in the direction of decreases in trade restrictions.

The first result of the depression was an extension of the protectionist system. Although in 1922, after a decade of lower tariff policy, the tariff had been restored to a high level, it was further increased in June 1930. The 1930 increase, although initiated early in 1929, was nevertheless largely influenced by the depression and by conditions, particularly in certain branches of agriculture, which foreshadowed it. Since 1930 there has been no legislation imposing new or higher tariff duties as such—that is, as amendments to the tariff act. What, however, are in effect additional duties have been imposed in successive internal revenue acts, under the guise of excise taxes on importation or on the first processing of materials which are entirely imported. By imposing import charges in these acts it was possible to avoid the almost insuperable difficulties in the way of separate tariff legislation on specific commodities or groups of commodities and to lessen the chances of a Presidential veto.

The Internal Revenue Act of 1932 imposed excise taxes on imports of lumber, coal and coke, copper and copper products, and petroleum and petroleum products. These taxes, urged largely as emergency measures, were first imposed for 2 years, but were later extended to July 1, 1939.

Agitation by certain farm groups came to fruition when the Internal Revenue Acts of 1934, 1935, and 1936 completed a thoroughgoing system of charges on imported animal and vegetable oils and oilseeds. The duties on such oils in the Tariff Act of 1930, applying chiefly to edible oils, were extended and supplemented by taxes on imports, or on the first processing in the United States, of soap and paint oils. Coconut oil is subjected to a processing tax of 3 cents per pound if made of Philippine copra, of 5 cents if made of copra of any other origin. This marks, in effect, a departure from the policy of admitting all commodities from the Philippines free of duty.

A second consequence of the depression was a tendency toward quantitative limitations on imports. Absolute import quotas have been imposed by direct governmental action on sugar from all sources, on tobacco from Cuba, on cordage from the Philippines, and on red cedar shingles, which come entirely from Canada. The import quota on sugar, imposed contemporaneously with a reduction in duty on Cuban sugar, is part of a general quota arrangement applying also to marketing sugar produced in the United States and its possessions, including the Philippines; that on Cuban tobacco followed restrictions on marketing of domestic cigar tobacco and lapsed with their abandonment.

In addition to these quotas imposed by the United States Government, informal agreements were made with foreign countries whereby they restricted exports of certain commodities to the United States to a stated volume or percentage of United States consumption. The first agreements of this kind resulted from the regulation of industry under the National Industrial Recovery Act and were in lieu of action, under that law, directly restricting imports.

Recently the tendency has been for domestic and Japanese producing interests to make private agreements in which the Japanese obligate themselves to limit their shipments to the United States and the Americans bind themselves not to seek further governmental restrictions on imports. Early in 1937, private agreements were made regarding cotton cloth, on which duties had previously been increased under the flexible tariff provision, and regarding cotton hosiery, cotton velveteens and corduroys, on which investigations under that provision were in process. Moreover, the intergovernmental agreement for a limitation of Japanese exports of cotton rugs to the United States was transformed into a private agreement. Arrangements such as these result in a division of the market between Japanese and American producers.

Despite the developments outlined above, certain underlying factors were working toward more liberal foreign trade policies.

In the first place, since the World War, the United States has occupied a creditor position. However, the direct influence on tariff policies of this change from its traditional debtor position has been small. Certainly the change did not prevent an increase in the tariff in 1921–22 nor in 1930, although in the intervening years the United States strengthened its creditor position by making large private loans and investments abroad.

More important was the domestic agricultural situation. Before the depression, and more markedly during it, United States exports of agricultural products declined. Large surpluses of commodities accumulated, and prices fell to unprecedentedly low levels. In consequence it became essential to general recovery that domestic agricultural production be drastically restricted or that lost export markets be regained.

Another significant factor was the foreign-trade policies of certain countries, their effects on American trade, and the attitude in opposition to them adopted by the Department of State.

The logic of the tariff policy and economic position of the United States led the Department of State, beginning in 1922, to support the unconditional form of the most-favored-nation clause. This reversal of a traditional policy corrected an anomalous situation. Although prior to the passage of the Trade Agreements Act in 1934, the United States had a single-column tariff except for exclusive concessions to Cuba, nevertheless it formally adhered until 1922 to the principle of unequal tariff treatment as expressed in the conditional form of the most-favored-nation clause. It, therefore, could not consistently demand most-favored-nation treatment from countries having multiple-column tariffs. By adopting the unconditional clause the United States, as did the United Kingdom long before, put itself in a better tactical position to insist upon being given lowest tariff rates without any compensating concessions.

After 1930 many countries adopted quantitative limitations on imports and clearing agreements obviating the use of foreign exchange. Countries using these new methods of reducing trade developed also a tendency toward bilateral trade balancing. Because of this tendency and of difficulties in meeting their obligations to the United States, with which most of them had adverse trade balances, European countries were prone to use quotas to reduce the proportions in which various articles were imported from the United States. The Department of State made frequent protest against quotas in general and specifically against their use to discriminate against American trade.

The contraction of markets for American exports, to which multiple-column tariffs, quotas, and clearing agreements had materially contributed naturally suggested that the United States should take the lead in a program of mutual reduction of trade barriers, particularly since the tariff policies of the United States had helped create the situation.

The factors discussed above had their influence, but together they would not have sufficed to bring about the turn in 1934 toward more moderate tariff policies had the Democratic Party not come into power in 1933. Despite protectionists in its ranks, that party stood committed by tradition and platform to tariff reduction. The tradition in this respect has been strongly reinforced by the leadership of Secretary of State Cordell Hull.

With the active support of the Roosevelt administration a law was passed, against strong opposition, in June 1934 authorizing the negotiation of reciprocal trade agreements. This authority, at first granted for 3 years, was in 1937 extended to June 1940. Under it the President makes agreements with foreign countries for mutual reductions in trade barriers. These agreements become effective by proclamation of the President without submission to the Senate for ratification. His power, however, is limited by a provision forbidding any increase or decrease in duty of more than 50 percent or any transfer between the dutiable and the free lists.

An important provision of the Trade Agreements Act requires that concessions made to any one country shall be generalized on the principle of equal treatment of all countries. The act itself, however, authorizes exclusive concessions to Cuba. It also specifically authorizes the President to suspend extension of concessions to any country found to be discriminating against the commerce of the United States. However, although many countries discriminate in one way or another against American trade, only two—Germany and Australia, which have done so openly and flagrantly—have so far been denied the benefits of concessions made to other countries.

The practice of extending to all "nondiscriminating" countries the concessions made in any agreement has influenced the character of concessions made by the United States in much the same way as it has influenced those made by other countries pursuing the same policy. In order to reserve bargaining power for other countries the United States has followed the general policy of confining concessions to any country to articles of which that country is the principal or a high-ranking supplier. On the whole, the rule has worked out well, although occasional difficulties have arisen.

The effort to meet the demands of a particular country without serious impairment of bargaining power needed for other countries has given rise to further refinement in tariff classification. Although a country may not be the principal supplier under an existing classification, a subclassification may sometimes be made to cover the particular variety of which it is the chief source.

As a precaution against the possible effects of extending concessions to third countries, most of the trade agreements provide that should third countries obtain the major benefits of any duty concession, and should an unduly large increase in total importations result, the concession may be withdrawn or a quantitative restriction imposed. This provision is a weapon to be used in extreme circumstances to protect a domestic industry from ruinous competition from third countries. In case either country acts under it, the other country has the right to terminate the agreement.

So far trade agreements have been made with 16 countries (including Cuba), which together supplied in 1935 41 percent of United States imports and took 34 percent of United States exports. Concessions made in these agreements affect every schedule of the tariff act and, taken together, constitute a substantial tariff reduction. On about 440 dutiable items out of about 3,200, duties have been reduced to all nondiscriminating countries, and on 25 additional items exclusive concessions have been made to Cuba. These items represented about 25 percent of the dutiable imports in 1935. In addition, duties have been bound against increase on 23 items accounting for more than 2 percent of dutiable imports in that year, and free entry has been bound on 77 items constituting more than 35 percent of the free imports. A simple average of the percentages of reductions on items on which duties have been lowered in agreements is about 35 percent. These reductions, and the substantial concessions received in return for them, have contributed materially to the recovery of the foreign trade of the United States since 1933.

The countries other than Cuba with which trade agreements have been made are Canada, six European countries—Belgium, Sweden, the Netherlands, Switzerland, France, and Finland, and eight tropical American countries—Haiti, Brazil, Colombia, Honduras, Nicaragua, Guatemala, Costa Rica, and El Salvador. In the agreements with the tropical American countries the United States in return for duty reductions, chiefly on manufactures, binds the free entry of such tropical products as coffee and bananas, the principal exports of those countries, and grants duty reductions on the few dutiable articles coming chiefly or largely from those countries.

A survey of the principal problems arising in the negotiation of the trade agreements so far made may prove of interest.

One problem is connected with the program of the New Deal for governmental regulation of agriculture and industry. Provisions of law have been enacted authorizing additional import restrictions when necessary to safeguard against such increases in imports as may render these programs ineffective.

To meet this situation the provision in trade agreements prohibiting quotas on imports of concession articles makes exception of quotas imposed "in conjunction with governmental measures operating to regulate or control the production, market supply, or prices * * * or (in some agreements) tending to increase the labor costs of production." This exception was not invoked under the National Industrial Recovery Act or the Agricultural Adjustment Act, both no longer in force, nor has it been invoked so far under the still effective Soil Conservation Act. The labor-standards bill now pending before Congress, like the acts named, authorizes action to prevent measures taken under it from being rendered ineffective by excessive increases in imports.

Another difficulty is that in a number of countries quota limitations are for many commodities the effective form of import restriction. So far agreements have been made with three such countries, Switzerland, the Netherlands, and France, largely on the basis of duty concessions by the United States in return for quota concessions by these countries. In each case, however, the European country also made some duty reductions.

In dealing with the quota problem, the United States insists only that it be given a fair share of any quota established on any article in which it has an interest. The trade agreements provide that in the case of quotas established by either party the other party shall be given a share based upon its position as a supplier in a representative period prior to the imposition of quantitative restrictions. Both parties to the agreement are left free to discriminate among the other supplying countries. Thus, the United States, although itself maintaining a policy of equal treatment, has not attempted to effect the complete reform of a country's trade policies as the condition of making an agreement with it.

In order to prevent apprehension on the part of the interests involved and to avoid the possibility of serious injury to them, the United States, in reducing the tariff on certain agricultural and forest products in its agreement with Canada, resorted to the use of "tariff quotas" limiting the increase in imports at the reduced duties. Imports in excess of specified quantities of heavy cattle, calves, milk cows, cream, seed potatoes, and lumber of Douglas fir and western hemlock, remain dutiable at the full rates. Although these tariff quotas are global, they have not been allocated among supplying countries, since the commodities in question come either exclusively, or almost exclusively, from Canada. In 1936 the quotas for heavy cattle and calves were filled and, in addition, small quantities came in at the full duty. The effective limitations on imports of the other four commodities were the reduced duties, as in no case were the quotas filled.

An entirely different problem arises with countries which have multiple-column tariff systems and which refuse to extend most-favored-nation treatment automatically in return for such treatment. Agreements have already been made with two such countries, Canada and France. Canada granted the United States the lowest non-Empire rates on all products; France, the lowest rates except on a limited list of articles with respect to which the United States has no important interest.

Uncertainty concerning the stability of currency values has created still another difficulty. This has been met by a provision in a number of agreements that should "a wide variation occur in the rate of exchange between the currencies of the two countries * * * the government of either country * * * shall be free to propose negotiations for the modification" of the agreement or for its termination. No use has been made of this provision, although it is in the agreements with Belgium, Switzerland, the Netherlands, and France, all of which have since devalued their currencies.

Of the countries with which agreements have not yet been made, some present in more acute form certain of the problems discussed above, or present other and more difficult problems.

A number of these countries are principal or important suppliers of few, if any, of the commodities imported into the United States. With them it will be difficult to go beyond limited agreements based largely on mutual most-favored-nation treatment. The advantage accruing to any country from the extension to it of concessions made to other countries grows, however, with the number of such concessions.

A greater difficulty will arise in making trade agreements on the unconditional most-favored-nation principle with countries which have rigid exchange controls, which subject imports to licensing without fixed global quotas, or which have entered into clearing agreements covering the bulk of their trade. Obviously these arrangements might nullify any duty or quota concession made in a trade agreement. So far, the United States has made no agreement with any country pursuing these policies in a pronounced form although negotiations with Czechoslovakia have been announced. Switzerland has a number of clearing agreements, but they do not affect, to any great extent, the commodities which Switzerland might be expected to import from the United States. Moreover, Switzerland has not exercised any rigid form of exchange control.

Even greater are the difficulties in the way of agreements with countries, such as Germany, which conduct their foreign trade and exchange transactions on bases diametrically opposed to those of the United States. Under present conditions it would be difficult to find even a modus vivendi which would partially bridge the gap separating the two foreign-trade systems. In the case of the Soviet Union, however, a satisfactory method of accommodation has been found. Agreements have been made for a year at a time in accordance with which the United States undertakes to extend to the Soviet Union the tariff concessions made in trade agreements with other countries, in return for the promise of the Soviet Union to take a specified minimum total value of American goods, or, as in the agreement for 1937–38, to increase its takings of them.

But the most pressing problem, from the standpoint of further progress in the trade-agreements program, relates to the agricultural situation, both in the United States and in foreign countries. In this regard the principal countries with which the United States has yet to make agreements fall into two groups: In the one are the primarily agricultural countries of the Temperate Zone, such as Argentina and Australia, which import from the United States chiefly manufactures and which export principally agricultural products more or less similar to those produced in the United States. In the other are primarily industrial countries, such as the United Kingdom, Germany, and Czechoslovakia, which afford principal markets for agricultural products of the United States and which export principally manufactured products.

The concessions which the United States can make to the agricultural group of countries must consist principally of duty reductions on agricultural commodities more or less competitive with domestic production. Such reductions may be difficult, however, owing to the persistent tendency toward agricultural protection in the United States—a tendency which is the harder to combat because of the contraction of export markets for American farm commodities resulting from the extreme agricultural protectionism prevalent among European countries. In fact, it may prove impossible to lower duties on typical products of the agricultural countries unless further concessions can be obtained from the industrial countries of Europe affording increased export opportunities for American agricultural products. In the agreements so far made substantial concessions have been secured on certain classes of these products. In general, however, the largest agricultural import markets are in countries with which agreements are yet to be negotiated.

The negotiation of a trade agreement with the United Kingdom presents special problems. Inasmuch as the United Kingdom has been the principal market for American agricultural products, and inasmuch as the British tariff and imperial preferences tend progressively to reduce the share of the British market obtained by the United States, the procurement of more favorable treatment for these products in that market is a sine qua non of any agreement in which the United States may make substantial reductions in duties on imports of British manufactures. The principal obstacle is the Empire preferences under the Ottawa agreements.

The origin of this situation is interesting and instructive. In 1922 and 1930 the United States raised its tariff. The consequent decline in American imports of the agricultural products of the Dominions, and of the manufactured products of the United Kingdom, was an important contributing factor to the negotiation of the Ottawa agreements, which resulted in a further shifting and reduction of trade to the detriment of the American export trade in both agricultural and manufactured products. The United States now seeks trade restoration through agreements with British countries. Already it has made an agreement with Canada resulting in a mutual increase in trade. Its ability to reach similar agreements with other self-governing dominions, such as Australia and New Zealand, depends largely upon whether it can negotiate a satisfactory agreement with the United Kingdom for a reduction in the preferences accorded the dominions on agricultural commodities with respect to which the United States is on an export basis.

H. R. 7800

EXTENSION OF REMARKS

OF

HON. FRED BIERMANN

OF IOWA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, November 30, 1937

ADDRESS BY HON. FRED BIERMANN, OF IOWA, BEFORE THE ANNUAL CONVENTION OF THE NATIONAL OIL MARKETERS ASSOCIATION IN CHICAGO, OCTOBER 13, 1937

Mr. BIERMANN. Mr. Speaker, under the leave to extend my remarks in the RECORD I include the following address delivered by me before the National Oil Marketers' Association in Chicago, October 13, 1937:

Mr. Toastmaster, ladies and gentlemen, I appreciate very much the invitation to be here this evening. I have developed a considerable admiration for this organization of yours, and I shall say frankly a large part of it is due to the kind of men, like Mr. Wilson, who have called on me in Washington. Someone said to me this afternoon he was afraid we were having too much legislation for groups. It may be bad for the country, he said. I think that is true. I think there has been too much of this kind of attitude in organizations. They have come down to Washington or have written down to Washington and have had about this attitude:

"We have so many members in your district (or in your State); therefore we want you to vote for (or against) certain bills."

I think for quite a number of years past we have had put upon our statute books laws that never would have gotten there by their merits, but were put there because some organized group put fear into the hearts of legislators. But the National Oil Marketers have never adopted that attitude. Paul Hadlick has called on me a number of times. Every time he has talked to me he has given me the reasons why he thought such a thing ought to be done, or why such a thing ought not be done. That is the kind of representation I believe any group of people or any organization ought to have in Washington. You are not going to get any bad legislation with that kind of argument. He never told me how many members he had in the Fourth District of Iowa.

I know very well that I, a newspaperman, cannot tell you men anything about the oil business. I am not here for that purpose, but I am here to talk just a little while about the kind of things that have interested me in the problems that confront you.

I think this is a day and age when the people have awakened to the fact that something has to be done to protect the independent merchant in the business life of our country. If that is not done, the young men of the future are not going to be able to look forward to the time when they can be their own bosses. The best they can look forward to is for some promotion in the employ of some corporation. Unfortunately, these young men get too old for the corporations very early in life.

I mentioned to one of the newspapermen here this afternoon that I attended a meeting in Des Moines some years ago of the Iowa Press Association. One of the large advertising agencies of the country had a man there to speak to us. This man astonished me by saying that the oldest man in their corporation was 42 years old.

This corporate ownership and this corporate method of doing business tends toward putting the deadline on people very early in life.

Some years ago there was chaos in the producing and refining petroleum fields, such chaos that the independent States could not contend with it, and that problem, like many others, was thrown into the lap of the Congress of the United States. The result was the Connally Hot Oil Act, which had a couple of purposes. You know one of them ostensibly was to conserve the oil resources of the United States, the other was to bring some kind of system out of the chaos, so the producers and refiners, instead of cutting each other's throats, would have a reasonable chance to make some money.

I suppose to some degree the Connally Hot Oil Act has conserved the oil resources of the country, but I think it has not done that so perfectly as it has accomplished the other purpose. Tariffs have kept out gasoline and oil from foreign countries, which could aid in the conservation of our resources here. Every year we ship out a great deal more petroleum products than we ship in. But as far as bringing order out of chaos for the producers and refiners, it did a fine job. The producers and refiners in the United States have made money. I want them to. I want every legitimate business in the United States to make a reasonable profit. But unfortunately this act has produced a control of production which has been followed by price control in the marketing field. It has produced a condition you men know far better than I, a condition that has made the position of the independent marketer precarious. I want to read you some short excerpts from a few of many letters I have received from every corner of the United States.

This is a postcard from Texas. I shall not read the names of the signers.

"I want to congratulate you on your bill H. R. 7800. If passed it will be the salvation of the independent oil men. The big companies take losses on one and make it up on another; by shifting these profits and losses they eliminate the independents. It wouldn't be so easy to do this if they didn't control production."

The Congress of the United States, when it passed a law designed to make it possible for the producers and refiners to make a decent profit did not intend that the producers and refiners should make their profit at the expense of almost the existence of the independents.

This man writes from Seattle, Wash., speaking of this bill:

"Your stand in this matter will be greatly appreciated by all independent marketers of petroleum products as well as by the fair-minded public, both of whom are being injured by the major oil companies' methods. There should be no place in our economic structure for trusts so powerful as to exert a strangulating control over a commodity so necessary to our national welfare and prosperity as oil."

One from Wisconsin: "On my return from France I went to work for a big major oil company. Then in 1921 started my own business. Now with the tactics of the major oil companies I am confronted with a situation that is beyond my control and if it is allowed to continue I am just on my way out of the oil business."

One from Nebraska: "The major oil companies are using very unfair means in competing with the independent marketer. I hope you will be successful in bringing your proposed bill into a law."

One from Kansas: "Where the supply is controlled and an arbitrary figure set for the price at which it is sold in tank-car lots, and on the other hand the retail price also set by the same organization that supplies the commodity, it places a noose around us at all times. The major oil companies are in the habit of tightening this noose at opportune times."

One from Massachusetts: "We have been in the marketing of petroleum products for the past 12 years and found ourselves able to make a living until the major companies began breaking down our margins. Our present margins are so small that we cannot compete with these large companies because of revenues they receive from other sources in marketing."

That reminds me that in my State of Iowa in August the Government of the United States asked for bids on its needs for

October, November, December. Every single drop of that material was bid in by major oil companies, of whom I have a list in this letter. I checked those figures with the purchasing division of the Department of the Treasury when in Washington a few days ago. The figures here show what this was bid at and also the cost figures to the independent marketers in the State of Iowa.

A letter from Minnesota: "I am delighted to express my hearty approval of your bill H. R. 7800, which bars major oil companies from marketing. Your bill will have a stabilizing effect on the oil business and save the independent oil marketer from bankruptcy and ruin."

A letter from Illinois: "The passage of this bill will afford the protection which the independent oil marketers need if they are to continue in business in competition with the major oil companies. The major oil companies for years have been forcing the independent marketer out of business through maintenance of low margins that do not give the independent a marketing profit. The major oil companies absorb their marketing losses in other lines of business. Your bill gives the independent marketer a new lease on life."

Speaking of major oil companies absorbing their marketing losses out of other activities, I suppose some of you may have done me the honor to have read a speech I made the 26th day of July in which I set out an excerpt from a prospectus issued by the Texas Corporation, dated February 5, 1937, in which they explained the reasons why that prospectus shows their marketing operations have for years shown a loss. They say that is the customary thing among the big companies and it is not considered bad business practice. Of course, if the major oil integrated companies do that, if they take a loss in the marketing business, it certainly cannot be expected the independent fellow is going to continue to exist if he has to make a profit where the big fellows make a loss.

Here is one from Missouri: "Independent dealers are very important to the oil industry. They prevent absolute monopoly, employ a relatively larger proportion of people to transact the business than the major companies whose vast organizations are already flexible enough to absorb additional business without increasing employment, and for each independent who, through unfair price competition, finds it necessary to fold his tent like the Arab, such failure becomes an actual tragedy to many independents."

A point was made to me this evening after I came in, that by making the marketing of petroleum products an unprofitable business, the major oil companies are not only working a hardship on the independents but they are working a hardship on the tax-collecting bodies of the United States. There are hundreds and thousands of independents in the United States who, if they were making a fair profit, would be very nice taxpayers to the community, the State, and Nation, but, being forced to operate at very small margins and many at a loss, the Government of the United States, from the community up through the State and Nation, loses probably millions and millions of dollars in taxes which they would receive if the marketing business were allowed to stand on its own footing.

I have other letters here, but I shall not trespass upon your time to read them.. My bill 7800, to which these letters have referred, is not a very long bill, and I presume Paul Hadlick has some copies available. The meat of the whole bill is contained in section 3:

"It shall be unlawful for any person or affiliate of such person, directly or indirectly, to engage in the marketing of petroleum products and at the same time be engaged in one or more of the other three branches of the petroleum industry—namely, production, refining, and transportation."

There are good precedents with this kind of legislation. About 30 years ago a Congressman from my State named Pete Hepburn sponsored a bill known now as the Hepburn law. At that time it had been discovered that a coal-mining company that did not own a railroad could not compete in marketing with a coal-mining company that did own a railroad. So the Hepburn law provided that mines and railroads should not be under the same ownership.

During the war the Government investigated the packing situation in this city. The upshot of that was a consent decree in 1920 under which the big packers agreed they would not engage in the retailing of meat for the very good reason that an independent retailer could not compete with a neighbor who was part of a great packing company.

In the State of North Dakota, recently, they passed a law which forbids a producer of motion pictures to also operate a theater, the reason for that being the same as that behind the Hepburn law, and behind this consent decree, that the independent buyer of films cannot compete with the man running the theater next door if the man next door is a producer of films.

The last several years the Congress of the United States has given evidence that they want to maintain in existence the little independent fellow over the United States. [Applause.] The Robinson-Patman Act was an example of that. That act was designed to protect the little merchant from unfair competition by the big fellow, nothing more; just to give him a fair shake.

At the last session of Congress there was passed an amendment to another bill, a measure which permits a State having an anti-loss-leader law to enforce that law.

I merely cite these things to show you the Congress is minded to protect the independent merchant of the United States. I believe all that is necessary for the passage of this bill into law is that the independent marketers of oil in the United States present their case to the Congressmen of their districts and to their Senators. I most strongly urge you to do that.

The more I investigate this situation, the more I am persuaded that something like this has to be enacted into law if we are going to continue to have independent oil marketers in the United States.

They say everybody who goes to Europe wants to talk about it when they get back. I have tried to avoid that, but I have been back so recently maybe you will pardon me.

As is my custom when I am anywhere out of my own community, I made inquiries regarding conditions there. I was very much impressed with the fact that in France almost all the business is conducted by individual or family ownerships. There is very little of this chain ownership, very few of these great concerns that by their very size menace the little fellow. The upshot of it is that France has been going through a period of stress, I think, worse than we have gone through, is now confronted with a situation a thousand times more serious than confronts us right now, and she is in reasonably good shape. By the official reports in France in September, only some 300,000 are unemployed, not very many for a nation of 40,000,000 persons. I wish our percentage was not any larger.

I can very well imagine that one of the reasons for that comparatively little unemployment is the fact there are so many individual establishments, so many little ownerships of individuals or families that don't draw the 40-year age limit and that are not so greatly affected by these waves of depression that go over a country now and then.

I am not one of these business baiters. I never have thought it was statesmanship to attack any concern merely because it was big, but I do believe it is statesmanship that if you have to choose between the welfare of the great big fellow and the welfare of a thousand or ten thousand little fellows you choose the little fellows.

I do not believe the bill, if enacted into law, would have anything but good effect on the big fellows. Their own statements show they lose money on their marketing in many instances. If they can stop that loss it is going to be better for them financially as well as better for the little fellow.

This has been a rambling talk, and I apologize for the disconnected nature of it. I know I cannot present to you gentlemen any facts of which you are not aware yourselves regarding the oil business, but I want to leave with you this thought. I am not on the committee to which this bill goes. But I am satisfied this bill can be enacted into law if the members of this association, each one individually, makes it his business to write to his Congressman and his Senators, to give the reasons why this bill should be enacted into law, and if possible give some item of your own experience you can vouch for.

Again I thank you very much for inviting me here and for listening so courteously and patiently to this rambling talk.

The Farm Bill as Applied to Cotton

EXTENSION OF REMARKS

OF

HON. H. P. FULMER

OF SOUTH CAROLINA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, November 30, 1937

Mr. FULMER. Mr. Speaker, ladies and gentlemen of the House, what I shall have to say on the farm bill today will apply to those provisions relating to cotton. The cotton subcommittee, composed of myself as chairman, DOXEY, of Mississippi, COOLEY, of North Carolina, OWEN, of Georgia, and KLEBERG, of Texas, with the chairman of our committee, Mr. JONES, sitting in when possible, have done our best to present to the House a cotton bill, simple, fair, and written in definite terms, so that it would not only be readily understood by the Members of the House, but to the average cotton farmer down in the cotton States.

As far as I am concerned, the great trouble with the average bill passed by the Congress is we do not write in the bill definitely just what we want done when the bill is put into execution by those who administer same. As a businessman and as a farmer I do not like such language as the following: "The Secretary may take into consideration half dozen different things in attempting to do any one thing." "The Secretary may do thus and so, if practicable." In the next place, the Secretary is permitted to write various rules and regulations in carrying out the provisions of the act which can be so written and so administered that the real purpose and intent of the legislation is not put into execution.

Now, let us see what we propose for cotton: In the first instance, the Secretary is to take into consideration the trend

of the cotton business from every angle, the number of bales that will be necessary, for instance, in 1938, to supply our domestic and foreign demand, and in so doing he will take into consideration the amount of the surplus cotton on hand.

I want to call to your attention at this time that because of the large crop of 18¾ million bales of cotton this year, with the carry-over from 1936, we will carry over into 1938 a surplus of around 13,000,000 bales of cotton. This is really enough cotton to take care of our domestic and export needs for the next 12 months without producing a single bale of cotton. In other words, if we did not produce over 5,000,000 or 6,000,000 bales of cotton in 1938, we would have a large, normal carry-over for 1939. Therefore, facing this large surplus and knowing that we should not, at least, during the first 1 or 2 years, cut the acreage and production too drastically.

It was our thought that a crop of about 10,000,000 to 11,000,000 bales of cotton would be the proper goal for 1938. Now that the Secretary will decide, as stated, on a 10,000,000 or a 11,000,000 bale crop for 1938, he would proceed to ascertain the national average production per acre during the past 10 years. I understand this would amount to 200 pounds of lint cotton per acre. Based on this percentage per acre, the Secretary would ascertain the necessary national acreage required to produce the 10,000,000 or 11,000,000 bales of cotton. If you will figure this out, you will find that it would take 25,000,000 acres, with an average of 200 pounds per acre, to produce a 10,000,000 bale crop. Twenty-eight million acres on this basis would produce normally 11,200,000 bales of cotton. This procedure would be carried on down to the cotton-growing States so as to ascertain the number of bales and the number of acres to be allocated to the various cotton States. After the allocation has been made to the States, suppose we will say that 1,000,000 bales have been allocated to the State of South Carolina. This we will take for granted is the proper allotment under the program to this State.

The Secretary would then proceed to get the average production per acre in the counties of the State and would allocate the proper acreage to each county so as to take up the State allotment, less 5 percent set aside to be used in taking care of new producers of cotton and additional acreage to small landowners and tenant renters.

After the acreage allotment has been made to the county the Secretary will then take into consideration the tilled acreage on each cotton producer's farm, dividing the allotted acreage on an equal percentage basis according to the number of tilled acres in each farm.

In allocating acres to the various States, as stated, the Secretary would take into consideration the average production per acre, which would put him in a position to deal fairly with each State, as well as the various counties in the State. The average production per acre will differ in the various States and counties; so will the acreage allotted to the various States and counties; but the percentage of acreage to any and every farmer in any county will be the same. Take my own county—Orangeburg—the largest cotton-growing county in the State. Suppose the average production per acre amounts to 200 pounds, and the Secretary finds that it will take 40 percent of the tilled or cultivated acreage on the cotton farms in this county to take up the proper allotment from the State cotton and acreage allotment, on a farm cultivating 1,000 acres of tilled land the farmer would receive 40 percent of this acreage, or 400 acres for cotton; a 500-acre farm, 200 acres for cotton. In other words, all farmers would, as stated, get the same percentage.

You will note, however, that we have set aside 2½ percent of the total State acreage to be used in taking care of new producers on new lands where cotton has not been planted heretofore. In the meantime, we have set aside 2½ percent to be used by the Secretary in allocating additional acreage to small farm owners and tenant renters where their allotted acreage does not exceed 15 acres per farm. This will tend to give these small farmers a small advantage over the large cotton producers, which would be perfectly fair, especially so, in that these small farmers are not responsible for the large surpluses of 1933 and 1937.

You may ask why sharecroppers are not included in the 2½-percent allotment along with small farmers and tenant renters. This is because the landlord operating with sharecroppers always divides the cotton acreage with his sharecroppers based on the size of his family, which would accomplish the same thing that we are trying to do for small landowners and small tenant renters.

The bill further provides that if the cotton crop, for instance, of 1938, should indicate an overproduction, the Secretary may call for a referendum on the part of cotton producers, and if two-thirds of the farmers vote affirmatively a marketing quota will be placed into operation. However, this will not affect farmers who are cooperating and who do not plant a larger acreage than the number of acres allotted to them in line with the proper percent of the tilled or cultivated acres on their farms. In other words, this bill permits cooperating farmers to sell all of the cotton that they may produce on their allotted acreage.

In that we are allotting acreage and not an allotment of bales of cotton, and, as stated, in that the cooperating farmers can sell all that they produce, this should tend to encourage better farming as well as the producing of larger yields per acre.

What about the farmer who does not cooperate? All farmers are given their proper acreage allotment, as stated, in the county. If, however, any farmer plants a larger acreage than his allotment, he is considered a noncooperator, and he will not receive any of the soil-benefit payments, the parity price, or the 3-cent adjustment payment; neither will he be permitted to secure loans under the loan program on his cotton. In the meantime, he will be taxed 2 cents per pounds on that portion of cotton produced over the average production on his allotted acreage.

This bill authorizes the Secretary, in allotting acreage to a producer who produces two or more of the products contained in this bill, cotton, corn, tobacco, wheat, and rice, to take this into consideration so that the acreage allotted will be equitably allotted to take care of a proper acreage for these commodities.

In other words, if a farmer in South Carolina plants cotton and tobacco, he will not get a full acreage allotment for each of these but will be cut down on both, so as to place his allotted acreage on an equal basis with other farmers who plant only tobacco or cotton.

Suppose some large cotton producer has discharged his sharecroppers or is working his farm with machinery and wage labor. This farmer, under our bill, would receive benefit payments and parity price payments to the extent that he would have received had he been operating his farm on a sharecrop basis.

In other words, the landlord would not receive any benefits that would have gone to the sharecropper had his farm been operated on a sharecrop basis.

At the same time the bill was considered in the Agricultural Committee I offered the following amendment, which was accepted but for some reason was left out of the bill when it was reported to the House:

> The whole or any part of a payment which may be made to a tenant or sharecropper under this section may be assigned by him, in writing, to his landlord as security for cash or advances, if the assignment is acknowledged by the tenant or sharecropper and the landlord before the county agent, and is filed with the county agent. This provision shall not authorize any suit against the Secretary or any disbursing agent if payment is made without regard to the existence of any such assignment.

I expect to offer this amendment at the proper time when the bill is being read for the purpose of offering amendments. You will note that this amendment states that the tenant may transfer in writing to the landlord any payments that may be coming to him, for instance, in 1938, for the purpose of securing cash or advances.

May I state that there are just lots of tenants at this time who, on account of the low price of cotton and because of the serious boll weevil infestation in many parts of the

cotton States, have not been able to clear any money out of their farming operations this year and who have no way of securing supplies or much-needed clothes and shoes for their families. If this amendment is adopted it will be possible for the landlord to advance to these tenants either cash or advances, which, as stated, are very much needed at this time.

Perhaps we have a great many tenants in the South who are different to the class of tenants you may have in other sections of the country. Knowing these tenants and sharecroppers as I do, if this amendment is adopted, it will tend to protect these tenants and sharecroppers to the extent that these payments will go into worth-while things which he and his family need rather than permitting him, when he receives a check sometime during 1938, to waste same in other ways than taking care of the real needs of his family. This is a very important amendment, and I hope that the House will adopt same.

As previously stated, the cotton program under this bill is a fair and definite one which can be understood by any cotton farmer.

In striving to write a farm bill, we have been confronted with various ideas as to just how farm legislation should be written. There are those who came before our committee who are very desirous to have the Congress pay to cotton producers a subsidy on that portion of the cotton consumed in the United States and let the farmers continue to produce any amount of cotton they want to, or that they may be able to produce. They give for their reasons, first, that the only way we can regain our foreign markets is to produce large crops of cotton so that the world basis price will be anywhere from 5 to 8 cents per pound. Suppose we had to pay a subsidy on this year's cotton crop, that is, that portion consumed in the United States, which is around 7,000,000 bales, so as to bring the price up to parity. The difference between the world basis price today and the parity price would be about on an average of from 10 to 11 cents per pound, which would amount to from $350,000,000 to $385,000,000. In the meantime, if you will spread this amount over the total amount of cotton produced this year, 18,750,000 bales, it would give to the producers of cotton, taking into consideration the low grades along with the better grades, an average price of about 9 cents per pound.

Everyone who knows anything about producing cotton will tell you that farmers cannot pay the price that they have to pay for that which they purchase, all of which are monopolistic fixed prices, and produce cotton at 9 cents per pound. The payment of $350,000,000, which would be to offset the tariff benefits to industry, would simply be a waste of the taxpayers' money. If we should put on this type of program, in 1938 we would see a tremendous increase in acreage, and, if the Lord were willing, we would produce another 18,000,000 or 20,000,000 bales of cotton.

The question has been asked, if, for instance, when the 35 or 40 percent of the authorized land allotted to cotton farmers in South Carolina and in the South are planted to cotton, what will our farmers do with the 65 or 60 percent of their cultivated acres? Even farmers in South Carolina will ask this question.

The answer is: They can use a proper portion of these lands under the soil-conserving plan and the growing of soil-building crops, which will tend to cut their fertilizer bill, which at this time is the most expensive item in producing crops in the South.

In the next place, they can produce crops which they are now importing from other States, so as to become self-sustaining.

Just stop and think for a moment of the millions of dollars of cheap cotton money being spent annually by farmers in the South for corn, hay, flour, bacon, and dairy products.

If the cotton provisions of this bill are properly administered it will tend to bring about diversified farming, the building up of farm lands in the South where they have been practically ruined in many instances because of a one-crop program. It would also tend to make our farmers, as stated, self-sustaining, the one thing that would do more than anything else toward bringing about prosperity and giving to this large class of people purchasing power, which they need so badly at this time, and which would place them on a higher standard of living in line with other groups.

There are many good reasons we are losing our foreign markets. I am simply going to mention a few of them in passing.

In the first place, we cut out the lending of good American money to these countries, which, prior to this time, naturally, they could use in buying American goods and our cotton.

Second. In 1930, a Republican Congress, under President Hoover, passed the Smoot-Hawley tariff bill, which practically stopped the importation of foreign goods, which would have been exchanged for our goods and for farm products, especially cotton.

Third. I am told that because of the exchange value of our currency and that of several foreign countries, they have been unable to buy our cotton.

Fourth. With the assistance of cotton-growing experts of the United States with the privilege of buying farm machinery and farm implements from the United States cheaper than the farmers who reside in the United States can buy them, naturally these foreign countries are increasing their production of cotton.

It is my prediction that, with millions of good cotton land available in Russia, and if Japan comes into possession of large areas of cotton land in China, with their energy and ability to do things, the years will not be many before these foreign markets will not be in need of American cotton.

It might be stated that it is impossible to control the production of any crop to any definite amount of cotton, for instance, in that it is impossible to control the weather hazard, boll weevil, and other insect infestation. However, if this definite and fair program is carried out over a period of years, increasing or decreasing the national acreage annually, in line with the normal crop of cotton that should be produced, having in mind, as stated, the controlling of a fair and reasonable surplus, it is my firm belief that the program would work very successfully and satisfactorily.

If you will take the average number of acres planted in cotton during the past 10 years, you will note that it will amount to about 36,800,000. The average production of cotton over this period amounts to 13,680,000 bales, including the large production in 1938. You will note from this that this average is a normal crop, and if it were possible to bring about as nearly as possible a normal production of from 12,000,000 to 14,000,000 bales of cotton, with a proper parity or adjustment payment, you would see real prosperity in the South.

The trouble under the old program is when farmers produce a short crop, brought about largely because of conditions of the weather or boll weevil infestation, the price is usually fair, but they have not the cotton for sale. In the meantime, when farmers are blessed with a crop of cotton like this year, the prices usually go down below the actual cost of production, and, in that farmers have never been able to control a large production, it usually passes into the hands of speculators, cotton mills, exporters, and others who do not produce a single bale of cotton.

This would have been the case this year had the President refused to approve the 9-cent cotton loan program. Under such circumstances poverty on the part of cotton producers would naturally force them to produce a much smaller crop, for instance, in 1938.

This, of course, would bring about better prices for cotton, in the fall of 1938, but with the bad financial condition of producers brought over from 1937, and with a small crop, even with better prices, they would not be able to pay their present and past obligations, and therefore would not have any purchasing power, the thing that farmers need today to revive a serious slump that is now happening in business.

When you see folks standing on the street corners, or paying their way to Washington to advocate this unlimited-production program, you can bet your boots that they either belong to the cotton-hog class, or that they have a selfish

ax to grind. All of these arguments about growing cotton at a price of from 6 to 8 cents, or even 10 cents, to regain our foreign markets at the expense of poverty and untold suffering and misery to our people in the South, as far as I am concerned, is disgraceful and tends to breed communism.

Washington Memorial Chapel at Valley Forge

EXTENSION OF REMARKS

OF

HON. J. W. ROBINSON

OF UTAH

IN THE HOUSE OF REPRESENTATIVES

Tuesday, November 30, 1937

ADDRESS BY HON. J. W. ROBINSON, OF UTAH, IN THE WASHINGTON MEMORIAL CHAPEL AT VALLEY FORGE, NOVEMBER 28, 1937

Mr. ROBINSON of Utah. Mr. Speaker, under the leave to extend my remarks in the RECORD, I include the following address delivered by me in the Washington Memorial Chapel at Valley Forge on November 28, 1937:

I wish to express my deepest appreciation to the persons who have made it possible for my State, Utah, to have this privilege which is accorded it today. I wish also to thank my own Governor, Henry H. Blood, for designating me to appear for him and represent the State of Utah on this occasion.

It is indeed fitting that a magnificent edifice such as this should be built on this hallowed ground to remind us of the sacrifices made by the patriots in order that free governments might live.

Few men, if any, have achieved more or are more beloved than the man to whom this chapel is dedicated. Possibly no man has won greater victories nor done more to merit the plaudits of his countrymen. However, it is not at the height of his victories nor at the time of his greatest achievements that Washington makes his greatest appeal to us. We think of him as a vigorous young colonel in the French and Indian War, leading an assault amid a hail of musket balls from the ambushed Indians, and our hearts are filled with admiration for his courage. We see him at Yorktown drawing the sword from the scabbard of the defeated Cornwallis, but showing every consideration to the Englishman that he would show a fellow officer, and we admire him for his courtesy. We picture him as the presiding officer at the Constitutional Convention, striving with might and main to harmonize the discordant views of the delegates there assembled, and we honor him for his fairness and firmness. Later we see him as he gave his Farewell Address, and marvel at his profound wisdom, but dearest to all of us is the Washington that we see on his bended knees, on the very spot where this magnificent building is erected. We love him for his humility.

"No memory," said Lord Bryce, "ever deserved more universal honor than Washington's." No occasion could be more thrilling to the genuine American than the one we have met here to commemorate. No memorial ever constructed could embody a nobler ideal or have a more worthy background than this beautiful church in which we are now assembled. How grateful we should be for such memorials. Standing as it does on the spot where the Father of Our Country in the very darkest hour of the Revolution offered humble supplication to his Divine Maker to alleviate the suffering of his soldiers that they, in turn, might be able to protect and preserve the divine principles of liberty and democracy, could it help but fill our hearts with gratitude that we were privileged to be born in America; could it help but inspire us to nobler heights of patriotism; to thrill us with an overpowering desire to be ever unselfishly devoted to the cause of true Americanism?

But is this not a very fitting time to ask ourselves what it was Washington really offered his immortal supplication for? Why was it that his 13,000 soldiers would endure "the dreadful sufferings at Valley Forge," which "have called forth the pity and the admiration of historians"? Why would soldiers remain in the Army when "their route could be traced on the snow by the blood that oozed from bare, frost-bitten feet"? Why would they remain "in the crowded hospitals, which were, for the most part, mere log huts or frail wigwams woven of twisted boughs," where many died "for the want of straw to put between themselves and the frozen ground on which they lay"? Why would these gallant men volunteer "to serve as beasts of burden, and, yoking themselves to wagons, drag into camp such meager supplies as they could obtain for their sick and exhausted comrades"? Why would Washington continue the bitter struggle when, in December of 1777, conditions became so bad that he felt constrained to write Congress the following letter?—

"I am now convinced beyond a doubt that unless some great and capital change suddenly takes place, this Army must inevitably be reduced to one or the other of these three things: Starve, dissolve, or disperse in order to obtain subsistence in the best manner they can. Rest assured, sir, this is not an exaggerated picture, and that I have abundant reason to support what I say. We have by a field return, this day made, no less than 2,898 men now in camp unfit for duty because they are barefoot and otherwise naked."

In this connection it should also be remembered that (contrary to some popular beliefs) Washington at no time was supported by a unanimity of opinion in the Colonies. Powerful groups of his own countrymen were continually striving to undermine him, and thereby defeat the cause of the Revolutionists. Mutiny, desertion, and even treason were ever on the lookout for a chance to undermine the cause of the patriots. There was no central government worthy of the name. Congress could raise no money without the consent of the Colonial governments; and even many of the Members of Congress were either lukewarm toward Washington or openly opposed to him.

Notwithstanding all these sinister forces and seemingly insurmountable obstacles, not even a shadow was cast on the shining brightness of Washington's courage. Nowhere do we read that he even entertained the slightest doubt about the righteousness of his cause or of his ability to triumph in it.

Now, again, I ask, Why was this? What was the purpose of it all; and what, if any, significance does it have for us today? What were the fundamental and underlying motives which prompted Washington and his followers to suffer and fight on as they did in the face of all the difficulties we have herein enumerated and many others which were perhaps of even greater import? Upon the answer to this question rests not only the historical value of the Revolution, but also it is determinative of the question as to whether it is worth while for us to be here on this occasion today.

For, after all, it is not the fact that Washington and his followers suffered and fought as they did, which is of concern to us; it is the purpose for which they fought that holds such magnitude of meaning for the people of America. To understand this purpose we must understand something about the history of the Anglo-Saxon people. We must go back beyond Magna Carta. We must know that Washington's ancestors had for generations before him fought for the same thing that he was fighting for—for liberty and democracy as opposed to tyranny and imperialism. The same forces which were opposed to Washington had been opposed to his ancestors in England. These forces finally arrayed themselves under the name of Tories, their opponents under the name of Whigs. But we should remember that these are only symbols of two great theories or philosophies of government. The name Whig is symbolical of liberty, democracy, and representation—in America—by population, whereas Tory is symbolical of a government by the privileged few. John Fiske has so well expressed this idea that I take the liberty of quoting the following from his American Revolution:

"While the American Revolution involved a military struggle between the Governments of Great Britain and the United States, it did not imply any essential antagonism of interests or purposes between the British and American peoples. It was not a contest between Englishmen and Americans, but between two antagonistic principles of government, each of which had its advocates and opponents in both countries. It was a contest between Whig and Tory principles, and it was the temporary prevalence of Toryism in the British Government that caused the political severance between the two countries. * * * For while, under the circumstances, a war was inevitable, it is only gross ignorance of history that would find in such a war any justification for lack of cordiality between the people of the United Kingdom and the people of the United States. As already observed, it was not a war between the two peoples, but between two principles."

So that in Washington's mind, and in the minds of his followers, two basic questions were at issue: (1) Should there be a British Empire ruled by Parliament in all its parts in America, as well as elsewhere, or should Parliament govern at home and leave the colonial assemblies to govern in America? (2) Should the English understanding of representation be imposed upon the Colonies, or should the American institution triumph in its own home?

In the last analysis, the fight was nothing more nor less than for the right of the American people to govern themselves in their own way and in accordance with the form of government they themselves saw fit to establish. The forces opposed to Washington and his followers believed fundamentally that there could be no such thing as government by all the people. Some have thought that these two opposing theories were exemplified in Hamilton and in Jefferson. Such, however, is not the case. It is true that Hamilton stood for a strong central government, while Jefferson stood for the principle of States' rights, and that there were many irreconcilable views held by these two great men; but both were ever desirous of accomplishing the same end. They differed only in the method of attaining it.

Not so with the Whigs and Tories. They differed, not only in the method of governing the people; they differed fundamentally as to the kind of government. They differed with respect to the rights inherent in the people. With this in mind, it is easy to see what significance the triumph of the Revolution has for us today. Because, had the Revolution failed, democracy, from the American point of view, could easily have been lost forever. Of course, we know from history, as heretofore indicated, that this struggle had been going on for centuries, and it detracts nothing from the greatness of Washington to keep in mind that for a hundred years immediately preceding the Revolution, many things had been going on which made Washington's victory possible. For example: During that 100 years there had been great laxity on

the part of England toward the Colonies. During that time, Parliament had extended great political privileges to the Colonies. The Colonies had, in fact, enjoyed more liberty than any other people on the earth up to that time. The new environment in the new world had established new social conditions. Isolation from the Old World had created individual hatred of restraint. The absence of political traditions made possible the institution of representation by population—self-government had taken on a new meaning. It was the purpose of Washington and his followers to capitalize upon all these things to bring about a separation from the mother country in form as well as in reality; to make forever impossible a return to the idea of the divine right of kings as opposed to the idea of the divine right of the people to govern themselves.

Now, what I want to bring home to you is this: That Washington was inspired by a great principle, namely, the principle of democracy as opposed to imperialism; the principle that the true source of government rests in all the people, not in any one class of the people. His great contribution to America lies in the fact that he won a decisive victory for the triumph of this principle. He gave to the American people the right to work out their political, economic, and social welfare in their own way, without restraint from the mother country.

But, of course, Washington's victory, important as it was, did not end the struggle; because the real purpose was not only to make us free from England but free from any and all other forces which might destroy the ultimate triumph of social, political, and economic equality; and hence no sooner did we find ourselves free from the impositions of England than we awoke to discover that the same forces which had opposed the Revolution were assiduously engaged in attempting to gain control of our Government. We were not, it was immediately discovered, free from imperialism. Freedom had been declared by the Declaration of Independence—it was by no means attained. In fact, the fight must still go on, and the real greatness in Washington is to be found in what he did to attain freedom in fact for the American people after the war was won. He wholeheartedly supported the Constitution and its adoption. He fought valiantly for the preservation of the Union and the principles embodied in the American Bill of Rights, which is only another way of saying he stood for a form of government which had for its basic object and purpose the attainment of social, political, and economic equality.

Now do not be deceived into believing that the battle began by Washington has even as yet been won. The war for social, political, and economic equality is being waged just as bitterly today as it was in Washington's time. The Tories are just as much in evidence as they ever were. They have taken on many new names and have appeared under many disguises. But the genuine American cannot help but perceive that there is still the fundamental alinement of forces arrayed against each other today as there was in the latter half of the eighteenth century. Great factions have arisen in the United States which are very evidently seeking, not the triumph of social, political, and economic equality, but the triumph of their own faction. It is not, for example, an equal distribution of wealth that many of these factions want but a distribution of wealth which will give them social and economic security regardless of how their plan might affect other elements in our society which are equally worthy and equally necessary to our well-being.

Even our great political parties, I am sorry to admit, have not been free from these sinister influences of imperialism. Too many times in our political history since Washington have political parties been willing to destroy many of the sacred principles of democracy, if to do so would give them temporary political favor. Selfishness, not equality, has been the guiding motive. Personal gain, not the general welfare, has inspired too many of our political leaders during the past 50 years of our history. The great struggle between capital and labor is basically only a fight between the principles of imperialism versus democracy. When capital seeks to get control of the Government for its own welfare, or seeks to exert any undue influence over the Government, it is fostering the principles of imperialism and Toryism. The same is true of labor or of any other faction. Under the American form of government, we must have proper representation from all these factions, and each must exercise its proportionate share of influence, and no more. No one faction, and no set of factions, must ever be in control or exercise any disproportionate influence. Labor cannot unjustly impose its demands upon capital any more than capital can take from labor what is not justly due it. To do so is not Americanism. Such procedure is diametrically opposed to the very cause which Washington and his devoted followers gave their lives to save. This does not mean that labor should not fight for what is justly due it, nor does it mean that capital should not be given every consideration which is due to it. But it does mean that neither one must be unjust to the other; and any government which permits this is not being true to the fundamental principles of the American Constitution and to the principles for which Washington fought.

What is true of capital and labor is equally true of the farmer. How far should the Government go in giving aid to the farmer? What should it do with respect to aiding the unemployed and those on relief? What should be its attitude toward the manufacturer, or to any other group which forms a part of our social and economic structure?

In America there can be but one answer to this vital question. Namely, that no group, no matter how powerful it may be as a group, should be permitted to use the Government for the perpetuation of its ideas or purposes when to do so would work injustice to any of the other groups. Under the American conception of government, neither the farmer, the laborer, the capitalist, or the manufacturer, or any other group, can be permitted to enjoy any undue advantage on the great highway which leads to social and economic equality. The American ideal requires that we all travel together. When the speed of one group is slowed up, the speed of all the rest must be proportionately retarded. Such an ideal requires every citizen, no matter what interests he may have in the progress of his own group, to have a still deeper interest in the advancement of all. We must constantly renew our covenants to this ideal, and we could have no finer opportunity for doing this than is afforded by this occasion.

Every genuine American must work for an equitable distribution of the wealth of this great Nation. He must work for an equitable wage based upon a reasonable number of working hours per week. Capital and labor both must bear in mind that individual and political selfishness is opposed to political and economic equality. And when we speak of political and economic equality in America, we do not mean, as heretofore pointed out, political and economic equality as applied to any one faction or group. We mean political and economic equality as applied to the entire Nation. And, therefore, just as long as injustices and inequalities exist among any of the various groups of our citizenry, every genuine American must be ever ready to put on his armor and do battle against these injustices. And the only armor he needs, the only armor which should be recognized in America, are the ideals for which Washington fought, the ideals of government as embodied in the Declaration of Independence and the Constitution.

What we need today are men who are deeply imbued with these ideals; men who possess more of the character of Washington; men who are thrilled with the basic ideals embodied in our American form of government; men who will, never for a moment, think of either personal or factional gain when to do so would conflict with our true, American ideals.

To me the great value and significance of this occasion is that it brings vividly to our minds the noble character of Washington and the great ideals for which he stood. To forget him and to forget those ideals is to forget the Declaration of Independence and the Constitution, and to do this is to undermine and destroy the principles for which Washington so nobly stood.

May we not conclude by reading two great tributes to the character of Washington from two of our prominent writers. John Lord said of him:

"Washington had what is as rare as transcendent genius—he had a transcendent character, united with a marvelous balance of intellectual qualities, each in itself of a high grade, which gave him almost unerring judgment and remarkable influence over other minds, securing veneration. As a man he had his faults, but they were so few and so small that they seem to be but spots upon a sun. These have been forgotten; and as the ages roll on mankind will see naught but the luster of his virtues and the greatness of his services."

James Truslow Adams in his Epic of America pays him this wonderful tribute:

"In the travail of war and revolution, America had brought forth a man to be ranked with the greatest and noblest of any age in all the world. There have been greater generals in the field and statesmen in the Cabinet in our own and other nations. There has been no greater character. When we think of Washington, it is not as a military leader, nor as Executive or diplomat. We think of the man who by sheer force of character held a divided and disorganized country together until victory was achieved, and who, after peace was won, still held his disunited countrymen by their love and respect and admiration for himself until a nation was welded into enduring strength and unity * * *. Without him the cause would have been irretrievably lost, and the thunder of the orators would have rumbled long since into forgetful silence. When the days were blackest, men clung to his unfaltering courage as to the last firm ground in a rising flood. When, later, the forces of disunion in the new country seemed to threaten disruption, men again rallied to him as the sole bond of union. Legacy to America from these troubled years, he is, apart from independence itself, the noblest heritage of all."

Undistributed-Profits and Capital-Gains Tax

EXTENSION OF REMARKS

OF

HON. ALBERT G. RUTHERFORD

OF PENNSYLVANIA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, November 30, 1937

Mr. RUTHERFORD. Mr. Speaker, since coming back to Washington for this special session I have received numerous letters from small manufacturers complaining about the undistributed-profits and capital-gains tax and they all have stated that it had had a serious effect upon their business and all stated that the tax should be repealed or modified greatly. This morning I received one letter which I believe the Members of Congress will be interested in because it

gives a concrete example of how this tax works. The following is the letter:

NOVEMBER 22, 1937.

Representative ALBERT G. RUTHERFORD,
House of Representatives, Washington, D. C.

DEAR SIR: As you will note, this company has been an operating industry in the State of Pennsylvania since 1876 and during the years of its existence it has provided the means of livelihood for from 200 to 1,200 heads of families.

It is an indisputable fact that if the undistributed-profits and capital-gains tax had been in force prior to 1930, we would now be in the graveyard of inactivity. By the same token, if these tax laws are allowed to remain on the statutes, corporations such as ours will inevitably fall by the wayside when the next period of depressed business comes to pass; and make no mistake, that regardless of all the fancy "doo-dads" which have been or will be proposed by Washington, the cycle of depression will come about at some future date.

We are no different than hundreds of corporations, not only in this State but all over the country, and we have no hesitancy about giving you a concrete picture of our situation.

At the close of business 1930, this company had prudently put aside a back-log in cash and securities of $300,000. During the subsequent 5 years, in order to remain in business and to provide employment for its old employees, the company used $275,000 of this reserve fund. A very small portion of these funds was used for capital expenditures in an effort to maintain our position in this industry.

It is essential from any sane and sensible point of view, if this company can earn a profit, that it be permitted to again reestablish its reserves to make it possible for it to weather another storm. It is further necessary that we have the opportunity of putting some of our profits into capital expenditures without jeopardizing our cash position.

Capital expenditures are a necessary part of progress, and the lack of them will do more to cause a depression than any other one factor. It should be a simple matter of arithmetic for you to realize the utter impossibility of a company making capital expenditures and at the same time paying dividends amounting to practically all of its earnings in order to escape an unjust tax. No prudent manufacturer will permit this, for the simple reason that by so doing he jeopardizes the cash position of his business and cuts his working capital to a point where he no longer can meet his obligations in an adequate manner.

The officers and directors of this company have no right to declare a dividend on its earnings this year, nor is there any justice in subjecting this company to an exorbitant tax for the retention of these funds in its business as a working capital.

Many corporations and small businesses find it inadvisable and impossible to disturb their cash position, with the result that dividends will be paid to stockholders in stock other than that on which the profits are made or in long-term notes which may or may not be interest bearing. Is it, in your opinion, fair that the stockholders of these small corporations be subjected to an income tax on this character of earning.

The first consideration of this special session of Congress should be the repeal or the modification of these tax laws. This is no time to be discussing antilynching laws and long-term farm programs and the like. Rather it is the time for immediate and concrete action on the laws which have more to do with the present business recession than any other factor.

Repeal is preferable, but if modification is deemed advisable we would suggest that corporations such as ours be permitted to create a backlog of cash surplus to the amount equaling a considerable percentage of its capital stock.

These tax laws should have your attention now—not next year.

Hoping for your cooperation, we are,

Yours very truly,

HENRY H. SHEIP MFG. CO.,
E. F. JOHNSTON, JR., *President*.

Mr. Speaker, it is small companies like the above that are the employers of labor all over our country. When they are busy and in a healthy going condition the country is in a prosperous situation. When they are slack, business throughout the country is bad. These small manufacturers want Congress to relieve them of this obnoxious tax, not next year, but now. Business is the goose that lays the golden egg of prosperity. The President for the past 4 years has been chasing the goose all around the lot with a big stick and yet wondering why it did not continue to lay eggs. He evidently has found out that fowl seldom lay when on the run and frightened, so he has stopped swinging his big stick and has thrown out a little corn of promises with the hope that the goose—business—will get back on the nest and start laying again. However, business has been fooled so many times that it is a little skeptical. The situation reminds me of an old fellow who was called as a witness in court, and he was asked about the truth and veracity of one of his neighbors. The old fellow, with a squint in his eye, looked at the lawyer and said, "I don't know nothing about his truth and veracity, but I do know that when he wants his stock to come for feeding that he has to have his hired men call them." Perhaps, if the President would allow his men in Congress to get busy at once and repeal this tax, then the businessmen of the country would believe that he really wants to cooperate with them. Let Congress act now and not wait until next year.

Reduce the Premiums for Insured Institutions

EXTENSION OF REMARKS
OF
HON. BRENT SPENCE
OF KENTUCKY
IN THE HOUSE OF REPRESENTATIVES
Tuesday, November 30, 1937

ARTICLE BY HON. BRENT SPENCE, OF KENTUCKY, IN THE CURRENT ISSUE OF THE AMERICAN BUILDING ASSOCIATION NEWS, ON THE BILL H. R. 6929

Mr. SPENCE. Mr. Speaker, under the leave to extend my remarks in the RECORD, I include the following article written by me, appearing in the current issue of the American Building Association News, on the bill H. R. 6929:

REDUCE THE PREMIUMS FOR INSURED INSTITUTIONS

(By the Honorable BRENT SPENCE)

H. R. 6929 which I introduced in the Seventy-fifth Congress would amend section 4 of the National Housing Act which established the Federal Savings and Loan Insurance Corporation insuring the savings of the public in savings and loan associations, building and loan associations, cooperative banks, and homestead associations. The amendment would reduce the premium charged insured associations by the Corporation from one-eighth of 1 percent of the total amount of the accounts of the insured members and creditor obligations of the insured institutions to one-twelfth of 1 percent. It would also provide that the Insurance Corporation out of its premium income would pay for all regular examinations of insured institutions made by the Insurance Corporation. In both of these respects it follows the precedent of the Federal Deposit Insurance Corporation and the insurance of bank deposits.

One need only reflect on the banking difficulties from 1930 to 1933 and, in fact, during much of the previous 10 years as well, to be convinced that associations should not pay a higher rate than should banks. Ideally the insurance premium rates paid by all these financial institutions should be based upon actuarial experience. As a practical matter there is no such ideal solution as to rate because in both cases it is improbable that there will be an exact repetition of previous experience.

Lending practices have changed, supervision in the future will be different from what it has been in the past, and no business cycle which is the major cause of losses is exactly like any previous one. We may reasonably expect under the constructive laws providing for insurance of financial institutions, recently enacted, that these business cycles affecting such institutions may not occur or if they should occur they will come with diminished severity.

Consequently, as a general proposition, there are no convincing figures as to just what the rate paid by banks or that paid by savings, building and loan associations should be, but savings and loan associations certainly warrant as favorable a rate as that paid by banks. The premium rate termed an assessment rate in connection with the Federal Deposit Insurance Corporation is one-twelfth of 1 percent of the bank's deposits.

Actual losses of the public in building and loan associations have been surprisingly low. Only 34 building and loan associations failed in the period from 1878 to 1920. Accurate figures of failures and losses have been kept since 1920. Complete figures for 1936 are not yet available, but losses last year were almost certainly less than in the previous 3 or 4 years. In the period from 1920 through 1935 the average percent of loss to total resources of all building and loan associations was 0.12152. This period covers the depression of 1920 and 1921, the period of prosperity in the 1920's, and 4 years of major depression.

It should be kept in mind that these are figures for all the associations in the country—good, bad, and indifferent. The Federal Savings and Loan Insurance Corporation does not by any means insure all of the associations. It is very selective about the institutions which it insures and is taking only those of known solvency and with some reserves.

When an institution which has always made loans on the average man's home comes through the worst depression in history and at the end of it is of unquestioned solvency and still has a reasonable reserve position, there is no question about its high quality and future solvency. That is the kind of institution which the Insurance Corporation is insuring. It doesn't merely

blanket the savings and loan associations as the F. D. I. C. blanketed the commercial banks of the country.

Actually the Federal Deposit Insurance Corporation is taking a much greater risk in insuring bank deposits than is the Federal Savings and Loan Insurance Corporation in insuring the accounts of savings, building and loan associations. This is because the F. D. I. C. in effect insures the liquidity of commercial banks as well as their solvency. A perfectly solvent bank could be closed because of lack of liquid assets and the F. D. I. C. would be liable to its depositors, with the loss that is likely to result when even good assets must go through a forced liquidation. This insurance of liquidity will probably be as large a source of loss to the F. D. I. C. as is the insurance of solvency.

The Federal Savings and Loan Insurance Corporation insures only solvency and not liquidity. It will not become liable if one of the institutions which it has insured becomes unable to pay on demand, and accordingly there would be considerable justification for the savings and loan premium rate being even lower than that paid by banks. It should certainly be as low. Only long-run experience will give the final answer, but I would guess that half the risk involved in the F. D. I. C. comes from this insurance of liquidity in addition to insurance of solvency.

The risks assumed by the Federal Savings and Loan Insurance Corporation are being consistently lessened by the substantial increase in reserve accounts of associations throughout the United States. In the period from 1931 through 1935, for example, the surplus and undivided profits account of all associations increased from $274,000,000 to $615,000,000, an increase in that period of $341,000,000, or nearly 125 percent, and this in a period when these associations, like all financial institutions, had some losses to absorb before their reserves could be increased. It seems clear that associations of the well-managed, high-quality type which the Insurance Corporation is insuring are definitely embarked upon a policy of increasing their own reserves and thus consistently lessening the likelihood of losses to be absorbed by the Insurance Corporation.

Actually the Insurance Corporation is accumulating substantial reserves against another depression. To date I am informed that they have received in insurance premiums over $2,000,000 and their losses have been less than $1,000. With the present extent of their operations, they would have a lot of room to absorb additional losses, but their premium income is consistently increasing and there seems no probability of anything except a very negligible amount in losses for quite a long time in the future, and there seems to be no real reason why tremendous reserves should be accumulated at the expense of these institutions and the public, which saves this money in them in excess of what the requirements may reasonably be anticipated to be. This is especially true since the Insurance Corporation has the right to make an additional assessment of one-eighth of 1 percent annually against the institutions which it insures, and would continue to have the right to make an assessment of one-twelfth of 1 percent under the terms of this bill. Accordingly the Corporation could raise one-sixth of 1 percent in premiums and assessment each year under this bill, and in view of the loss record of these associations previously cited that would certainly seem adequate to take care of even more dire emergencies than were encountered in the early 1930's.

There can be reasonable difference of opinon as to what any of these rates should be, and 2 years ago the Federal Home Loan Bank Board felt that the premium rate should be one-fourth of 1 percent with the possibility of an additional assessment of one-fourth of 1 percent, or a total of one-half of 1 percent per year. It seems clear now that this original rate was entirely too excessive and the record of the Insurance Corporation to date, their selectivity in the associations which they insure, the accumulation of reserves within the associations themselves, the long term safety record of building and loan associations, as well as the present discrimination between banks and associations in favor of the banks so far as their premium rate is concerned, all suggest the advisability of amending the law to provide for the lower rate as indicated in this bill.

So far, associations holding only about 24 percent of the total savings, building and loan assets of the country have had their accounts insured. The fact that the premium rate is so high, especially as compared with that charged commercial banks, is one reason why more institutions have not insured. They feel that in view of the cooperative record of the two types of institutions they have been discriminated against.

Another reason why many institutions are not insuring is the duplication of examination and especially of cost of examinations in the case of an insured association, and section 2 of this bill is intended to correct this situation. Here again the precedent of the Federal Deposit Insurance Corporation is followed inasmuch as the F. D. I. C. absorbs the cost of any regular supervisory examination which it may make of an insured bank rather than placing this additional charge on the banking institution.

At present State chartered savings, building and loan associations are examined by their State supervisory authorities, and of course they must pay for this examination as well. In the case of many associations the cost of this additional examination made by the Insurance Corporation, plus the high premium rate for the insurance itself, mounts up so that the directors and managers have felt that the institution was not justified in taking on this additional annual financial burden.

It would be different if the examination by the Insurance Corporation was the only one for which the association had to pay, but in practically every State it must also pay for an exhaustive examination by the State supervisory authorities, and since the State authorities have primary responsibility to check into the condition and practices of the association it is quite proper that they should make such examinations. Thus the charge for the one made by the Insurance Corporation merely becomes an added burden.

This bill refers only to the ordinary examinations, it does not apply to special examinations because of defaults or anything for which the association itself is primarily responsible. If the institution's operations are such that it does require this special attention, it will continue to be charged for it.

Here again, on this matter of examination, since commercial banks do not need to pay an additional charge for regular examinations of F. D. I. C., it does seem to be discrimination to place such a charge on insured savings and loan associations.

There is no doubt that this insurance has come to stay and that the desire for it will increase as time goes on.

The uninsured association certainly will in the future have difficulty in competing with the insured one. Insurance does not guarantee earnings and in the case of building associations does not guarantee liquidity. The Federal Savings and Loan Insurance Corporation guarantees the safety of the investment plus credited earnings up to $5,000 for each investor.

If and when an association is taken over for liquidation, it protects the investor by giving him an opportunity to immediately obtain a similar account in a going institution in the same amount of his account in the closed one—the same long-term investment which he originally made with similar rights in all respects in an institution also insured. If he does not choose that alternative it gives him 10 percent in cash and the balance in debentures of the Insurance Corporation—one-half due in 1 year from the date of default and one-half due in 3 years from the date of default.

While at the present time these debentures do not bear interest, it is possible that by amendment of the act this may be changed in the future. However, the investor will not be compelled to wait until his debentures mature before he receives the money. These debentures will be readily salable and if he desires immediate cash he should have no trouble in marketing his debentures.

The financial statement of the Insurance Corporation at the close of business on June 30, 1937, showed total assets of $108,985,895.69. One hundred million dollars, which represents the capital, is invested in 3-percent H. O. L. C. bonds, which are guaranteed by the United States Government. In addition the Corporation holds as investment other H. O. L. C. bonds, also guaranteed by the United States Government, in the sum of $1,867,000 and United States Government bonds in the amount of $5,764,500. Reserve funds already provided amount to $842,000, and the net income from July 1, 1936, to same date 1937 was $1,253,845.98. Of these assets $6,000,000 are being held as special reserve for contingencies, one of which is its ultimate use in the payment of dividends to the H. O. L. C.

The present market value of the bonds held by the Insurance Corporation is actually more than $2,000,000 in excess of the figures which are carried in the report. The losses have been approximately $2,000. In the light of these facts there cannot be any question of both the financial strength and liquidity of the Insurance Corporation.

One of the chief purposes of the insurance of shares is to reestablish the confidence of the people in the savings and loan type of associations. This it has rapidly done. The Insurance Corporation has made steady and substantial progress. On July 15, 1,772 associations had been insured. One thousand, one hundred and twenty-eight of the 1,772 associations were old-established institutions. The total assets of all insured associations was $1,439,066,023 and the total number of investors protected was 1,500,977, which merely refers to individual investors and does not include the protection of the family which would probably be five times that many persons.

We may also emphasize the fact that the Federal building and loan asscciations make but one kind of loan, that is, a character loan since those who apply for loans are investigated as to their capacity to pay and their reputation in the community. The loan is also based upon the best security in the world, namely, the home.

The average normal man when he is confronted by the danger of having all of his possessions swept away will make the most determined effort to save his home. No security could be so good. We may also call attention to the fact that there is no agency in our country that has done more for the public weal and the stabilization of our institutions than the savings and loan associations which have made it possible in many sections of the Nation for our urban areas to be largely populated by home owners.

If it were not for the manner in which these institutions had assisted the people to accumulate sufficient to buy homes and had stimulated the ambition of the small wage earner to be a home owner, the character of our people would be entirely different.

The home is the great school of discipline and good citizenship. It is the strongest pillar of our Republic. It is the greatest influence against dangerous tendencies. In the happy home you will always find a spirit of law and orderly processes of government. When we consider this character of legislation we should give no little weight to the purposes it has in view—to the stimulation it will give to the building and loan associations. They should not be burdened with higher insurance rates than the banks whose character of loans is largely dependent upon the judgment, associations, or favoritism of those who administer its affairs.

While comparisons are invidious and while we are dependent upon both character of institutions, certainly without actuarial experience as to either class of insurance no discrimination should

be shown against the savings and loan associations. Those who administer the Federal Savings and Loan Insurance Corporation are opposed to this reduction, but this is but an evidence of the constant tendency of those who administer the various agencies of the Government to strive for the acquisition of more power and greater earnings, and against any favorable change to those who should be the beneficiaries of the law.

It is seldom indeed that we ever hear anyone connected with the bureaus of the Government advising that its incomes should be decreased or its powers diminished. They would like to accumulate immense reserves at the expense of the borrowers and depositors of the savings and loan associations. Any increase in the reserves of the Federal Savings and Loan Insurance Corporation above the actual requirements will entail a hardship on the patrons of the savings and loan associations, which they should not be compelled to bear.

The reaction to the bill from those who operate the insured associations has been distinctly favorable. No thoughtful man who has the interest of these institutions at heart would contend for any less premium than will insure solvency to the Federal Savings and Loan Insurance Corporation, but it is reasonable that the insured institutions should also be opposed to paying excessive premiums that will result in the accumulation of excessive useless reserves. Certainly in the light of the fact that we have no actuarial experience the building and loan associations are justified in demanding as favorable treatment as the banks receive under the Federal Deposit Insurance Corporation law.

While we have admitted we have no adequate actuarial experience in regard to the insurance of building and loan associations we can predict with reasonable assurance that under the operation of the Federal Savings and Loan Insurance Corporation, which not only furnishes adequate insurance, but also supervision and thorough periodical examinations of insured associations, failures in the future will be greatly reduced and losses much diminished.

This will not only result because of the beneficial activities of the Federal Savings and Loan Insurance Corporation, but also by reason of the faith and confidence those who deal with these associations will have because of their knowledge that their savings in the institutions are secure.

The soundness of the Federal Savings and Loan Corporation must be maintained. No action should be taken which would reduce its premium income or increase its expenses so that there would be any question about the solvency of the Corporation itself or any question about absorbing losses except through premiums or assessments paid by the insured institutions. The facts so far as they are available corroborate the belief that the premium and assessment rate can be reduced, and the regular examination costs can be absorbed by the Corporation with its financial soundness unimpaired and at the same time place it on a parity with the Federal Deposit Insurance Corporation.

South Carolina—The Palmetto State

EXTENSION OF REMARKS

OF

HON. HAMPTON P. FULMER

OF SOUTH CAROLINA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, November 30, 1937

Mr. FULMER. Mr. Speaker, I appreciate the opportunity of saying something about my State, South Carolina, at this time. We have in South Carolina wonderful natural resources and possibilities and it is my firm belief that the years will not be many before this great State will take that place in the Union that she so richly deserves financially and otherwise.

I want to call to your attention some interesting facts about the Palmetto State that you should know about with the hope that you and your people will pay us a visit and ascertain for yourself the wonderful, old-time southern hospitality that awaits you, and the great possibilities awaiting those who want to invest and spend an enjoyable life where the climate is "just wonderful" the year round.

INTERESTING FACTS

South Carolina was the eighth State to come into the Union. It was admitted May 23, 1788.

The name "Carolina" was derived from the Latin word "Carolus." The grant made by Charles I, of England, in 1629 to Sir Robert Heath was named "Carolana" in honor of the King. In 1663 Charles II gave the land, under the name of "Carolina" to eight noblemen known as the lords proprietors.

"The Palmetto State" is the nickname. It is also known as the wonderful iodine State because of the iodine in its milk, fruits, and vegetables.

The United States Census of 1930 gives the population as 1,733,765—white, 944,040; Negro, 794,725.

The State has an area of 30,495 square miles, or 19,576,800 acres.

Normal temperature for State, 63°, with 47° as normal winter temperature.

Normal rainfall varies from 45 inches along the northern coast to 61 inches in the mountainous section.

Snow is rare in many sections of the State.

South Carolina was the first State to plant rice and indigo for sale.

The first tea farm in America was at Summerville—known at present as the flower town among the pines.

The first landscaped garden in America was Middleton Garden—today a mecca for beauty lovers.

The first free library in America was started in Charleston about 1695. It was taken over by the Province of South Carolina in 1700 and any person in the Province could go to Charleston and read or withdraw the books. The library was destroyed by fire in 1840.

The first public museum in America was organized January 12, 1773. In 1915 it became the Charleston Museum.

The first ship built in America to cross the Atlantic Ocean was a light sailing vessel built by the Huguenots at Port Royal. The Huguenots used it to return to France in the winter of 1562–63.

The first steam locomotive in the United States was the "Best Friend," built for the South Carolina Railroad.

The first separate building in America for a college library was at the present University of South Carolina.

The first free schools for Negroes were founded in Charleston as early as 1740.

South Carolina was the only State in the Union whose signers of the Declaration of Independence were all natives of the State and college men, educated abroad.

The largest earthen dam in the world, for water power purposes, is located on the Saluda River 10 miles above Columbia.

The largest Carneau (pigeon farm) in the world is in Sumter.

South Carolina was the first State to secede from the Union, December 20, 1860, and the first shot of the War between the States was fired in Charleston harbor.

A unique fact about the State is that it is the only State in the Union which has no divorce law.

The kraft paper mill in Georgetown, with a capacity of more than 625 tons daily, is the largest of its kind in the world.

Six Congressional Medals of Honor were awarded to men from South Carolina for meritorious service during the World War, the largest number, based on percentage of soldiers and size of area, awarded in any State.

LEGAL HOLIDAYS IN SOUTH CAROLINA

January 1, New Year.
January 19, Lee's Birthday.
February 22, Washington's Birthday.
May 10, Confederate Memorial Day.
June 3, Jefferson Davis' Birthday.
July 4, Independence Day.
First Monday in September, Labor Day.
October, Thursday of State fair week.
First Tuesday in November, general election day.
November 11, Armistice Day.
Fourth Thursday in November, Thanksgiving Day.
December 25, Christmas Day.

STATE FLOWER—YELLOW JASMINE

The yellow jasmine was officially adopted by the general assembly February 1, 1924.

STATE BIRD

Although South Carolina has not officially designated any particular bird, the mockingbird is found in all parts of the State.

SHRUBS AND COMMON TREES

Fruit trees: Apple, cherry, fig, peach, pear, plum, and pomegranate.

Shrubs: Honeysuckle, Judas-tree, mockorange, mountain laurel, myrtle, pepper bush, redroot, wild azalea, wild olive, yellow jasmine, obelia, and nandina.

Commercial trees: Ash, bay, beech, black gum, black walnut, birch, catalpa, cedar, cherry, chestnut, cottonwood, chinquapin, cypress, dogwood, elm, hackberry, hawthorn, hickory, hemlock, holly, linden, locust, magnolia, maple, mulberry, oak, palmetto, persimmon, pine, poplar, red bud, sassafras, sourwood, sweet gum, sycamore, tulip, and willow.

THE FLAG

The South Carolina flag was designed by Col. William Moultrie in 1775 and was adopted, with the addition of the palmetto tree, as the State flag in 1777.

The background is a beautiful blue with a crescent and a palmetto tree on it. In 1775 Colonel Moultrie was defending a fort on an island near Charleston and his men wore blue uniforms with silver crescents decorating their blue caps. His design for the flag was a compliment to them.

The next year, 1776, the British attacked the fort, which was made of soft palmetto logs, on Sullivan's Island. The cannon shots, instead of passing through, sank into the soft logs and were stopped. This kept the enemy from taking the fort, and the picture of the palmetto tree was added to that of the crescent on the flag.

Fort Moultrie is named for the general who so ably defended it, and who also designed the flag.

The flag should be displayed daily, except in rainy weather, upon the statehouse, and every courthouse, and each State college, and upon the inside of every public school building except when closed for vacation. The statutes prescribe that Clemson College shall manufacture State flags and sell them at approximate cost.

STATE SONG "CAROLINA"

[Words by Timrod. Music by Anne Custis Burgess]

(Adopted by the General Assembly February 11, 1911)

Call on thy children of the hill,
Wake swamp and river, coast and rill,
Rouse all thy strength and all thy skill,
Carolina! Carolina!

Hold up the glories of thy dead;
Say how thy elder children bled,
And point to Eutaw's battle-bed,
Carolina! Carolina!

Thy skirts indeed the foe may part,
Thy robe be pierced with sword and dart,
They shall not touch thy noble heart,
Carolina! Carolina!

Throw thy bold banner to the breeze!
Front with thy ranks the threatening seas
Like thine own proud armorial trees,
Carolina! Carolina!

Girt with such wills to do and bear,
Assured in right, and mailed in prayer,
Thou wilt not bow thee to despair,
Carolina! Carolina!

[NOTE.—These five stanzas are selected from the poem "Carolina" by Henry Timrod, the laureate of the Confederacy.]

THE SWORD OF STATE

This sword hangs from the front of the senate rostrum during daily session of the senate and is carried by the sergeant at arms on all state occasions. It was made in Charles Town (Charleston) and bought May 5, 1704, for £26 11s 3d ($129).

MACE

The mace is the emblem of authority of the house of representatives. Whenever the house officially attends in the senate chamber, and upon state occasions, the mace is always borne at the head of the procession. It was made in London in 1756 and is solid silver with gold burnishing. It is possibly the only mace in use in the United States which antedates the Revolution. It was used by the commons house of assembly until the Revolution.

CONSTITUTIONAL GOVERNMENT IN SOUTH CAROLINA

Governmental authority in South Carolina is derived from a constitution which was adopted in 1895. It provides for three separate and distinct departments known as the legislative, executive, and judicial, and prohibits the exercise of powers of one department in the functions of another.

The legislative power (article 3) of the State is vested in the general assembly, which is composed of two branches known as the senate and the house of representatives. There are 124 representatives apportioned among the several counties of the State according to the population, and they are chosen by ballot every second year on Tuesday after the first Monday in November by citizens qualified to vote.

The senate is composed of one member from each county, elected in the same way as the representatives, but for a term of 4 years. Elections take place during even years, and senators are so classified that about half of their number must be chosen every 2 years; thus, the senate can never be composed of all new members.

The general assembly meets every year on the second Tuesday in January in Columbia, and the members receive a specified amount for their services extending over a period of 40 days. In more recent years the session has extended far beyond this specified time.

While it is in session the general assembly passes laws which the citizens of the State are supposed to observe for the best interests of all of the people. In order for a law to be passed or for a bill to become a law, it must be read three times and on 3 different days in each house, have the great seal of the State affixed to it, and be signed by the president of the senate and the speaker of the house of representatives. (Governor must sign unless it becomes law as specified below, over his veto or through the 3-day limit.)

The highest executive authority—article 4—of the State is the Governor, who is elected in the same way as the members of the general assembly. His term of office is for 4 years and he cannot succeed himself. A Lieutenant Governor is also elected at the same time with the Governor and if anything happens to the Governor, then he takes his place. The Lieutenant Governor is president of the senate and presides over all of its sessions.

The Governor is commander in chief of the militia of the State, except when they are called into active service of the United States. He has the power to grant pardons and commutations of sentences to prisoners, to require reports from all executive departments and boards of public institutions, to call into extra session or to adjourn the general assembly, to commission all officers of the State, to make recommendations to the legislature, to suspend public officers for reported misconduct, and to veto or sign all bills passed by the general assembly.

Whenever a bill passes the general assembly it must be presented to the Governor for his signature or his veto. If he neither signs nor vetoes it within 3 legislative days' time, it becomes law without his signature. A bill which the Governor vetoes may become law if two-thirds of the members of each house of the general assembly voting should vote in favor of passing it.

In addition to the Governor there are other executive officers elected by the people for a term of 4 years each year. They are the secretary of state, the comptroller general, the attorney general, the treasurer, the adjutant and inspector general, and the superintendent of education.

A whole article—11—of the Constitution tells about the State school system and its financial support.

The general assembly has the power to increase the duties of all these executive officers, and to establish new departments when necessary for carrying on the government's business.

Some of these departments already established include health; agriculture, commerce, and industries; highway department; tax commission; insurance commission; industrial commission; departments of game and forestry; public service commission; department of labor, and many others.

The power of the judicial department—article 5—of the State is vested in a supreme court which consists of a chief justice and four associate justices elected by the general assembly for the term of 10 years, the term of one justice expiring every 2 years so there are always experienced men serving. There is also a court of common pleas which has civil jurisdiction, and a court of general sessions which deals with criminal cases only.

The general assembly also establishes county and municipal courts which try cases of minor importance when, and if, a majority of those who are voting request it.

There are, in all, 17 articles in the constitution which give us our rights and guard our liberties. Every citizen, and that means every boy and girl, should know the organization of his government. It is the duty and the privilege of everyone to help make it better and to take advantage of, in an intelligent way, the opportunity guaranteed in article 1, section 1, which says:

All political power is vested in and derived from the people only, therefore they have the right at all times to modify their form of government.

THE CAPITAL CITY, COLUMBIA

In 1786, the State of South Carolina purchased 4 square miles of land according to an act of the general assembly for the location of the capital.

The town was then laid off in blocks so that there are exactly 10 to the mile. The streets all run parallel north and south or east and west and are 100 feet in width. Two avenues at the center are 150 feet wide. The great width of the streets lessens fire hazards, makes possible beautiful avenues of trees, and prevents traffic congestion to a great degree.

In and around Columbia are many interesting and attractive features. Among them are the rapids in the rivers which have led to enormous power developments, and textile manufacturing plants; Millwood, the boyhood home of Gen. Wade Hampton; the First Baptist Church in which the Secession Convention met December 17, 1860, organized and adjourned to Charleston; the University of South Carolina, the third State university organized in the United States and possessing the oldest college library in a separate building in the United States; the boyhood home and graves of the parents of Woodrow Wilson, America's World War President; and many beautiful old homes and gardens, as well as commodious new public buildings.

There are many educational institutions in the capital city in addition to the public schools, and the university already mentioned. They are Columbia College for Girls, Columbia Bible College, Lutheran Theological Seminary, Ursuline Convent, Epworth Orphanage, Allen University, and Benedict College for Negroes.

THE STATEHOUSE

The old statehouse, which was begun in 1786, was occupied in 1790 and used until the 17th day of February 1865, when it was destroyed by Sherman's troops. It was planned by the architect James Hoban, who later designed the White House in Washington, and was a large wooden structure. Prior to the burning of the old statehouse the legislature had made provision for the erection of a new one. For 3 years futile efforts were expended in this direction and then in 1854, Niernee, a native of Vienna, was selected as the architect for the new building. Finding both the plans and the material unsuitable, he tore down what had been done during the 3 previous years and started the present building which faces north and south across Main Street at its intersection with Senate and Gervais Streets. Wings extend to the east and west, the main floors of which furnish the large halls for the meeting of the two houses of the legislature.

The original plan called for completion within 5 years but interruptions and delays attended its construction. More than 10 years elapsed since its beginning and the burning of Columbia in 1865. The new building was not hurt during the invasion although it carries some scars made by shells from the cannon fired by the invading army. The greatest loss was in the old statehouse which was burned and with it all the valuable drawings, contracts, and plans of the new building, as well as Niernee's library of architectural and scientific books, engravings, and several thousand drawings.

At a cost approximating over $3,540,000 the building has progressed to its present proportions. The original plan, with the exception of the dome which replaces the "lofty and finely proportioned tower" supposed to rise through the center of the building, has been followed by the various contractors.

As the building now stands, it is an imposing, beautiful, and dignified Roman Corinthian style structure of granite.

IMPORTANT CITIES

Charleston, chief seaport of the Southeast and at one time the capital of the State, is a very old town, located on a fine harbor. Its history is filled with adventure and romance. In April 1670 some English settlers landed on the west bank of the Ashley River at Albemarle Point and began to build a fort and dwelling houses. The settlement was called Charles Town. Later a new site was chosen nearby on Oyster Point. Because the two rivers, the Ashley and the Cooper came together here the harbor was much better and boats could land more easily. Soon the whole settlement had moved across the river to the new site and it is the present city.

In addition to its interesting history and importance as a seaport, it has today many lovely houses and gardens. Visitors come from all parts of the world to see them.

Beaufort, at one time one of the richest towns in America, is the second oldest town in South Carolina.

The cities in the State which have a population of 5,000 or more are:

Charleston	62,265
Columbia	51,581
Greenville	29,150
Spartanburg	28,723
Florence	14,774
Anderson	14,383
Sumter	11,780
Rock Hill	11,322
Greenwood	11,020
Orangeburg	8,776
Union	7,419
Newberry	7,298
Gaffney	6,827
Aiken	6,033
Clinton	5,643
Darlington	5,556
Chester	5,528
Laurens	5,443
Camden	5,183
Georgetown	5,082
Hartsville	5,067

MOTTOES

"Animis opibusque parati" (prepared with minds and resources).

"Dum spiro, spero" (while I breathe, I hope).

CHIEF AGRICULTURAL PRODUCTS AND COMMERCIAL INDUSTRIES

Farming: Cotton, tobacco, and truck produce.
Farming.
Textile manufacturing.
Lumbering.
Hydroelectric-power production.
Fishing and marketing sea foods.
Canning foodstuffs.
Fertilizer manufacturing.

Operation of tourist hostelries.
Paper manufacturing.

Prospect of a Constitutional Peace Amendment

EXTENSION OF REMARKS

OF

HON. LOUIS LUDLOW

OF INDIANA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, November 30, 1937

RADIO ADDRESS OF HON. LOUIS LUDLOW, OF INDIANA, OVER THE COLUMBIA NETWORK NOVEMBER 29, 1937

Mr. LUDLOW. Mr. Speaker, by unanimous consent I present for publication in the RECORD the following radio address I delivered November 29:

In the opinion of the humble citizen who is addressing you, there is a very fair prospect that we shall witness before long the birth of a new constitutional amendment in the United States which will be the greatest achievement for democracy since the adoption of the Bill of Rights and which will round out and complete that immortal code of liberty. There is the most abundant and convincing evidence, supported by a great surge of public sentiment, to substantiate the belief that this new amendment is on its way.

The proposed new amendment is a peace amendment, especially designed to protect America from foreign entanglements and to keep our boys out of the slaughter pens of foreign wars.

As the author of this proposed peace amendment I beg your indulgence while I read its text to you. It proposes to insert in the Constitution the following provision:

"Except in the event of an invasion of the United States or its Territorial possessions and attack upon its citizens residing therein, the authority to declare war and to send armed forces to engage in war beyond the geographical limits of the United States shall not become effective until confirmed by a majority of all votes cast thereon in a Nation-wide referendum. Congress, when it deems a national crisis to exist, shall by concurrent resolution refer the question of war or peace to the citizens of the States, the question to be voted on being: Shall the United States declare war on ———? Congress shall otherwise by law provide for the enforcement of this section."

This constitutional amendment would give all of you who are listening to me the right to vote on the question of participating in foreign wars. Now you have no choice in the matter. When war comes you are hurled into the conflict, whether you like it or not. In America today we have a dual autocratic and popular control where popular sovereignty stops at the water's edge. In its foreign relations our Government is not a democracy but a pure autocracy. You can cast your ballot for constable or dog catcher; you can vote on the location of a pesthouse or a waterworks; but you have absolutely nothing to say about a declaration of war, the most important of all decisions, involving your most sacred rights and the lives of your loved ones. The amendment I am advocating would give you a vote on war, as well as on these relatively minor and insignificant things. The constitutional amendment I propose is based on the belief that if the people of America are given the right (which in a democracy ought to be conceded to them without question) to vote on participation in wars in other parts of the globe they will keep our boys out of foreign slaughter pens.

If this proposal to give the people a right to say whether our boys shall be sent into foreign wars is adopted by the Congress and ratified by the States, it will become the twenty-second amendment of the Constitution of the United States, but logically it should appear in that immortal document as amendment No. 11, at the close of the Bill of Rights, for the reason that it would insure to the people for all times the inestimable right which they do not now possess of being permitted to vote on declarations of war.

Let us review some of the guarantees of the Bill of Rights:

(1) Freedom of religious worship.
(2) Freedom of speech.
(3) Freedom of the press.
(4) Freedom to peaceably assemble and petition the Government for redress of grievances.
(5) Freedom from unreasonable searches and seizures.
(6) Freedom from cruel and unusual punishments.
(7) Trial by jury.

It is now proposed by my resolution to add to the Bill of Rights one more guarantee, as follows:

"No participation in foreign wars except with the consent of the people."

What could be more in harmony with the spirit and the purpose of the Bill of Rights than that the people shall have a right to say whether they shall sacrifice their sons and pour out their treasure in foreign wars? It is now time to complete the Bill of Rights by adding this proposed new amendment to the Constitution.

I believe that if it had not been for obvious and insuperable imperfections in the means of communication 150 years ago Jefferson and his compatriots would have made provision for a referendum on foreign wars in their cherished Bill of Rights. The only tenable argument ever made against the plan for a referendum on participation in foreign wars is the time required to take such a referendum, which, it is argued, would give an enemy nation the advantage.

That was a valid argument in 1837, but not in 1937.

In the early days of the Republic the railroad, the telegraph, the telephone, the radio, the airplane, were in the bosom of the unknown future. Even the pony express was as yet undreamed of. Letters mailed on the eastern seaboard were 6 months reaching the uttermost frontiers, if indeed they ever reached there at all. Now it is all different. The fast train roars its way across the continent in 100 hours, the airplane in 24. Sitting before a microphone in Washington the President talks to the entire Nation. Is it not plain that the only real objection ever made against a referendum on foreign wars, namely, that it would consume too much time, has been completely nullified by modern perfection in the means of communication?

The constitutional amendment I propose is based on the philosophy that those who have to suffer and, if need be, to die and to bear the awful burdens and griefs of war and to bind themselves and their children and their children's children with a century of unremitting toil to pay the costs of war, shall have something to say as to whether war shall be declared. What could be more elementally just than that? My proposed constitutional amendment would not impair our national defense in any way, in any sense, or in any degree. In the event America is attacked or invaded, the referendum would not apply.

A declaration of war is no idle and inconsequential thing. It signs the death warrant of our fine young manhood. Surely it is a matter of sufficient importance to entrust to the decision of all of our people, with women having equal voting rights with men, as is proposed in my resolution.

And why should not women have the right to vote on a declaration of war? War is the supreme calamity affecting family ties. It breaks up happy homes and tears heartstrings asunder. Women go down into the valley of the shadow of death to bring our boys into the world. Why should not they have something to say as to whether their flesh and blood shall be hurled into the hell of a foreign conflict? In every war, terrible as is the fate that awaits many men, women, I believe, are the worst sufferers. Of the 531 Members of Congress only 7 at this time are women, so you see, with the war power vested in Congress, how pathetically negligible and impotent is the opportunity afforded to give expression to whatever may be women's viewpoint on any particular war proposal. I would think that the women of America, who, after long and painful effort have acquired the right of suffrage, would arise in their might and demand a vote on war.

It would have to be a mighty good cause that would drag America into war under this constitutional provision. I believe it would keep us out of all foreign wars and, indeed, out of all wars, unless occasion might arise to wage a righteous war of defense, which is highly improbable. We are not a nation of aggressors, and the chances that some foreign power will come to our shores and attack us are about as remote as the probability that the moon will suddenly jump from its orbit and land on top of us. We will never have security from war and the awful fear of war in this country until the war power is democratized and vested with the people. That is where it ought to be, for that is where sovereignty abides.

America has lost confidence in the ability of diplomats to keep us out of war. When the war power is transferred to the people who have to do the dying and the suffering, we may look forward to an unbroken era of peace and freedom from foreign wars, when America may bind up the wounds of the last war and establish itself as an exemplar of righteousness among the nations of the earth. To promote the coming of this era of peace and good will is the purpose of the proposed twenty-second amendment of the Constitution.

One hundred and ninety-four Members of Congress, representing more than 50,000,000 American citizens, have signed a petition now at the Speaker's desk to bring my peace amendment before the House for a vote. The congressional delegations from 15 States have signed the petition solidly, and 40 of the 48 States are represented among the signers. The American War Mothers, whose sons sleep in France, are asking Congress to pass my proposal, so that—and I quote their language—"the women of the future may never know the anguish that has been theirs." A million workingmen, comprising the 21 railroad brotherhoods, are giving it valiant support. Countless thousands of parents and teachers and school children—the potential cannon fodder of the future—are urging it. The organizations supporting it—religious, educational, social, and fraternal—are innumerable. They see in it the one great hope to escape involvement in threatened war at a time when both the Occident and the Orient are aflame and we are likely to be dragged in at any moment.

In recent visits to universities in Ohio, Indiana, and other States I saw before me many fine young men whose faces bore the imprint of character and high resolve who desire under all circumstances to do their duty as God gives them to see their duty, and I think I know what they are thinking. I think they are thinking that they love their country and that they would pour out the last drop of their blood, if necessary, to defend it from attack or invasion, but they are resenting, just as I resent the idea, that if the world war, which seems to be imminent, comes, they will be conscripted and sent away to distant countries to die in foreign shambles. Such a thing will never happen if the people of America acquire the right to vote on a declaration of war.

The peace amendment to keep America out of foreign wars is more than a hope. It is a very definite prospect, but a great deal of hard work remains to be done to make it a reality. Only 24 more signatures of Members of Congress are required to bring the peace amendment before the House for a vote. You who are listening in can render the greatest service for peace you will ever have the opportunity to render if you will help to get those 24 signatures. I firmly believe that if my peace amendment is brought up for consideration in Congress it will pass, and that when it goes to the States it will be ratified, and that this new twenty-second amendment of the Constitution will make America a safer place for our children and our children's children and will stabilize through all the years to come the peace and security of our country.

Religious and Ethical Basis of the Rights of Labor—Economic Factors—The Movement, Not Organizations, Is the Important Thing

EXTENSION OF REMARKS

OF

HON. MAURY MAVERICK

OF TEXAS

IN THE HOUSE OF REPRESENTATIVES

Tuesday, November 30, 1937

SPEECH BY HON. MAURY MAVERICK, OF TEXAS, BEFORE A MEETING OF MACHINISTS' UNION, LABOR TEMPLE, SAN ANTONIO, TEX., SEPTEMBER 21, 1937

RELIGIOUS AND ETHICAL BASIS, RIGHTS OF LABOR

Mr. MAVERICK. Mr. Speaker, leaving Congress last session, we traveled on down to San Antonio, and when I arrived, there was much discussion among the labor groups of the C. I. O. and the American Federation of Labor. There was some misunderstanding, but no ill feeling whatever of individual members of labor organizations as against members of other organizations.

However, I determined to make a report to the labor organizations on conditions as I saw them. I spoke at the Labor Temple, headquarters of the American Federation of Labor, and frankly stated that I favored all labor organizations, the C. I. O. as well as the A. F. of L. and the four brotherhoods. The reaction was good. After discussing the matter with numerous members of organized labor, I concluded that the rank and file of the labor movement want the labor movement to succeed and want the C. I. O. and A. F. of L. to get together.

A stenographic copy of the speech that I made is as follows:

LABOR PROBLEMS FROM THE SUPREME COURT ON DOWN

Friends and fellow Americans, it is my pleasure to talk to you on the various aspects of the American scene. You are either members of a labor organization, or sympathizers with the movement. A majority of you belong to the Machinists Union, a high type of craft union in which skill, training, and intelligence is essential. To your organization and to any other labor organization, I offer my cooperation.

I shall divide my talk into several heads, and among them I shall speak to you about civil and religious liberty, the moral, ethical, and religious basis of the rights of labor; the actual labor movement today in America; economic aspects; and then I shall speak of what I call the new America, and legislation to be considered in the next session of Congress.

CIVIL AND RELIGIOUS LIBERTIES BASIS OF DEMOCRATIC GOVERNMENT

We must first understand that civil and religious liberties are the basis of our Government, and of any democratic government. We have recently been observing the one hundred and fiftieth anniversary of the Constitution of the United States. I shall only discuss that phase of the Constitution which deals with civil and religious liberty and the right of assembly.

The Constitution signed in Philadelphia in 1787 was adopted as an instrument of security for business, property, and life, and did not contain a Bill of Rights. Immediately after, however, a big cry went up for this Bill of Rights, and soon 10 amendments were adopted, and of which the first deals with civil and religious liberties.

It is not very long, and I shall take occasion now to read it to you in full:

"Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances."

Civil liberty is very simple. The Constitution grants this liberty to everyone. Some say radicals, Fascists, Communists, members of the Worker's Alliance—and sometimes, the C. I. O. [laughter]—should be denied these liberties. Of course we know, as all real Americans know, that is wrong. What distinguishes us from Fascist and Communist and other dictator countries is that we guarantee liberty to everyone, and that is the only way in which all of us can preserve it.

Remember, if we deny liberty to others, we will surely lose our own liberty. And using a thought from the Bible, it might be said that he who lives by the sword—or modern violence—will perish in the same manner.

RELIGIOUS, ETHICAL, AND MORAL BASIS OF THE RIGHTS OF LABOR

There is, my friends, a religious, ethical, and moral basis of the rights of labor. These rights have developed through the ages until now by experience and time every single church in America, and of course, of every Christian church in the world, not only recognizes but proclaims and demands the rights of labor.

Let us read, for instance, what the Quakers say in the World Conference recently held in Swarthmore, Pa. You know the Quakers are a simple people, believing in peace and justice.

He is what they say:

"Payment of unemployment benefits should be as legitimate a charge against the receipts of business as is the payment of dividends to absentee stockholders," the report holds.

"There is no valid reason why the Red Cross or the Community Chest should be required to support industrial workers when new machinery is installed or during seasons of slack employment."

"Capital needs to be protected from its own greed or shortsightedness. In the long run, the upper tenth of our population cannot be secure in prosperity with 60 percent of the population living on incomes below the poverty line."

This statement is made by a very conservative and reasonable people after much thought. Had I said this myself, or had any member of the labor organizations said it, we would probaby have been charged with being "radical."

POPE PIUS XI—CONDITIONS NEED "A RADICAL AND SPEEDY REFORM"

And speaking of radicalism, there are many documents of the Roman Catholic Church whose thoughts, if followed, might forestall this same radicalism. It would be wise for all persons to read the encyclical of Pope Pius XI, entitled, "On the Reconstruction of the Social Order," wherein he said that solid Christians had come to the conclusion that harsh conditions "needed a radical and speedy reform."

This remarkable document speaks of people "who are isolated and helpless, surrendered to the hard-heartedness of employers, and the greed of unchecked competition." These words were quoted from an encyclical 40 years before by Leo XIII, and which are repeated in the latest encyclical. Organization, collective bargaining, are specifically recognized. The expansion of modern industry, and the "sacred rights of the workingmen" are referred to, and laws are specifically approved concerning "the soul, the health, the strength, the housing, workshops, wages, dangerous employment," and there is added "with particular regard to women and children."

One of the important parts of this encyclical indicates the working classes must learn "to defend their temporal rights and interests energetically and efficiently," but states that they should have due respect for justice and a sincere desire to cooperate with other classes, meaning, of course, business and commercial classes.

Not alone does this encyclical approve of labor organizations but also approves of farmers' organizations, hoping that they will "combine economic advantages with mental culture."

ENCYCLICAL—"TWOFOLD CHARACTER OF OWNERSHIP"

Of great importance is the fact that in this encyclical reference is made to the "twofold character of ownership," which is described as individual and social, being for the person's "own advantage, but also for the common good." Then it said specifically "to define in detail these duties when the need occurs and when the natural law does not do so is the function of the government."

The encyclical says specifically that land, and, of course, property, can only be owned when used in harmony with the interest of the public good. It is effectively explained that unless justice is given with energy and without delay that "the tranquility of human society" cannot "be effectively defended against the forces of revolution."

This encyclical is reaffirmed in the recent joint pastoral letter of the Catholic bishops of the province of San Antonio, which covers Oklahoma and Texas. In that document collective bargaining is specifically recognized as a Christian right. There are other Catholic documents, such as one known as Organized Social Justice, printed by the Social Action Department of the National Catholic Welfare Conference. It, too, reaffirms the rights of labor and says, "the right of a family living wage is a fundamental of Catholic social teaching."

CHURCHES OF CHRIST OBSERVE RIGHTS OF LABOR

The Federal Council of the Churches of Christ, composing practically every Protestant Church in America, have said the same thing in slightly different language. They too approve the rights of labor, protective social legislation and collective bargaining.

In this we must not forget that the Government of the United States has lately taken the same stand as of all the churches. More, the laws have been specifically written and adopted.

Belatedly, but nevertheless surely, the Supreme Court of the United States has also approved these laws.

So every interest, religious and civil, approve of the rights of labor in the manner I have explained.

SOME INDUSTRIALISTS SET THEMSELVES ABOVE GOD

Now, my friends, this is no time for personalities, but as you know, there are many employers, and some very large ones, who consider themselves entirely above the law of both man and God. In spite of the authorities I have quoted you, they set themselves as superior to legal, moral, and ethical law. In the encyclical of the Pope, it is said: "These men either slander a doctrine of which they are entirely ignorant," or are "open to the charge of base injustice and ingratitude."

My friends, I therefore say to you that from every viewpoint, even of financial profit, which I shall prove later on—from every viewpoint, the church or the state, common sense or decency, organization is the proper thing for the American people. [Applause.] I therefore urge all persons, whatever their station of life, to proceed upon the principle that to organize is not only in itself legal and just, not only the proper thing to do for the individual, but the unselfish thing to do, for the preservation of human rights. [Applause.]

THE LABOR MOVEMENT IN AMERICA TODAY

I shall now discuss frankly the labor movement in America today. There is, they say, great division in labor. Insofar as the rank and file of the American people are concerned, this is not true. [Applause.] Stick together! I have spoken to laboring people all over the eastern part of the United States, near great factories, and those who work in small places, the building trades and in the mass industries, and I find working people have a greater feeling of justice for each other and the necessity for organization than has ever been had before.

I shall frankly restate to you that I am for any labor organization which dominates a particular field and serves justly the members of that particular craft or industry. For that reason I definitely approve of all labor organizations, and when I say "all," I mean all of them; and that means the American Federation of Labor, of which you are members; the Committee for Industrial Organization [applause]; and the rail brotherhoods. [Applause.] If there are any more, I am in favor of them, too. [Laughter.]

Let us review the charge that labor has suffered by the recent controversy. About 16 months ago there were around 3,000,000 organized workers. Today the American Federation of Labor has more than 3,500,000 members, and the C. I. O. also has more than 3,500,000. This means that the movement has grown from around 3,000,000 to 7,000,000; at the same time the rail brotherhoods have increased in power and strength, have put more men to work, and have obtained wage increases without violence or bloodshed. The rail brotherhoods have approximately 300,000 members. Therefore there are between seven and a half and eight million organized workers in the United States.

C. I. O. VIOLENT?—SEVENTEEN MEMBERS KILLED, NO POLICE

Now, I understand some have said that it is very bad that I am not unfriendly to the C. I. O. My answer is that as a Congressman I play no favorites, but as a matter of legal and moral principle I favor the labor movement. But, someone says, the C. I. O. is a violent organization. Oh, let us review what has happened in the last few months. Seventeen members of that organization have been killed by the police; a great majority have been shot in the back.

C. I. O. members have killed no one.

The United Mine Workers of America, affiliated with the C. I. O., have a record of having never broken a contract. The Amalgamated Clothing Workers have the same record, and not only that, but a record that they have never put an employer in bankruptcy. The same is true of the International Ladies' Garment Workers.

Now, my friends, I can serve labor, not by being a cotton-mouthed demagogue, catering alone to local political machines and local prejudices, but by developing national friendships and some influence. Would you ask me to favor the American Federation of Labor where they had no organization and there was only a C. I. O. unit as, for instance, in mining? Or favor the machinists' organization for railroad engineers, when there is already Big Four? I would not favor the C. I. O. taking over your jurisdiction. In any event, I announce as my policy the encouragement of the labor movement and humanity as such, and not as being herded into organizations.

JOHN LEWIS, WILLIAM GREEN, AND A. F. WHITNEY

Now permit me to mention three personalities: John Lewis, William Green, and A. F. Whitney. Mr. Whitney has definitely approved of the attitude which I have expressed, and which he has mentioned in the Railroad Trainmen's Journal by printing in full one of my speeches, and also by printing a long editorial in praise of that.

As to William Green and John Lewis, let this be known: That the craft movement would have occurred when it did and that the industrial movement would have occurred when it did, whether John Lewis or William Green had been born or not. The personalities of Lewis, Green, and Whitney ought not to be the dominating factor of what we should do.

The question is, What are the rights of labor, what does the labor movement mean?

To you I say, Develop no ill feeling, let there be peace, and eventually there shall be one great labor organization and movement in the United States of America [applause], and I look forward confidently to that day.

ECONOMIC ASPECTS OF THE LABOR MOVEMENT

I now wish to mention the economic aspects of the situation. Every laboring man in this country desires a decent standard of living. For that reason, I believe that the new labor organization should organize itself just as a business. More, that they should be students of economics and government, and continuously educate themselves on affairs in America today.

You must let the businessman understand that if we have underpaid workers that their lack of purchasing power will make it impossible to maintain stability of business. Also if the health, the morals, and the character of the workers are low they will affect not only business but the life of those who control this business as well.

Locally, we must meet this very situation. We have nearly a hundred thousand persons who are underprivileged, who live in one of the biggest slums in America. As a result they have tuberculosis, syphilis, and other diseases, and bad conditions. All of this has its effect upon the rest of the population. More, it is a dead financial expense to the rest of the people of our city.

Therefore the labor unions, as well as any organization, must have as their duty the study of the functions of the State and the welfare of the people. It is our patriotic duty to demand a stable and just economic structure.

THE NEW AMERICA—NATIONAL VIEWPOINT

Now, my friends, like you, I dream of a new America. We have been a great nation in the past because, migrating to this mighty continent with unlimited natural resources, we had the opportunity to build and grow great. But, my friends, we have wasted with a prodigality that has never occurred in the history of nations of the world.

Two hundred million agricultural acres are either destroyed or in the process of destruction.

There has been vast waste of our forests, minerals, and waters.

Hence, in this new America we must think of this country as our own, and because rivers and creeks care nothing for State lines we must think upon these things from a national viewpoint and not altogether from the local viewpoint.

DEMOCRACY IN AMERICA—ROOSEVELT GREAT LEADER

Now, let me speak of democracy in America. And when I say democracy I mean the forces of the American people to bring better conditions for themselves and their children. I say, and I hope not with vulgar partisanship, Franklin D. Roosevelt is the true and honest friend of the American people. [Applause.] He is not only a man who is a good leader, but he also understands the economic processes of this country, and is intelligently working for the economic good. In the last Congress he was betrayed by some of his own people in his own party. [Boos.] I believe that it is the duty of the American people to repudiate these men in order that the great reforms that he and the party have attempted may be carried out. [Applause.]

LEGISLATION IN THE NEXT SESSION OF CONGRESS

I shall, therefore, briefly mention legislation in the next session of Congress. First of all, the minimum wages and maximum hours bill should be enacted. I say to you frankly that it will not directly benefit you of the highly skilled trades. Every man in this audience obtains above the minimum wages which this bill will properly give.

But as I said to you, there are nearly eight million organized workers in this country and the rest of them are completely unorganized, and as far as that is concerned, disorganized. When we think of the millions of Americans who are receiving much less than $10 per week—men who have families, widows who have children to rear—then we should bow our heads in shame. And, indeed, from a selfish viewpoint, the skilled workers of America want the masses of the people to obtain good wages in order that their constantly depreciating standards will not depreciate those of the skilled classes. The slum conditions here in San Antonio are an example. We have such large classes of disorganized workers that they are constantly depreciating not only the standards of the skilled workers of this city but are depreciating the profits of the businessman.

There is other labor legislation, the details of which are too complicated to explain tonight. But when this legislation is considered, it should be in the light of justice, the authorities of which I read you tonight.

LABOR ORGANIZATIONS SHOULD PRESERVE RIGHTS OF FARMER

Every labor organization should have as a part of its platform the preservation of the rights of the farmer. [Applause.] Everything, after all, comes from the earth, to which everything will return.

The farmer must obtain decent prices for his products. [Applause.]

As a matter of justice and economic common sense, every member of labor should be in favor of a fair agricultural bill at the next session of Congress. But let me mention common-sense politics, too. If the laborer loses the support of the farmer, then the average people of America will be divided; then labor will also lose its rights. [Cries from the audience: "You're right."] Therefore, both from a selfish and unselfish viewpoint, labor should support agriculture.

I mentioned to you a moment ago some points about the matter of conservation. There are several bills which are of great importance to the American people. One of the most important is the one known as the seven-T. V. A. bill.

The present T. V. A. is a great success. On that project the standard of living of some 2,000,000 people has been raised somewhat, and several hundred thousand have been raised directly. On these projects the work was done reasonably and fairly, and good prevailing wages were paid those who worked on them.

The development of our natural resources and their protection, flood control, reforestation, navigation, and the production of power must be developed by the Federal Government as advocated by the President of the United States.

THE SUPREME COURT CONTROVERSY HAS DONE GOOD

Now, my friends, I have no time to discuss the recent Supreme Court controversy. Whether you believe in what Mr. Roosevelt advocated or not, the truth remains that the only reason you now have the right of collective bargaining established legally is on account of his suggestion. Minimum wages, the right of collective bargaining, and a half dozen other important rights of our citizens were impossible of adjustment on account of previous Supreme Court decisions. Then Roosevelt made his suggestion for the enlargement of the Court, and the Court reversed themselves, thereby establishing these rights.

Year after year the Court had denied the rights of labor. So the President has made a great contribution to the American people by this controversy.

Now, the questions concerning the Supreme Court, I must frankly tell you, are not well understood by the American people. All the enemies of progress, all the enemies of Roosevelt, as soon as he suggested the reform of the judiciary, used that as an excuse to defeat every other progressive measure.

The Democratic Rules Committee has defeated minimum-wage legislation, or has refused to even permit the members of their own party to vote on it. The Judiciary Committee in the House of Representatives did not even have a hearing on the Supreme Court bill.

What was the result? The result was that at the last session of Congress not very much good legislation was adopted, except that of housing and a few other bills. The important legislation was laid by the side. So you, as free-born Americans should demand at the next session of Congress that we proceed to carry out the Democratic platform and our duties to the American people, and that we do not bow our heads to reactionary lawyers, newspapers, the Liberty League, the National Chamber of Commerce, and the National Manufacturers' Association.

My friends, I think you very much indeed for listening to me tonight. Here on this roof it seems prettier, brighter, in the starry night of Texas. This may only be fancy, but it is a pleasure for me to be home, to shake hands with you, and to get your opinions on various matters. I was elected with certain pledges. I have kept those pledges. [Applause.] I have been criticized for sticking to principles and not to individual persons. My idea is that we American people with brains enough to be for ourselves, with heart enough to favor the rights of others, and backbone enough to fight ought to march forward courageously, intelligently, and patriotically. [Applause.]

Dominant Ideas of the Constitution

EXTENSION OF REMARKS

OF

HON. DAVID I. WALSH

OF MASSACHUSETTS

IN THE SENATE OF THE UNITED STATES

Wednesday, December 1 (legislative day of Tuesday, November 16), 1937

ADDRESS BY HON. JOSIAH W. BAILEY, OF NORTH CAROLINA, TO THE ECONOMIC CLUB OF WORCESTER, MASS., NOVEMBER 1, 1937

Mr. WALSH. Mr. President, I ask unanimous consent to have printed in the RECORD an able and most informative address entitled "Dominant Ideas of the Constitution," delivered by the senior Senator from North Carolina [Mr. BAILEY] before the Economic Club at Worcester, Mass., on November 1, 1937.

There being no objection, the address was ordered to be printed in the RECORD as follows:

We are celebrating, under extraordinary circumstances, the one hundred and fiftieth anniversary of the signing of our Constitution. Heretofore it has sufficed to rejoice in it and extol it. But this anniversary finds it under attack and distrusted by alarming numbers of our citizens. It is necessary now, for the first time in our history, to explain it, to advocate it, and even to defend it.

In the first hundred years we debated about its terms, but we sustained the Constitution as the charter of our Government and the bulwark of the rights of the people. Both sides in the Civil War upheld it, and under it they were reunited. But now we are informed that it is out of date and inadequate, and important men demand either that it shall mean whatever the Congress wills it to mean, and so be brought to nothing, or that it be interpreted by the courts according to the election returns, and so be rendered impotent. There is a large school declaring that the will of a majority in an election, concerning the powers of government, shall prevail against the historic will of States and people as to such powers as declared in the Constitution—not the will of the people under the Constitution by amendment duly submitted but regardless of the Constitution, and in response to political demand or alleged economic reforms, or in response to millennialistic promises. The Constitution intended to stabilize our civilization in every emergency is proposed to be subordinated to the agitations of any election.

Heretofore the Constitution has been presumed to be written into the platform of any political party and into the personal platform of every candidate for office and no party or official has dared to attack it. But now there is important demand that regard for the Constitution be cast aside even that the official oath to support and defend it be violated in behalf of momentarily popular legislation; that doubts be resolved against it; and even that it shall be interpreted politically or economically rather than judicially.

Heretofore, whenever the Constitution was considered insufficient, demand has been made for amendment in the way provided by the Constitution. But now we are informed that that method is too slow or that it cannot be relied upon; that we must have action "now," constitutional or unconstitutional; and we are urged to alter or amend the instrument of the national life by compelling the courts to interpret it as may be demanded from time to time by President and Congress. We must change its meaning by selecting judges who will do so. The restraining sense of constitutional morality is flagrantly defied. Heretofore the oath to support the Constitution has been understood to bind a public officer to accept the Court's interpretation, but now it is proposed, even by such officers, to fix the Court.

Thomas Jefferson proposed three tests of any candidate for office: (1) Is he honest? (2) Is he capable? (3) Does he believe in the Constitution? All these have been discarded by millions for only one test: What does he promise us? So the national interest is sacrificed to group interest; even to personal interest and ambition.

If this disease of our national life—this political contagion, as indicated by the symptoms which I have described and which are matters now of common knowledge—is permitted to spread, the Constitution will be destroyed and, with it, liberty and union will depart. There will be no Republic of the United States such as we have known these 150 years. What in its stead we will have remains to be seen. One may look across the Atlantic for the model.

Our question then in this year of celebration is, What may be done to restore our Constitution to its necessary place in the hearts of the American people? What may we do to preserve to them liberty and union—their Republic of free men? What may we do to preserve to ourselves and our posterity the blessings which we as Americans have enjoyed for a century and a half? These are not the gestures of alarmists, but issues pressed upon us from all directions day by day.

On the occasion of the one hundredth anniversary of the Constitution, Guizot, the French historian, asked James Russell Lowell how long the Constitution would last. Our poet and political philosopher answered, "So long as the ideas of the men who made it continue dominant." Profoundly and absolutely true.

The Constitution is no stronger than the convictions and aspirations of the people of the United States. It will be discarded whenever the American people cease to hold precious the ideas which it embodies. It gets us nowhere to talk of it as sacred, however sacred it may be.

I proceed, therefore, with no intention of merely extolling the Constitution on this occasion. We must preach now a crusade to convince our generation, and the next, of its meaning and of the value of that meaning to them as individuals and as the collective mass constituting the living Republic of the United States. I propose that this shall be the whole tenor of this celebration of the one hundred and fiftieth anniversary of our Constitution. I propose it to the National Commission in charge of this celebration and to all who love this Republic. I propose it as the most important task since the Civil War.

What, then, were the dominant ideas in the American people creating the Constitution? What has been the value of those ideas as maintained and advanced these 150 years? What is their value now? What will be their value to our children? What is the nature of the modern attack and what is the defense? These questions are the source of my message. I propose to answer them.

1. What were the ideas that produced the Constitution of the United States? What was the demand that brought it forth?

The demand was for union, a more perfect union in place of the federation that, after the Revolution, had failed. The newly won domain could not be defended, could not maintain domestic peace, could not thrive, could not be governed under 13 separate sovereignties. The people could not cooperate because there were no standards of cooperation.

Held together by George Washington and the common aspiration for independence so long as the pressure of war lasted, the United States promptly went to pieces with victory. Read your histories. Washington himself thought that all the fruits of his glorious leadership were to be lost. He declared, "Something must be done or the fabric will fall; it is certainly tottering." A Member of the Congress wrote to him of the rebellion and demoralization in this State of Massachusetts, and he replied:

"You talk, my good sir, of employing influence to appease the present tumults in Massachusetts. I know not where that influence is to be found; nor, if attainable, that it would be a proper remedy for these disorders. Influence is not government. Let us have a government by which our lives, liberties, and properties will be secured, or let us know the worst at once."

So the first function of the Constitution was the creation of the Federal Union, and the dominant and permanent function of that instrument is to preserve that Union, to the end that there shall

be government in the United States in the form of a republic. Washington's concept of government was in terms of maintaining order, not in terms of a gift enterprise nor of retreats before agitators or tubs to political whales, but in terms of equal laws to be obeyed, and, if not obeyed, to be enforced.

And those who would impair or strike down that Constitution would impair or strike down government in the Republic itself, however innocent they may be of such intention. For the Constitution is the soul of the Government of this Republic. Strike it down and you must find a new national soul and a new framework of government for 130,000,000 of people.

But Washington's sentence in this letter expressed the necessity for more than union and government. Hear his words once again:

"Let us have a government, by which our lives, liberties, and properties will be secured; or let us know the worst at once."

It follows that the heart of the problem in framing the Constitution was to establish a government that would govern consistently, not only with the preservation of the safety, but also with the preservation of the liberties and properties of the people.

And what were their "liberties and properties" in the popular conception at the time?

For what was the Revolution fought? The answer is clear—the one universal and constant motive sustaining it was the demand for the liberty of local self-government. It was not the tax on tea, nor was it the aspiration for independence. It was the conflict with the King and the Parliament of England, who insisted upon their power to govern the local affairs of the people of America and upon their powers to repeal the acts adopted here, both local and general. As against remote control the Revolution raised the standard of local self-government. The cardinal principle and grand objective of the Constitution is, therefore, Federal union with local self-government. To the Federal Union were committed only those subjects of such manifest national import and concern as to demand Federal action and uniformity—as the national defense, the regulation of the currency, commerce among the States and with foreign countries, the inviolability of contracts, and the relation of the States with one another and with the whole Union. All the rest of the functions of government, the police or social power, the functions of public education and public health, the regulation of personal activities, the repression of crime, the management of social and racial relationships, were reserved to the States and to the people. The purpose was that the people might govern in their domestic, local, and regional concerns, and move as one in all others.

This brings us to a present pressing question: The whole of the current attack upon the Constitution and the Supreme Court is directed toward the destruction of this principle of local self-government, the principle and the root of the Constitution. And we must now face the issue of sustaining or abandoning once and for all this principle. For control by London we are now threatened with the substitution of control by Washington.

The significant words in the statement of Washington is "our liberties."

"Let us have a government by which * * * our liberties will be secured."

In the minds of the men of the Revolution local self-government was the sufficient and only necessary means of preserving their liberties, and their properties, their farms, and firesides. They had fought with this in their hearts. They knew they could control local government. They did not desire a central government—they had had enough of government from afar. The Union was accepted only as a last resort, and then on condition; accepting it, they were resolved upon nothing so unanimously as upon the preservation of their rights to manage their local affairs in the interest of their liberties. Hamilton, who advocated a strong central government—but to no such extent as it is advocated today—lost his standing in the Convention and left it. Not one State would have ratified the Constitution without the understanding that the Federal Union should have only the powers granted therein; and North Carolina would not ratify until this was expressly included in the instrument.

The problem of reconciling the necessary Federal Union with the demand for local self-government in the interest of preserving our liberties was the problem of the times, of the Convention, of the State conventions, and of the people. Union was necessary, liberty was indispensable—the whole prize of the Revolution and the new government; and local self-government meant liberty—it was both a liberty and the means of preserving the liberties of men.

What were those liberties? What did Washington mean by "our liberties?"

If you are in doubt as to that meaning, if you desire specification in terms that leave no doubt, read the Bill of Rights, the first 10 amendments to the Constitution, omitted from the original, as Washington himself declared, only because it was understood by the Convention that the Constitution limiting the Federal powers as it did, made specifications and express reservation unnecessary; and which were added only as further assurance in deference to jealous popular demand. Read the express limitations upon the powers of the Congress. And by all means read also the bill of rights of any of the original 13 States. These are the charters of American liberty, these are the specifications of the rights of men as conceived by the generation that produced our Republic—these are the solemn muniments of civil liberty which that generation conceived a government must recognize in order to be worthy of existence. Little did they dream that the mighty power they were calling into existence might some day be used to destroy or in the slightest measure to impair those rights, the possession of free men for centuries, and the dynamic of the great declaration under which they had fought and won the American Revolution. Whatever may be the doubts now as to the meaning of the Constitution, the Convention, the Congress, the ratifying States had no doubts whatever on this point—the Constitution would secure for all time the blessings of liberty.

These were the rights conceived to be inherent in man as man, derived from his Creator and not to be encroached upon by any earthly power whatsoever. They were not only reserved in the people, they were set out in terms as conditions precedent to the Constitution and the creation of the Republic or of any State. They were derived from and founded upon the dignity of man as man—God's special creature.

Those liberties were the ancient liberties of the English-speaking people, the rights of the common law: The right of personal liberty, the right of personal security, the right of personal property, plus two others—the right to vote and the right to worship God according to the dictates of one's conscience. All five are contained in the one word "liberty," and without any one of them liberty is not complete, indeed is not secure. They include the right to go and come, to have your own business, to choose your course, to have a hearing upon indictment, to worship according to your will, to have judicial inquiry made at once if arrested or imprisoned, to own property, to defend your home, to control your children and their education, to a fair trial before a jury according to law and in a free and open court, not to be compelled to testify against yourself, freedom of public assembly, a free press and freedom of speech—each and all the most precious possessions of the human species.

Sometimes it is said that the framers of the Constitution placed emphasis upon property rights at the expense of human rights. There is nothing whatever in the accusation. Re-read the list—each is a personal right. The right of property is an indispensable incident of liberty. If you may take my property at will, you may deprive me of all my liberty at will, and I become your slave. The authors did affirm that no man should be deprived by the Federal Government of his life, liberty, or property without due process of law, i. e., under equal and reasonable laws justly and openly administered. Later the Constitution was amended to extend a similar prohibition to each State. And why was property included? For the manifest reason that the tyrannical power to deprive one of the fruits of his labor would make his labor worthless, his life a slave's life, and his liberty a mere mockery. And this is why Washington spoke as he did of our "liberties and properties." They go together. What would liberty be worth if one's property could be taken from him as fast as he made it? This was precisely the condition of slavery in the South.

Such were the dominant ideas of the Constitution. To guarantee them another was necessary—a framework of government unlike any other in all history, unlike any other because it was conceived and directed not just to respect those ideas, but created subject to them and so ordered as to preserve and not impair them.

To express limitations the framers proceeded to add a subservient framework of government, a govenment of laws and not of men.

Accordingly the Constitution is an extraordinary system of powers and restraints, of balances and checks, of grants and reservations. One might liken it to a great bridge, so balanced as to correct strain, so united that each part aids the whole, at one point pressing upon the structure, at another holding it up, and altogether maintaining the purpose—government, union, and liberty.

It provided three independent but coordinate branches of the Government, executive, legislative, and judicial, vesting in each respectively its functions, to perform, to frame policy, to do justice and judicially maintain the balance of powers. It provided for the independent functions of the States, and a Senate to represent them in the national council; and for the people in their localities with Representatives to speak for them in the Congress. And it provided no less for the preservation of the ultimate power of the governed in the means not only of electing public servants, but also in the means, solely reserved to them, of altering their Constitution. The vesting of governing powers in three independent but coordinate branches, the limitations of general power, the specification of particular powers, and the reservations of power to the States and the people, constituted the new order of the ages, to which the young Republic was dedicated. To bear testimony to the character of the new institution, we engraved upon the great seal of the Union two inscriptions—E Pluribus Unum, on the face, and Novus Ordo Seclorum, on the reverse—"One of many"; "A new order of the ages."

And so we erected for the first time in human experience a government of laws, not of men; a government under a constitution, binding the governing and the governed; a government of equality under law, in which neither President nor Congress, vast majority nor mighty influence, could deprive a minority or even the lowliest human being within its border of any of the rights of man. For the first time the founders of our Government placed each man in his proper place with respect to the governing power.

The Constitution is the guaranty, therefore, not only against the tyranny of one or a group, but of all together—it is the absolute guaranty against all tyranny whatsoever, and no less against personal or class privilege, sectional favoritism, or group advantage.

Our Republic and its Constitution embody the ideal of lawmaking not just for order but also for liberty—and it is acknowledged to be the ultimate institution of ordered liberty.

It must be recognized that any substantial alteration in our constitutional system will be at the expense of those liberties of men

which in the founding of the Republic and for more than 140 years thereafter have been considered of paramount importance. I mean to say that the modern attack must of necessity be upon that principle of liberty which brought forth the Republic and which the Republic was created to preserve. The demand for more power in the central government is a demand for less liberty in men. More central power means less local self-government.

One could wish for no more emphatic example of the effort to expand central power at the expense of local self-government and individual liberty than the current pressure to have "the general welfare" clause in the taxation section so interpreted as to give the Department of Agriculture absolute control of every farm; and the concurrent pressure to have "the commerce clause" so interpreted as to give a Federal board control of practically every industrial and business institution and every farm. Is it necessary to say that each uproots our fundamental principle of local self-government? Or that had any of the members of the Convention that framed the Constitution, or any of the ratifying States, suspected that these clauses could be susceptible of such construction, there would have been no Constitution, there would have been no Federal Union, there would have been no Republic of the United States.

Or is it necessary to say that neither the Convention, the States, nor the people of the United States, nor any responsible person in this country, considered at the time, or at any time thereafter for 140 years, that these clauses would or could ever be so interpreted—that all generations of Americans prior to this generation accepted and approved the clear meaning of the written words that the general-welfare clause was a limitation upon or a general objective of taxation, and that the regulation of commerce did not remotely connote the control of production or manufacture, of crops, or prices, of wages or hours?

Having set out the dominant ideas of the Constitution, I proceed now to discuss their value.

II. What has been and what is the value of these ideas of (1) National Government, (2) local self-government, (3) civil liberty, and (4) a government of powers enumerated, segregated, and distributed, of powers reserved to constituent States, and of rights and power reserved to the people as individuals and in the mass by States?

I can be brief, because I am speaking in the presence of the witnesses to the value of those ideas.

Here we are tonight in the one hundred and fifty-first year of our Government under that Constitution, under those dominant ideas which gave and continue to give it life.

Looking backward, we behold a remarkable progress, a progress without parallel in all the story of mankind. The feeble Republic of 1787 has become the foremost of nations, the mightiest and most wealthy of our time or any other. Its population conquered the wilderness and created great systems of agriculture, industry, commerce, and transportation. Our farmers and workers enjoy a standard of living without precedent and without equal. It may not be all that Americans wish, but it is better than the peoples of any other nation have hoped for. There are 30,000,000 families here and 45,000,000 of their members are engaged in gainful occupation—a job and a half for every family. Roads, schools and hospitals, parks and playgrounds adorn every scene. It is more largely than any other a land of home owners. We produce a real national income of $70,000,000,000 annually, by far the largest per capita on the globe. It is universally agreed that the lot of man in this Republic is superior to his lot in any other portion of the earth. It is said on high authority that the lot of the unemployed here is superior to the lot of the employed in Russia. We have brought to the feet of the millions the benefits of transportation, of invention, of scientific discovery, of sanitation and preventive medicine, and of vast benevolences, great universities, colleges, and libraries. Every boy and girl in our land can have an education free, and every decade has borne witness that the door of opportunity is open here to everyone who would prepare to enter. The rise of individuals from poverty to power is the unfailing characteristic of our life, and every father looks forward to triumphs of his children.

So attractive has our land been that only the barrier of exclusion was sufficient to prevent hundreds of millions of other nations from coming to share our lot. To the whole world American liberty has meant individual opportunity, and of the millions who have come here few indeed have been willing to return.

Our Republic has survived every test; under the Constitution we have triumphed over every difficulty. We have been victorious in every war; and the war between our States served, thanks to the Constitution, only to cement forever the bond of our Nation. In 1917 we found the nations of the earth in mortal deadlock, and threw a mighty force into the struggle and saved civilization.

We have overcome every depression. We have survived a thousand political mistakes and will survive others. Discontent has followed demagogues for a season in difficult periods, but common sense and a decent regard for honesty has always overthrown them. Party division, sectional jealousy, factional strife, and personal ambition have run riot here, but a virtue in the people has always shown the way to union. We have borne with much, and much have we learned by experience; we have known how to tolerate vagaries and yield to the purveyors of political nostrums; but in the hour when the evangels of discontent and the propagandists of personal ambition have ventured to invade or assault our Constitution we have known how to arouse and unite, forgetting partisan prejudices and sectional jealousies. As it has been, so may it be. The party of the Constitution in America has so far been—and I hope will always be—the party dominating all parties. There has ever been and always will be a constitutional union in our land far more powerful than any political party—a union of hearts constituting the great heart of the Republic. It has never failed us, and now it rises again in the mighty power to save.

I present the whole American achievement, the progress of six ever-increasing generations, as an exhibit in answer to those who now would undo or undermine the Constitution, without which the achievement could neither have been initiated nor carried on, and which is more responsible for all that we now enjoy in our civilization than all other causes short of the providence of the God of nations. I present the American achievement, individual and national, as the great trophy of our Constitution and its title to the faith of every American.

If men have made progress here, it is because men have been free here—free to think, free to speak, free to worship, free to work, free to enjoy in ways of their choosing the fruits of their labors, free to go forward on every function of the mind and the spirit, as well as of the material. In this new freedom not just a few but the millions of the humble have wrought with new access of energy, new hope, new enthusiasm, new daring, new conceptions of the dignity of man; and, best of all, in a new security of faith in themselves, their fellows, and in the institutions of government.

It is the Constitution which has provided this freedom. It is the barrier between the citizen and all who would oppress him, preventing equally the impositions of tyranny, whether of individuals, on the one hand, or of the mob on the other. Under its protection the humblest has known that no earthly power of office or majority could deprive him of life, liberty, or property without due process of law, i. e., without notice and trial in a free court and under equal laws. He has worshiped God without fear of persecution, he has owned his race without fear of discrimination, he has earned his daily bread or built a home without fear that any save himself could forfeit it, he has brought forth his children in the security of a state that would educate them, endow them with citizenship, vest them with the ballot, elevate them to worthy station, secure them in their persons and their property, and defend them against the alien enemy who would despoil them, and no less against the domestic victim of ambition who would impair the slightest of their rights. Under the Constitution none can make an American citizen afraid.

To these facts you and I now bear willing testimony, and bearing this testimony our hearts are resolved that, whatsoever the sacrifices, this heritage shall be handed down unimpaired to our children as our fathers saved it and handed it down to us.

And if this Union has been maintained in strength 150 years, it is not because the collective will of all the people has been imposed upon the people, but because home rule has been preserved as the President himself emphatically declared in 1930, not because the population has been regimented from Washington, but because men have been free.

I concede that we have not by any means achieved perfection. I agree that much remains to be achieved. And I argue upon the record, that the best guarantee of progress hereafter is the system under which we have wrought the matchless progress we enjoy today. The system that has served the fathers will serve their children. We can be patient with legislative and administrative experimentation, but we will have no experimentation with the foundations of our Government or the character of its institutions, or the muniments of our liberties. We will accept no substitute for liberty.

One hundred and fifty years of matchless national history and popular progress bear us witness tonight to the virtues of this Constitution. As guide and bulwark, pointing the way to a great people's triumphs and preventing encroachment upon their rights, preserving the form and the character of their Government and the spirit of the national and the individual life, we take no risk in saying in any company, that it has accomplished and maintained the exalted purposes which brought it forth: It has crefted a more perfect Union, it has established justice, it has insured domestic tranquillity, it has provided the common defense, it has promoted the general welfare, it has secured the blessings of liberty to our fathers and to ourselves; and by all that is written upon the brightest pages of human history, it must be relied upon to preserve those blessings to our posterity.

III. I come now, in conclusion, to speak of the current attacks upon this Constitution. And I come with great reluctance. I propose to array the evidence. You may draw your conclusions and face the facts as you see them.

One wonders that there are attacks, that there could be attacks. But anything can happen in the United States; it is a free country!

What shall be said when a President openly seeks power to mold the court of last resort to interpret the Constitution according to his views? What shall be said when Senators and Representatives pass bills of known doubtful validity and raise a howl when the Supreme Court declares them beyond the power of the Congress? And what shall be said when Members of the Congress boast that a studied policy of legislative and executive terrorism has coerced judgments from the Court validating acts that otherwise (as they boast, shamelessly I must say) would have been held unconstitutional? It is bad enough to attempt that sort of thing, but to boast of it is unspeakable. And what shall be said when a President urges a Member of the Congress to resolve his doubts of the power of Congress, howsoever reasonable, in favor of the Congress, well knowing that the Court must resolve its doubts in favor of the legislation—a process whereby reasonable doubts as to power are put in the way of becoming judicial presumptions of validity and the exercise of a power of known doubtful validity must be pre-

sumed to be not doubtful at all—a veritable scuttling of the constitutional limitations upon the power of the Congress!

And what, my countrymen, shall be said when a President of the United States argues in a public address that the entire police or social power of this country is vested in the Congress; that Congress may enact any law considered by it to be in the interest of the general welfare?

And what shall be said when a Congress is driven to abdicate its solemn responsibilities, abdicate its legislative powers, and grant them out to private citizens, and because the court of last resort upon complaint of a citizen declares that the Constitution condemns the procedure the President of the United States exclaims that the Court's action has returned us to "horse and buggy" days and a great hue and cry is raised? The simple truth is that that sort of thing, if unchecked, would have, indeed, carried us back to days when, so far as the masses of men were concerned, there were neither horses nor buggies—when a tyrant might go in a chariot but a man could not go at all.

And what shall be said when an Assistant Attorney General seriously argues that refusal of the Court to find power to enact any legislation of the last-elected Congress is a defiance of democracy, as did Mr. Robert Jackson at the University of North Carolina, October 12, 1937? What is that but to make a political and partisan instrument of the great charter—to reduce it to the status of a mere tool of a temporary majority?

Must an Assistant Attorney General of the United States be informed in the midst of this celebration—after 150 years of experience and extensive public education—that this is a constitutional representative democracy? That even the majority in any election is under a Constitution? And is it necessary to say to him that mass democracy is not American democracy? That there are States, there are Representatives? That it was never conceived that the people of Massachusetts were subject to the will of a national majority save in the limited national field? And is it necessary to say to him that mass democracy such as he advocates does not spell democracy at all but does spell dictatorship? Let him have his way—this spokesman for what we have heretofore considered to be the Department of Justice under the Constitution, and what has lately become the department of propaganda to undermine the Constitution—and he will have Americans to follow the paths all too broad in Germany and Italy to Der Fuehrer and Il Duce! Is it necessary to inform an Assistant Attorney General that we know that when he advocates mass democracy in the United States he knows he is advocating the overthrow of representative constitutional democracy, and consequent dictatorship? That when he attacks the Supreme Court for failing to follow election returns he knows he is undermining the Constitution?

Plain words! It is time for plain words in this land!

There is manifestly, my fellow citizens, a powerful direct attack upon the Constitution, and we must deal with it, regret the necessity though we may, and deal with it at once and in no indirect way.

I own to a loyalty to State, to party, to President. But there is a loyalty high above them all—it is loyalty to the Constitution in obedience to the people whose chief protection it is, and in obedience to my oath as citizen and as Senator.

The indirect attack upon the Constitution is more insidious and more powerful. It takes the form of appeals to the masses to the effect that their welfare, or their particular interests, demand the overriding of the Constitution. It is proclaimed, for example, that one-third of the people—that is, 40,000,000 of them—are ill-housed, ill-clothed, and ill-nourished; and it is suggested that the Constitution is the barrier between them and rescue. It is suggested if they are hungry, the Constitution is the reason. And if the method of amendment is proposed, they are told there is no time for that, the only constitutional method. It is proposed to have the Court amend it by interpretation. And if one arises to insist that the method provided in the Constitution is the only method, he is publicly pilloried as a Tory, a reactionary, an economic royalist, or a defeatist lawyer, or with some other prejudicial epithet; and at once the well-organized propaganda is set going to discredit and destroy him, to deprive him of the public esteem and drive him from public life. This is the European purge under the limitations of our American Constitution. Without the Constitution I leave you to imagine the form and method it would take.

Farmers are informed that they must abandon the principle of local self-government, submit to the central power and consent to the overthrow of the Constitution and their liberties in order to obtain fair prices for their crops; employers and employees are informed that they must repose their rights in the trust of a central board in order to conduct business or receive fair wages and improved conditions; all who are out of work are informed that the Constitution is the one barrier between them and gainful jobs; and if a man does not own a home it is suggested that he can never hope to have one under the Constitution. Every ill of the population is laid at the door of the charter of our national life, of local self-government, and individual liberty.

It is most unfortunate that this attack upon the Constitution has come on at a time when the public money may be distributed in the interest of the overthrow of the Constitution; when individuals receiving bounties and subsidies may be called upon to sustain the attack; when the officials of States, cities, and counties—standing around the National Treasury and crying for grants and allotments like children around a Christmas tree—may be given to understand that conformity with the attack upon the Constitution is indispensable; while the bosses of great machines, with the power of life and death over many mayors, some Representatives and Senators, and politicians in general, may send in their orders by long distance to "get right"—for projects mean contracts and contracts mean more power to the bosses.

It is the old, old method of overthrow and the rise to personal power. Absalom, sitting at the gate of his father's palace and with fair promises and seductive blandishments stealing the hearts of the people, cut the same figure.

And to what end is it all directed? The answer is plain—to the transfer of the vast and intimate police or welfare power of the States to central departments and bureaus, in which there is not one official elected by the people and responsible to them; directed no less to the abridgment of local self-government and the individual liberties which only local self-government may preserve.

The Socialists and Communists look on with envious, expectant, and admiring eyes. Their day, they say, is coming in a way they did not dare hope for. They give encouragement, knowing that the break-down of this Constitution will open to them the door which they could not otherwise have hoped to open short of bloodshed, and so remove the last barrier that holds them at bay. Their only question is, when the barrier shall be let down whether the Fascists will beat them to it. None have known better than they that the Constitution is the one barrier to their designs.

And I must add that practical politicians interested solely in their own welfare stand by, first looking one way then the other, speculating to determine how the cat will jump, and scheming for a seat in high places one way or the other.

What is the answer to this attack?

We offer the American achievement these 150 years as the overwhelming testimony to the Constitution. The Federal Union, local self-government, the principle of liberty have worked. You cannot argue against a success.

But those who would now undermine the Constitution are quick to agree. We are for the Constitution, they say, but give us more power. These times are new and difficult. Behold the new complexity of conditions. We must have more power. You must have less liberty. We believe in the Constitution, but not in local self-government, not in the liberties of men!

The answer is twofold. Present conditions are difficult—and so were conditions in 1787, 1857, 1892, new and difficult. The Constitution was meant for new and difficult conditions. Under it the people have never failed to meet new and difficult conditions under their own power!

If men cannot overcome difficulties with liberty, it is to be questioned whether they can do so otherwise. The whole of human history, past and present—and never before so emphatically as now in Russia, in Italy, and in Germany, bears witness that central control and bureaucratic rule as a means of governing degrades mankind, prevents the progress of men, and never has made for human welfare; that man has flourished only under liberty and local self-government. The dark ages were the ages in which the light of liberty was utterly extinguished—and that is the explanation of the longest and blackest night and deepest depression in all the story of the long struggle of men.

There is no good thing a government or a people can do so well as under a government of equal laws, based on federal union, local self-government, and the liberties of men.

There is nothing to be gained by altering in any fundamental way the character of this Republic, and, on the other hand, there is all to be lost. Liberty, life, property, homes, religion are put in jeopardy by the materialists who would convince the victims of an unfortunate hour that their material wants can be supplied by overthrowing their Constitution, and discarding the great moral and spiritual values of civilization. Let these victims have a care. Let them be watchful whether those who come with fair promises of welfare are not in fact more concerned to gain power and privilege for themselves. History is not without her lessons and her examples. The Government, the Constitution, your rights, are yours now—your birthright—and I warn you against any and all who would induce you to barter your birthright for anybody's mess of pottage.

Everything worth doing for the people of this Republic can be done within the terms of the Constitution as it is—as it has been understood now for a century and a half—can be done under its priceless safeguards. To seek more is to seek impairment of the instrument of the national life and the general welfare at the expense of the liberties of Americans and the hope of liberty in every nation, without which there can be no progress.

But granted that further power is needed by the Congress, there is but one way to power in America and that is by amendment duly submitted and ratified by the people in their respective States. To seek any other way is to attempt usurpation.

Agitators tell the hungry they cannot eat the Constitution. True. But the chance to eat under the Constitution is incomparably better than it would be without it. At least your will, your energies, and your rights remain free. At least you can have somewhat to say on the subject.

And so, Mr. Chairman, I conclude. Americans will resist this attack as devoted men and women. We will not count the cost. If a price must be paid, we shall pay it in full. If the Union, local self-government, and liberty came to us through suffering, we will willingly suffer to hand down our blood-bought heritage to our children.

We cannot fail. Our cause is imbedded in the nature of man. He was meant for liberty, and he knows it. Though they that be against us may for a season be more than they who are for us, though distress and discontent, fair promises, and soft manners and political power may deceive, obscure, and confuse for a time—even if this Constitution should in some desperate hour be overthrown—the human spirit would never rest until it had been

recovered. The revolution that brought it forth would be repeated a thousand times to restore it. The ideas which give it life can never die so long as men are made in the image of God and their Maker considers them but little lower than the angels and worthy to be called the sons of God and holds for them a heavenly destiny.

We battle with Him for the rights of His noblest creation—rights inherent in man—and without which he cannot be in the image of his Maker.

Debunking War Promotion

EXTENSION OF REMARKS

OF

HON. HENRIK SHIPSTEAD

OF MINNESOTA

IN THE SENATE OF THE UNITED STATES

Wednesday, December 1 (legislative day of Tuesday, November 16), 1937

ADDRESS BY BOAKE CARTER

Mr. SHIPSTEAD. Mr. President, I ask unanimous consent to have printed in the RECORD a radio address delivered by Boake Carter on October 18, 1937, on the subject Debunking War Promotion.

There being no objection, the address was ordered to be printed in the RECORD as follows:

Senator DAVID I. WALSH received a letter from the Maryknoll Fathers, the only Catholic missionaries in Japan, urging him to suggest to the State Department "a restoration of the previous attitude—impartial tolerance—as more practical." Senator WALSH sent the letter to Mr. Hull, Secretary of State. Mr. Hull answered in a letter to Senator WALSH that he did not think this Government need or should show tolerance toward action inconsistent with treaties to which this country is a party. The Secretary of State added that he believed "an attitude of indifference to the present conflict would be inconsistent with our policies." These policies, he declared, are to uphold the principles of international law and maintain sanctity of treaties.

In the light of this declaration it is therefore purely a matter of self-education to note certain incidents in our own history during the last 10 years. Some have pointed out that it is pointless to go back to the 1860's to observe breaking of treaties, or the carrying out of bombardments ourselves on foreign lands—because since then international morals have become much better and we don't now do the things we used to do. Then it becomes doubly interesting in this light also to scan the last 10 years of our own history from 1927 to 1937.

Therefore, while remembering the present moralizing sprung from the present bombing of Nanking, it is illuminating to note that 10 years ago, March 24, 1927, in conjunction with Great Britain, the United States Navy bombarded Nanking, China, wounding a number of civilian Chinese. The excuse for the bombardment was that there had been disorders, that the United States consulate there had been damaged and United States citizens hurt. London and Washington asked Japan to join in the bombardment, as the Japanese consulate had also been fired on, and Japanese nationals wounded. Japan, however, declined to join, and the United States and Britain went ahead.

On April 11, 1937, the United States delivered notes to two Chinese governments—there were two at that time—demanding apologies and indemnities. On April 14, the Nationalist Government of China, gave a reply. It also addressed the International Commission set up to inquire into the aspects of the bombardment. The Chinese Government note said: "As the laws of nations and the recognized practice of the civilized world prohibits the bombardment of a city or territory of a friendly state, the national government proposes that the Commission of Inquiry shall also investigate the circumstances of the bombardment of the unfortified city of Nanking by the naval forces of the United States, March 24, 1927." China's request was received and conveniently shelved—and in the past 10 years went into the limbo of almost forgotten things. At the time of the bombardment, Frank B. Kellogg, was Secretary of State. Simultaneously to the time the United States bombardment of Nanking was carried out, Mr. Kellogg ordered United States marines into Nicaragua, to overthrow the government of Juan Sacasa, who was not liked by United States financial interests. This venture into Nicaragua drew warm criticism from within the United States. Mr. Kellogg justified his action under the tenets of the Monroe Doctrine. This excuse was not accepted by the critics and he was hard put to it to find a more substantial explanation. Fortunately, the London Government, which had been helped by the United States in Nanking, came to his rescue. It sent him a note which declared that there was so much disorder in Nicaragua, that unless the United States could put a stop to it, Great Britain would have to send a warship or two to Nicaragua to tend to the matter herself. The you-scratch-my-back-I'll-scratch-yours reciprocation between the London Foreign Office and the Washington State Department served its purpose. And while United States guns dropped shells on Nanking, and United States marines chased the Nicaraguans, Mr. Kellogg was busily negotiating the Kellogg Peace Pact, which renounced war, bombardments, and force of arms as a means of settling international squabbles.

The story of our venture to Nanking just 10 short years ago is contained in a pamphlet written by Dr. Stanley Hornbeck, published by World Peaceways Foundation in 1928. Dr. Hornbeck is Far Eastern advisor to Mr. Norman Davis and the American delegation to the Nine Power meeting in Brussels. He is a firm believer in positive action by the United States in the Orient, is a Rhodes scholar, graduating from Oxford University, England, and is a staunch supporter of the foreign policies enunciated by the London Foreign Office. It is Dr. Hornbeck who will be largely instrumental in guiding America's fate in the Nine Power meeting. It is of interest to note that great praise was heaped upon the State Department and the White House by the nations when the Pan-American nonintervention treaty was signed, in which we expressed the view that it was the fixed policy of the United States that there was no excuse in intervening in the domestic or foreign affairs of any nation for any reason whatsoever. That was ratified by the United States Senate April of this year, 1937. It is now announced in October that we cannot be indifferent to what goes on in Asia and lead the way toward discussions leading to possible intervention. Thus one may wonder how April's attitude be made to appear consistent with October's attitude? The key to the Hull-Roosevelt foreign policy, as repeatedly pointed out by them, is that the one cure for war is to eliminate trade barriers. This has been pushed by the Hull policy of no-discrimination-against-any-nation reciprocal trade treaties. Tomorrow the White House and the delegation to Brussels confer on final instructions. One wonders what consideration, if any, will be given to the fact, almost entirely unknown to the public of the United States, that the United States and Japan signed a trade treaty in 1911, which is still in force and which says in article 5 of the treaty the following:

"Nor shall any prohibition be imposed by either country on importation or exportation of any article from or to the territories of the other, which shall not equally extend to the like article imported from or exported to any other country."

Now, quarantine of Japan has been mentioned by the Government of the United States. That can be done by official sanctions or official boycotts. It'll be, therefore, most interesting to see what the Brussels Conference will do. If sanctions are proposed and the United States leads the way, or joins in such measures, then the United States will become a breaker of this trade treaty and, according to Mr. Hull in his letter to Senator WALSH, no nation should have any tolerance for a breaker of treaties. There is a clause in the treaty which provides that either Nation must give the other 6 months' notice before abrogating it. Thus, to propose a quarantine is proposing action which would make them treaty breakers themselves. In the Ethiopian War the United States had a trade treaty with Italy, at the very time the Italians were gobbling up the luckless Ethiopians. Since that war ended that treaty has been abrogated by mutual consent of both parties, but at the time the trade restrictions were laid down by the State Department, which was at the height of the Italian campaign, the treaty was in force. The restrictions themselves were in open violation of that treaty then in force. Therefore, we were breaking treaties ourselves in 1935 and 1936, although Senator WALSH learns from the State Department in 1937 that nobody should have any tolerance for treaty breakers. These incidents all occurred in the last 10 years—bombardments and treaty breakings. It would seem they form an effective and devastating comment not only as to the vulnerability of ourselves when it comes to moralizing to others on the sanctity of treaties but also upon the question as to just how forward the fiber of international morals has progressed. Indeed, it is true one does not have to go back 75 years for examples. One need only go back to 1936.

Nazi Meeting in New York

EXTENSION OF REMARKS

OF

HON. BENNETT CHAMP CLARK

OF MISSOURI

IN THE SENATE OF THE UNITED STATES

Wednesday, December 1 (legislative day of Tuesday, November 16), 1937

ARTICLE FROM NEW YORK EVENING POST

Mr. CLARK. Mr. President, in the New York Evening Post of Tuesday, November 23, 1937, appeared a most startling and serious article recounting the use of the National Guard

armory in the city of New York by uniformed Fascists and Nazi organizations and the active participation in this foray of members in uniform of the military forces of the United States. It seems to me this is a very serious allegation. I ask that the article may be printed in the Appendix of the RECORD, and at an appropriate time I shall undertake to have steps taken to investigate the matter.

There being no objection, the article was ordered to be printed in the RECORD, as follows:

[From the New York Evening Post, Tuesday, November 23, 1937]

NEW YORK GUARDSMEN JOIN IN FASCIST MEETING—THIRTY IN UNIFORM MEET NAZI GROUPS ON NAVAL VESSEL—RUSSIAN, ITALIAN, AND UKRANIAN ORGANIZATIONS FORMED INTO LOCAL AXIS BY HITLER FOLLOWERS

("Primarily we are not citizens of states but racial comrades."—Josef Huenerfauth, leading Nazi philosopher.

("In admiration and deep faith, our racial comrades in foreign states look up to the Reich and its fuehrer."—People's League for Germanism Abroad

(How the Nazi movement in America, while not demonstrably seeking to overthrow the American Government, lives like a state within the state, always aping Hitler's Reich, will be shown in a series of which this is the first article.)

As Adolph Hitler, der Fuehrer, has his international Fascist axis in world politics, so do the Nazis of New York have their own local axis, an assemblage of every possible variety of homesick Fascist import from abroad.

All these gravitate about the leadership of the German-American Volksbund and the American Nazi fuehrer, Fritz Kuhn.

In any Nazi parade, review, rally, and celebration there are inevitably delegations from such brother organizations as the All-Russian National Front, the Ukrainian Hetmanci, and the Italian Circolo Mario Morgantini and Lictors Association.

The Russians are favorites among these little brothers of the Nazis, who have again and again made clear their yearnings for a chunk of the great area over which flies the hammer and sickle.

Only a few months ago Fuehrer Hitler, dreaming out loud, murmured, "If I had the Ukraine * * *."

FASCISTS HOLD BALL ON U. S. S. "ILLINOIS"

So, emulating the example of the all highest, New York's Nazis take the Russian Fascists closely to their bosom. But there is evidence also that another group in New York likes this Fascist axis and consorts with it—substantial numbers of the National Guard, a section of the United States military forces.

On the night of Saturday, November 13, Rossiya, a White Russian newspaper associated with the All-Russian National Front, gave a ball aboard the U. S. S. *Illinois*, which is tied up on Riverside Drive and serves as the armory of the First Battalion of the New York Naval Militia. It is customarily rented out at $225 a night to anybody who can put up that sum of money.

Tickets were sold widely in Yorkville. In fact, a general invitation was issued to the members of the German-American Volksbund through the local Nazi weekly, Der Deutscher Weckruf und Beobachter.

Guests in all types of Fascist uniforms filled the big drill hall aboard the *Illinois*. A crisp military air pervaded the occasion. Two heavy-caliber guns were fixed in the rear of the hall covering its entire width. Rifles and bayonets lined the passageway leading to the hall.

AMONG THOSE PRESENT, 30 NEW YORK GUARDSMEN

At specially reserved tables appeared several of the highest bund officials in full uniform. Russian Fascists stalked about in high boots and Cossack coats.

Also present were fully 30 men and officers in the uniform of the Army of the United States. Insignia on their tunics showed that they belonged to the Two Hundred and Forty-fourth Coast Artillery of the New York National Guard.

There was a lengthy program of Russian imperial and Fascist songs. On one occasion a member of the uniformed National Guard delegation stepped forward to take his place in one of the choral numbers.

As the evening got well under way there also arrived as honored guests two men in the uniform of the United States Navy. From the amount of braid on their uniforms they were evidently high-ranking officers.

Thus, wearing the uniforms of the American armed forces, American soldiers and naval officers participated with Nazi representatives in celebrating a Fascist occasion.

There was no doubt as to the Fascist nature of the occasion, which resembled in a local way a meeting of the members of Herr Hitler's axis. The speeches were devoted to attacks on communism, the Soviet Union, the loyalist cause in Spain, and the need of saving the world from bolshevism.

On sale at heavy-laden bookstalls was a great variety of literature, all Fascist. It included Russian Fascist papers from all parts of the world, most of them bearing a swastika on the front page. There was also a song book of the Russian Fascists from Manchukuo, again with a swastika.

GOEBBELS, MUSSOLINI BOOKS ON SALE

But also on sale were such Fascist classics as Bolshevism in Theory and Practice, by Dr. Joseph Goebbels, German Minister of Propaganda, which was a reprint of a speech at the Eighth National Socialist Party Congress; of Benito Mussolini's book, The Doctrine of Fascism; copies of Action, the British Fascist newspaper, and a violently anti-Semitic pamphlet, Downfall of Russia, published by the Right Cause Publishing Co. of Chicago.

This was not the first time that the Two Hundred and Forty-fourth Coast Artillery, a well-known New York outfit with its armory at Fourteenth Street and Sixth Avenue, had become publicly involved with Fascists.

Last February, Battery D of this regiment was found to have placed an advertisement in the local Nazi weekly, the Deutscher Weckruf und Beobachter, asking Germans to enlist and offering to take them with first citizenship papers.

The advertisement, when called to the attention of Adjt. Gen. Walter G. Robinson, commander of the New York Guard, brought down his wrath on officers of this battery. He termed the advertisement as "unfortunate, untoward, and by no means in good taste." He issued an order forbidding any repetition of this method of recruiting.

WEST POINT CADETS AT BALL, TOO

As to the two officers of the United States Navy who were also present in uniform—

According to Henry Rabusch, assistant to the superintendent of the U. S. S. *Illinois*, the officers had no connection with this training ship, but came as guests. Rabusch, incidentally, also identified among the guests a number of West Point cadets, but said they came in civilian clothes.

Although members of the American armed forces traditionally may wear their uniforms on social occasions with a military flavor, the appearance of the National Guardsmen and the naval officers at a Fascist celebration is apparently a flagrant violation of practice.

A reserve Army officer informed the Post that it is considered highly improper to wear such uniforms at political assemblages, particularly those involving foreign powers. A further aspect is that at this particular assemblage attacks were made on two powers friendly to the United States—Spain and the Soviet Union.

The presence of the naval officers, moreover, is a direct breach of the practice of the Navy Department. Assistant Secretary of the Navy Charles A. Edison, commenting recently on the claim of a member of the Stahlheim, German veterans organization, to have been invited by him to ceremonies at Fort Hamilton, not only denied knowledge of the incident but laid down this precept:

"It is the Navy's policy to have nothing to do with foreign nationalistic groups."

While Nazi penetration of the National Guard has often before been charged, a new aspect of the situation is the enthusiasm with which Russian Fascists have been enlisting in this armed force.

"These Russians," Rabusch commented, "have a lot of their men and boys in the National Guard, especially in the old Sixty-ninth (now the One Hundred and Sixty-fifth) and the Seventy-first Regiments."

The Post was further informed by Dmitri Sulyma, a member of the Ukrainian Hetmanci, that "most of the members of the Hetmanci of New York" were members of the National Guard. There are five Hetmanci in Battery CT of the Two Hundred and Twelfth Coast Artillery, he said, and six in Battery B. He himself is a member of Battery CT.

A prominent White Russian, moreover, is a Reserve officer. He is Capt. J. Rodyenko, once attached to the Two Hundred and Twenty-fourth Coast Artillery Regiment, the same outfit from which came the delegation at the Fascist ball, and is now attached to the Fortieth Engineers.

One Hetmanci, who was a corporal in the Two Hundred and Twelfth Coast Artillery, Eugene von Draginda, left New York 8 months ago, according to Sulyma, to become an inspector in the Ford service department, the private police force which the Automobile Workers Union has charged is used by Henry Ford for industrial espionage and other antiunion activities.

National Wheat Program

EXTENSION OF REMARKS

OF

HON. GEORGE McGILL

OF KANSAS

IN THE SENATE OF THE UNITED STATES

Wednesday, December 1 (legislative day of Tuesday, November 16), 1937

WICHITA EAGLE EDITORIAL ON SPEECH OF SECRETARY WALLACE

Mr. McGILL. Mr. President, on the 23d of November, Secretary of Agriculture Wallace delivered a radio address at Wichita, Kans., over a Nation-wide hookup, on the subject of a national wheat program. On the following day, November 24, an editorial was published in the Wichita

Daily Eagle, of Wichita, Kans., of which Hon. Victor Murdock is the editor in chief. Mr. Murdock was formerly a Member of Congress from Kansas for several terms and later a member of the Federal Trade Commission. I ask unanimous consent to have the editorial printed in the Appendix.

There being no objection, the editorial was ordered to be printed in the Appendix, as follows:

[From the Wichita (Kans.) Daily Eagle, November 24, 1937]

WALLACE'S SPEECH

Whatever may be said critically of Secretary Wallace's specific plans for the wheat farmer, the fact remains that he is raising his voice for and bending his efforts toward an adjustment that is absolutely essential if this land is to prosper. Everybody in Wichita, where the Secretary spoke yesterday, and in the region around it, should understand that without policies permitting farmers generally to make a profit there can be no prosperity for Wichita or for any other city.

By and large public policy and the trend of industrialism have favored the upbuilding of cities in America and the deterioration of the farms. That has resulted in so many punishing problems that the country is returning to a realization it never should have deserted—that given a sound agricultural structure most other good things will follow.

In taking a position against those who would let Nature take its course and those who would clamp on such rigid controls that America would be thrown back entirely upon its own markets, Secretary Wallace proposes six major policies for wheat that will operate in the field between the two extremes. Probably all of them will not work. Perhaps none of them will perform up to the expectations of their proposers. But there is a broad field of effort in which to exert effort for the aid of agriculture, and laborers in that field will do more for agriculture than those who propose to do nothing.

The Secretary's forceful, fighting speech in Wichita, addressed to a Nation-wide audience, adds to the sum of thought upon a problem which must be solved for the good of America.

Unemployment Relief

EXTENSION OF REMARKS

OF

HON. JAMES P. POPE

OF IDAHO

IN THE SENATE OF THE UNITED STATES

Wednesday, December 1 (legislative day of Tuesday, November 16), 1937

LETTERS FROM CHIEF JUSTICE OF THE SUPREME COURT AND GOVERNOR OF THE STATE OF IDAHO

Mr. POPE. Mr. President, I ask unanimous consent to have printed in the Appendix two letters, one from the chief justice of the supreme court of the State of Idaho and another from the Governor of the State of Idaho, with reference to a very important matter which I think should be brought to the attention of the Senate.

There being no objection, the letters were ordered to be printed in the RECORD, as follows:

THE STATE OF IDAHO SUPREME COURT,
Boise, November 20, 1937.

Hon. JAMES P. POPE,
United States Senate, Washington, D. C.

DEAR FRIEND: The Government of the United States is, as it should be, deeply and actively interested in finding employment for the employable unemployed of our country. It seems to me reforestation offers an excellent opportunity for the Government to give employment to a great many people and at the same time improve its own property.

I am informed by the State land department that in this State national forests occupy approximately 20,500,000 acres and that the State owns approximately 1,000,000 acres. While I have no information as to the extent of timbered and cut-over lands in private ownership in Idaho, we may very roughly state it to be from 3,000,000 to 5,000,000 acres.

As you know, during the last 30 years a good deal of forest land in Idaho has been cut over and lumbered off and several large areas have been burned over and the timber thereon destroyed. All of this burned-over and cut-over land is suitable for reforestation, and to reforest it would be a gigantic undertaking, much of which would have to be performed by hand labor. I know of nothing which offers a better opportunity for employment of the unemployed.

This letter is written in the hope you will give this matter thought and, if you believe it to be worth while, bring it to the attention of the administration and try to bring about cooperation between the United States and Idaho, to the end that the forests of our State be perpetuated.

If this can be done it will go a long way toward the solution of our irrigation and erosion problems, will stop the filling of our reservoirs with silt, and will provide building materials for those who come after us. I have read and heard that in Norway, Sweden, Germany, and probably some other countries of Europe plans for reforestation have been carefully made and carried out successfully. Probably an investigation of this matter and a study of the problem as it has been met and solved in those countries would be of help to us.

Of course, there are many States which do not embrace Government lands, and in such States some other plan will have to be found to take care of the unemployed, but in Idaho and other States where the Government owns forest lands, it seems to me employment may be offered to the unemployed without making United States citizens feel like recipients of charity.

I am writing a letter similar to this to each Senator and Representative from Idaho.

Your friend,

WM. M. MORGAN.

STATE OF IDAHO,
OFFICE OF THE GOVERNOR,
Boise, November 23, 1937.

Hon. JAMES P. POPE,
United States Senator from Idaho, Washington, D. C.

MY DEAR SENATOR: The Government of the United States is, as it should be, deeply and actively interested in finding employment for the employable unemployed of our country. It seems to me reforestation offers an excellent opportunity for the Government to give employment to a great many people, and at the same time improve its own property.

I am informed by the State land department that in this State national forests occupy approximately 20,500,000 acres and that the State owns approximately 1,000,000 acres. While I have no information as to the extent of timbering and cut-over lands in private ownership in Idado, we may very roughly state it to be from 3,000,000 to 5,000,000 acres.

As you know, during the last 30 years a good deal of forest land in Idaho has been cut over and lumbered off, and several large areas have been burned over and the timber thereon destroyed. All of this burned-over and cut-over land is suitable for reforestation, and to reforest it would be a gigantic undertaking, much of which would have to be performed by hand labor. I know of nothing which offers a better opportunity for employment of the unemployed.

This letter is written in the hope you will give this matter thought and, if you believe it to be worth while, bring it to the attention of the administration and try to bring about cooperation between the United States and Idaho to the end that the forests of our State be perpetuated.

If this can be done, it will go a long way toward the solution of our irrigation and erosion problems; will stop the filling of our reservoirs with silt, and will provide building materials for those who come after us. I have read and heard that in Norway, Sweden, Germany, and probably some other countries of Europe plans for reforestation have been carefully made and carried out successfully. Probably an investigation of this matter and a study of the problem, as it has been met and solved in those countries, would be of help to us.

I am writing a letter similar to this to each Senator and Representative from Idaho.

BARZILLA W. CLARK, *Governor.*

Peace Record of Hon. Hamilton Fish

EXTENSION OF REMARKS

OF

HON. LOUIS LUDLOW

OF INDIANA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, November 30, 1937

Mr. LUDLOW. Mr. Speaker, the gentleman from New York, Mr. HAMILTON FISH, ranking minority member of the Committee on Foreign Affairs, has seen fit to call particular attention to the nonpartisan character of my proposed amendment to the Constitution (H. J. Res. No. 199) which

seeks to give the people of America the right to a referendum vote on declarations of war, except in the case of attack or invasion. Surely all will agree that Mr. FISH is right. The purpose of the proposed constitutional amendment is to keep our boys out of the shambles of foreign wars and that never has been and never will be a partisan issue. The sacrifice that breaks up happy homes, tears heartstrings asunder, and bows nations in grief will never yield to measurement by any partisan standard.

It is a matter of much satisfaction to me that support of my proposal comes in about equal measure from both sides of this Chamber, which stamps it as a national issue, undiluted by partisanship, an issue that appeals to patriotism and rises away above the grovelings of party spirit. I could name a long list of fine and able supporters on the Democratic side of the Chamber, and I might match it with an equally long list of fine and able supporters across the center aisle, all of which again demonstrates that when it comes to protecting our rights in the family of nations and devising means to keep out of foreign wars, politics stops at the water's edge.

But it is of Mr. FISH himself and his activities in behalf of peace over a long period of years that I wish especially to speak on this occasion. According to my way of thinking he has been so uniformly and undeviatingly right on foreign questions that I would like to call attention to his record.

His ranking position on the Committee on Foreign Affairs lends especial significance to his views and activities in the foreign field. If his party should regain control of the House, he would become chairman of that great committee, succeeding the able and distinguished gentleman from Tennessee.

Recently the gentleman from New York, in an address in this Chamber, gave me credit for the favorable position which the proposal for a referendum on foreign wars now occupies before the Congress and the Nation. I fear that he was overly generous to me and not generous enough to himself. It is true that I have worked very hard for years in promoting that proposal, to the extent that it long since became a burden equal at least to one-third of the work of my office; but the gentleman from New York himself is a pioneer in seeking to secure for the masses of the people of the United States the right to express themselves by a referendum vote on proposals to enter foreign wars.

A World War soldier with a record of distinction, he knows what war means and he has exerted the powers of an able and alert mind to keep America out of foreign entanglements.

As far back as the early days of January 1929, he introduced in the House a resolution giving to the American people the right to vote on declarations of war, except only wars of defense, and on January 10 of that year he made a stirring speech in this Chamber in which he said:

> There are an overwhelming majority of the people who believe that the renunciation of war, except for self-defense, is the most forward step taken to do away with, or at least limit, wars, since the begining of all history. * * * The resolution that I have proposed gives the power to the people of the country to determine whether we shall go to war except in self-defense. * * * I propose this amendment not as a millenium, not as a panacea to forever do away with wars, but as a fundamentally sound proposal that the people be given the right to ratify a declaration of war made by the Congress, except in case of invasion or threat of invasion.
>
> It seems to me that the time is ripe for careful and serious consideration of such a proposal * * *. The Congress of the United States is not elected upon the basis of war or peace. It is elected on partisan issues. It is elected on issues of the tariff, on financial issues, on peacetime issues, and may not be representative of the great mass of the American people on the question of war or peace. When you come to consider this resolution I hope that you will not consider it as something radical or urging peace at any price. We surrender no rights by this resolution. We simply permit the American people to be heard on the question of war or peace in case of a war of aggression. * * * Why not have faith in the people of the United States and give them an opportunity to vote on this greatest of all issues involving their life, liberty, and pursuit of happiness? Let us bring the question of war and peace out into the open for the inspection and determination of a great self-governing people.

The arguments so fervently urged by the gentleman from New York 9 years ago are just as applicable today to the proposal for a referendum on war, which I have the honor to sponsor.

There is one other measure introduced by Mr. FISH, bearing upon our foreign relations, to which I would like to advert at this time because, in my opinion, it has outstanding merit. That is his resolution, House Joint Resolution No. 300, to prohibit the peace-time shipment of arms, ammunition, and implements of war from the United States to foreign countries. It is difficult to comprehend how a Christian nation can tolerate the un-Christian practices of the munitions traffickers, whose sordid operations were revealed in all their naked hideousness by the Nye committee. The printed hearings before that committee comprise one of the most shameful stories ever written into legislative annals, showing how "merchants of death" have thumbed their noses at sacred treaties and embargoes and have sent their agents all around the world for the deliberate purpose of fomenting strife in order to reap dirty dollars from the sale of implements of destruction.

The Fish resolution would put an end to this unconscionable traffic. A discharge petition is on file at the Speaker's desk to bring House Joint Resolution No. 300 before the House for a vote. It ought to be taken up and passed immediately. Not only are the foreign sales practices of these concerns iniquitous in the extreme and violative of every principle of humanity, but it is undoubtedly true that American-made munitions are finding their way to potential enemies and may be used later to kill American soldiers if unhappily war should break out between our country and these nations that are using America as a supply house for munitions.

On all matters pertaining to international relations the gentleman from New York [Mr. FISH] has displayed high initiative, clarity, and sweep of vision, and his district ought to be proud of the contribution it has made to the service of the Nation.

Our National Flag

EXTENSION OF REMARKS

OF

HON. JAMES J. DAVIS

OF PENNSYLVANIA

IN THE SENATE OF THE UNITED STATES

Wednesday, December 1 (legislative day of Tuesday, November 16), 1937

ADDRESS BY LT. COL. A. M. EDWARDS

Mr. DAVIS. Mr. President, I ask to have printed in the Appendix of the RECORD an address delivered by Lt. Col. Arthur M. Edwards, retired. His address is entitled "Our National Flag," and very graphically describes the symbolism of the red, white, and blue.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

Mr. Chairman and friends, on June 14, 1777, the Continental Congress resolved that the flag of the 13 united States should be 13 stripes, alternate red and white, and that the union be 13 stars, white in a blue field, representing a new constellation among nations.

This official action came after a year's deliberation, for in May 1776, when a declaration of complete independence from England was being planned, Congress had appointed a national flag-designing committee consisting of Robert Morris, the self-sacrificing patriot financier; Gen. George Washington; and Col. George Ross.

These men met at the Philadelphia home of the latter's niece, Mrs. Betsey Ross, a soldier's widow. She was an expert needle woman with artistic ideas that, with the committee's guidance, helped to design our glorious national Star-Spangled Banner.

After the Battles of Lexington and Bunker Hill, where a white flag was used, bearing a pine tree with the words, "An appeal

to heaven," a congressional committee headed by Benjamin Franklin visited General Washington near Boston, Mass., to create a colonial flag, national in its tendency, yet not showing complete separation from England. This group decided upon a flag with 13 horizontal stripes, alternate red and white, 7 red and 6 white. This made the top and lower stripes red. In the upper left-hand quarter of the flag in a blue rectangular field there was a neat combination of crosses of St. George and of St. Andrew, a small Union Jack.

This expressed really the idea of home rule for the colonies, preserving final allegiance to Great Britain.

St. George's crimson cross of courage at right angles was established as an English flag by King Edward the First, since he so devoutly admired the wonderful exploits of this patron saint, about whom he learned while on a crusade to the Holy Land.

The flag of Scotland was St. Andrew's diagonal cross of pure white representing the purest Christian virtues. These two flags were blended into one when the Kingdoms of England and Scotland were united under King James the First. Thus, these colors commended themselves to the American flag seekers as symbols of valor and virtue to represent the Thirteen Original Colonies.

This American flag (with the blended crosses of St. George and of St. Andrew where our white starry blue union now is) was first hoisted as "The Great Union Flag" over the fort at Prospect Hill, Somerville, Boston, Mass., on January 1, 1776.

General Washington, then in command there, said: "We hoisted the Union flag in compliment to the united colonies and saluted it with 13 guns."

As the Revolutionary struggle developed more desperate and bloody fighting with its consequent bitterness, the idea was born of complete national independence.

Then came in May 1776 the flag meeting in Philadelphia when our national flag was planned. This idea is said to have come partially from the Washington family coat of arms, adapted to our national political situation.

In place of the blended British crosses, 13 white, 5-pointed stars, representing the 13 independent States, were arranged in an appropriate circle in the center of the dark-blue rectangular field which has a length or fly of seventy-six hundredths of the length of the flag with a vertical width or hoist of seven-thirteenths of the width of the flag. The length of the flag is about twice its width. There are small flags for rough or windy weather, with larger flags for special occasions, and special flags for the President, Secretary of War, and designated officials.

In the blue union there are now 48 stars for our 48 States, arranged in six horizontal and eight vertical rows. On July 4 of each year a new star has been added for each new State admitted during the previous year. This makes the cannon salute to the Union given now on July 4, our national birthday, 48 guns, fired at intervals of 10 seconds.

The blue field is the honor point of the flag which, when placed flat for memorial purposes, should always be on the flag's own right or on the observer's left as he faces same, just as in heraldry or in battle, the right or sword arm was the point of danger and hence the point of honor. The honor place of a flag is on the right of a line of troops or at the top of a staff or above all other flags. See that it is always paid the honors that are due to it.

General Washington was so pleased with the beauty of the new flag that in a few weeks he told General Putnam to supply one to each regiment. This was before the official adoption by Congress. These new flags were all made by the eager hands of the patient, persistent, peace-loving Quakeress, Mrs. Betsey Ross, who toiled in daylight and at times from dusk to dawn by candlelight to make flags that stirred thousands of ragged and hungry but valiant Continental soldiers to struggle for our national independence.

There is no doubt that General Washington carried the new national emblem when he crossed the Delaware River on Christmas Eve of 1776 to win the Battle of Trenton, followed soon by a victory at Princeton. Competent historians say that indirectly then and there he won the American Revolution.

"Breathes there a man, with soul so dead, who never to himself has said, This is my own, my native land?"

Our flag is the emblem of our country's majestic sovereignty, protecting power, and inspiring ideals. It should be respectfully saluted when carried as colors by organizations marching on foot, or as standards when mounted, or when flags are raised to or lowered from the top of a flagstaff in special ceremonies. Military people in uniform render the right hand salute, or under arms give the prescribed honors.

Civilian men should uncover in pleasant weather, standing at attention in silence, holding the headdress over the left shoulder with the right hand until the flag has passed in procession or any flag ceremony completed. In stormy weather, the honor is modified to protect one's health by slightly raising the hat.

Ladies in saluting do not touch the headdress, but should silently stand at attention with the right hand over the heart.

Spare the dignity of proud Old Glory and treat it with loving reverence.

When you salute our flag you give evidence of your allegiance to the Nation that has benefited millions besides yourself with its institutions, sacred, wonderful, and free. By failing or refusing to honor our flag you show yourself to be ignorant or disloyal. You do not need to salute every piece of red, white, and blue bunting you see draped in public and private, or flags as they fly from flag poles or buildings, or small flags carried promiscuously by individuals.

Be exceedingly careful, however, to salute flags carried as colors or standards by marching organizations representing official national allegiance to our United States of America.

Again we wish to emphasize that in flag etiquette, as in heraldry, the point of honor is on the right of the flag as occupied by the starry blue union. Therefore when the flag is displayed flat against a surface the union should be on the flag's own right as it faces an observer, or on the observer's left as he looks toward the flag. When displayed on a staff in any position the union should always be next to and at the staff top, except for mourning purposes, when it is half way down from the top.

Never let Old Glory touch the ground, the floor, or trail in water. It should always be above or to the right of other flags in point of honor. When stretched on a wire across a street the union should be toward the north or the east, according to the street direction.

In any indoor assembly the national flag is on the speaker's right when on a raised platform. When in the body of the hall below the platform it should be on the assembly's right as it faces the speaker. The flag should never drape a desk or stand. Use bunting. The flag displayed with the union down is a signal of distress. The latter should be placed over the left shoulder of a coffin, carried feet first, having the flag removed before burial.

On Memorial Day, May 30, our flag is displayed at half staff from sunrise to noon when it is raised with the national salute and appropriate ceremonies. It flies from the staff-top from noon to sunset.

On other national and specially observed holidays the flag should be displayed from sunrise to sunset. It should be displayed every day from schoolhouses and from public buildings as it is our national emblem always to be respected in loyal pride.

Our national flag is never dipped in salute. It receives the national salute of 21 guns. It should never be commercialized or carelessly used so as to lower its dignity. It should be carefully stored when not in use and never slighted or dishonored. Faded or torn flags made valueless by service may be privately burned. Do not drape the flag over any part of a vehicle, railroad train, or boat. Use bunting. Small flags on staffs may be secured to the chassis or radiator cap of an automobile.

In the interest of international friendship we should always show respect to the flags of friendly foreign nations and to their national anthems. Our own anthem The Star-Spangled Banner is always honored in a manner similar to our flag.

This is a most noble appeal to love and honor our flag, born as it was from the loyal brain of a patriot poet, Francis Scott Key, who, powder-stained and weary, in an anxious night-long vigil, while temporarily a prisoner on an enemy ship-deck, penned his stirring lines of ardent patriotism and flag-love, which all Americans should learn, ending with the following sentiment which should actuate every loyal citizen.

"Then conquer we must when our cause it is just
And this be our motto: 'In God is our trust'
And The Star-Spangled Banner in triumph shall wave
O'er the land of the free and the home of the brave."

A salute to our National flag should not only express gratitude for its protecting privileges but also loyalty to our beautiful symbol of proper popular liberty under law. If you enjoy blessings under our flag and yet refuse to honor it, you become an undesirable citizen by disloyalty to American laws. Being thus an outlaw you should have no place in these United States of America.

A respectful salute to their flag by the citizens of any country is only a reasonable part of that loyal patriotism which has been commanded by the best civilized nations of all history. This is the only true guide to the most enlightened mental, spiritual, and political faith and practice.

As well take the cross of Christ from the Christian Church as to take the American flag from the schoolhouse. It is the symbol, not of war alone or of our Federal sovereignty, but of the noblest ideals of the home; the church with freedom of true worship and of free and Christian education. The great task of the educator includes not only academic excellence, but also those effective loyalty lessons in enlightened patriotism that promotes the welfare of the State by preserving the liberties and sacred institutions of our country, who will reward its devotees in loyal pride.

From the beginning, our American flag, the most beautiful patriotic trinity of symbolism in color, the most radiant banner in the world, has spoken to its citizens of American ideals of equality of opportunity and the enjoyment of a happy life with liberty without license, as proclaimed by our Declaration of Independence.

It proclaims under our Federal Constitution the principles of freedom and equality under law, an "indestructible union of indestructible States," honest justice, national tranquillity, intelligent and scientific national defense, and the general welfare as ordained by the American people. May no group, insatiably ambitious, destroy the intrinsic integrity of this fundamental instrument of government framed by conscientious patriots inspired by the most enlightened and liberal constitutional principles ever conceived and the righteous wisdom of the Holy Scriptures.

Our flag is the most valiant and virtuous in war and the most beneficent in peace, as it blesses the people with the lofty, moral ideals and the sacred treasures of enlightened freedom. It is the most honest banner in the world and the most humane in a pinnacle of integrity all its own. It is the eternal living majestic emblem of our righteous national sovereignty.

Our flag not only embodies our highest aspirations but it is also symbolic of our achievements. It grows more lovely each year as our loyalty grows stronger to our enlightened sovereignty. Let us drink deeply today from the fountain of pure patriotism

to protect our country with eternal vigilance. Let us fondly renew the creed and vital article of the faith and practice of staunch Americanism as we declare: "I believe that it is my duty to my country to love it, to support its Constitution, to obey its laws, to respect its flag, and to defend it against all enemies."

Let us memorize in heart and mind the following, ready to repeat it as occasion requires. "I pledge allegiance to the flag of the United States of America and to the Republic for which it stands. One Nation, indivisible, with liberty and justice for all."

Of our flag symbolism, General Washington said: "We take the stars from heaven, representing a new national constellation, the red from our mother country, separating it by white stripes showing that we have separated from her, and the white stripes shall go down to posterity representing liberty."

To this we may add as an inspiration from St. Andrew's cross the Christian purity of purpose in thought, word, and action in exercising our enlightened civil liberties in public and private life, moral cleanness and the radiant hope for a happy and secure future.

Under laws untarnished by license it means righteous and helpful liberty and worthy freedom which helps to achieve all that is noblest and best in our national welfare. It permits to us the pursuit of the abundant life providing we in Christian charity safeguard the rights of our fellowmen with justice and moral integrity. Well does the poet say, "May peace and order and beauty draw round our pure symbol of light and law."

The red symbolizes bravery to do and to dare, in martial force when necessary, in every righteous cause as our martyred patriot fathers did, whose courage rose with danger. They shed their blood in vicarious sacrifice that this Nation might be forever securely preserved. May this symbol inspire us with the same dauntless spirit that actuated our forefathers as they legislated our National Declaration of Independence, July 4, 1776, so that we may never falter nor fail in our full duty to our country.

This crimson tide also means the moral courage and strength to combat mightily all social, political, and economic evils in peace or war. This courage to suffer even unto death for our flag must spring from love—constant, strong, and true. Well spoken is he who says:

"Flag of the free hearts hope and home
By angel hands to valor given."

As this symbolism of our flag is spiritual, it is enshrined with much of the soul's bright immortality in its courageous hope. Thus freedom's banner grows lovelier with the years if virtue will ever keep a shining pace with valor. The red blends with the rectangular blue union, which stands for profound and endless loyalty to our country. Blue is said to be the color of the great mother force in life, the power that brings forth and cherishes all that is lovable, noble, and true. In this union are the white stars of national faith and hope.

Each five-pointed star is an ancient symbol for man. It may be taken to represent a sovereign State throbbing with the sworn loyalty of living citizens. It denotes the spirit of helpful service in benign brotherhood and Christian cooperation throughout this fair land which will consolidate us into a people who can withstand all the assaults of our enemies, forever defending the most ideal interests of our Nation. Such a sentiment was approved by our Divine Saviour, who preached continuous and lofty patriotism.

Therefore righteous liberty with exalted union must forever unite us into a mighty Nation, irresistible and invincible if we would preserve the spirit of our patriot founders. From the starry union of our flag as our blue field of national idealism we may interpret the following messages from each five-pointed star:

These are the five desirable living qualities of honor, service, valor, virtue, and protection.

We start with the first star point of honor, which always points upward in the zenith. It should always be most prominent in our minds, pointing heavenward. This quality includes honorable dealings among ourselves and with all nations maintaining a just peace as long as right and proper. Service, the second star point, national and international, ever remembering the sacred word that "He who does not care for his own is worse than an infidel." Valor, the third star point, stands for defense when necessary against all foes without and within, scourging any disloyalty within our borders. Our defenders may die, but they should never surrender. The sword of righteousness against evil aggression is approved by the Holy Scriptures. It is urged by all the dictates of loyalty to home and country. Virtue, the fourth star point, is the achievement of those righteous ideals which should govern all public and private relations. Protection, the fifth star point, inspires the thought that all true Americans should be ready to protect the best interests of their country when it is threatened by domestic or international violence. In return for this service the National Government should properly care for its defenders. In all these considerations America has been supreme among all nations.

When the fair components of our national emblem are so harmoniously blended they signify in all their splendor a sublime unity and all that is good, beautiful, and true in patriotism. In a strength of noble purposes it appeals to Heaven for lasting loyalty from all.

Therefore, I repeatedly urge these flag lessons upon all citizens. I pray fervently that all Americans may be baptized with zeal for God and country both in peace and war. Be loyal, and the loyalty that lies in other men, sleeping but never dead, will rise in eagerness to meet thine own.

All loyal Americans should unceasingly combat those unfriendly influences in our midst which seek our ruin. Beware of foreign intrigue and treason masquerading as a false religion. Let not unpatriotic teaching in academic places nor intellectual anarchists, evaders of eternal truth, deceive you. Do not let morons in patriotism lure you to error. Let us be neither fools nor cowards. No loyal person of sense should object to swearing allegiance to the American national flag and to our Federal Constitution. This requirement eliminates dangerous agitators who by unmoral and treasonable propaganda would crucify our Federal Union.

Former President Harrison said: "God pity the American citizen who does not love the flag, who does not see in it the story of our great, free institutions and the hope of the home as well as of the Nation."

Now again I repeat, our motto must be: "On guard, America." By valor and virtue forever stand firm and loyal to God and country. Whether it inspires us to battle or the cultivation of virtuous citizenship, I ask you all to show respect to our beloved national flag on every occasion that requires it. Teach your children to love and salute it. There is nothing in the Bible that forbids such action.

May we enter into a new covenant with our souls by showing more love for our country and more respect for its matchless banner. If we follow these principles we may take courage because we shall not fail in crucial hours. America will be preserved inviolate.

I now close with a flag song I have written to the music of the Army bugle call, To the Colors, which is used to honor the flag by the field music when there is no band to play the national anthem. This song is approved by our War Department. I hope that it may become popular, as it is really a short oath of allegiance or loyalty lesson, suitable for true Americans. This is not meant to replace the national anthem, but it aims to promote flag loyalty:

To our flag, to our flag, to the red, white, and blue;
To its stars and its stripes may be ever be true.
We shall fight for the right in the strength of God's might
And be faithful in our service to the red, white, and blue.
Hail the red, bravery; white, liberty; blue, loyalty.
In thy purity, sovereign emblem, we live and die for thee.

Prevention of War

EXTENSION OF REMARKS

OF

HON. HENRIK SHIPSTEAD

OF MINNESOTA

IN THE SENATE OF THE UNITED STATES

Wednesday, December 1 (legislative day of Tuesday, November 16), 1937

RADIO ADDRESS BY HON. HENRIK SHIPSTEAD, OF MINNESOTA, TUESDAY EVENING, NOVEMBER 16, 1937

Mr. SHIPSTEAD. Mr. President, I ask unanimous consent to have printed in the RECORD a radio address delivered by me on Tuesday evening, November 16, 1937, on the subject of Prevention of War.

There being no objection, the address was ordered to be printed, as follows:

Ladies and gentlemen of the radio audience, I have the honor on this occasion to speak to you under the auspices of the Council for the Prevention of War, and take great pleasure in doing so.

All the world's people say they hate war and at the same time all governments prepare for war. I am not going to speak to you about the horrors of war or the futility of war. You know that already. I am going to talk to you about the prevention of war. It is difficult to prevent war unless we understand how war is made. We know many reasons why wars are made but we sometaimes fail to understand how the war makers make war possible. They cannot make war unless they can get the people to support war.

The most dangerous thing connected with war is the people's will to war. That will must be manufactured. The state of the public mind must be prepared in favor of war. That state of mind is being prepared now all over the world. It has been going on in this country of ours, too, for several years. It has shown its ugly face in this country by speakers appearing before peace societies talking about the horrors of war and at the same time arguing that when war comes we cannot keep out of it and we must do our share.

When a government makes war it must make the people believe it is for a good purpose. Any particular war into which a government seeks to plunge its people must be made to appear such as, a war to save democracy, or to abolish autocracy, or

dictatorships. When politicians find people discontented at home, they begin to talk of the sins of other governments and peoples.

I am talking now of war for conquest of territories or trade routes or oil fields or raw materials, etc.

I am not talking of war in case our country is attacked. If the United States territory is attacked by any foreign nation, it would be an act of patriotism for every person in the United States to defend this country, if necessary on the battlefield, but we are not going to be attacked. I have always contended that it is the first duty of an American citizen and statesman to carefully guard the interests of his own country. Statesmen of other countries play the game that way. Why should not we? We deplore the horrors of wars now going on. I am sympathetic with the idea that all people and all nations and governments, including our own, should be good. But I have no sympathy with the idea that we should send our armies and navies to foreign countries to do missionary work with the bayonet among other nations and to compel other nations to be good.

When people are being prepared to make war we are always told how bad other people and nations are, how bad other governments are, and how good we are. Many people have the notion that when other governments behave badly we should send armies over to kill their people for fear they might come over here to kill our people. History does not teach that war has raised the standard of morality in international politics.

We were told in the last war that unless we went to Europe, sent our boys to die in the trenches, that Germany would come over here and take our country. We now know that this kind of talk was all bunk. Military experts have definitely exploded that idea. We are being told now the same kind of a story that unless we go some place and make war on other people they will come and make war on us. To those people I would say if any nation wants to come and attack us, we will take care of them when they come.

At the present time all kinds of military and naval alliances are arranged for the purpose of making war, but we are told that these alliances are really organizations for peace. The triple alliance and triple entente were made for war but the people were told, and made to believe, that they were instruments for peace. The Carnegie Foundation for peace became a propaganda organization to get us into the war when war broke out in 1914. On April 20, 1917, the board of directors unanimously passed the following resolution:

"*Resolved*, That the trustees of the Carnegie Endowment for International Peace, assembled for their annual meeting, declare hereby their belief that the most effectual means of promoting durable international peace is to prosecute the war against the imperial Government of Germany to final victory for democracy, in accordance with the policy declared by the President of the United States."

Sir Gilbert Parker, of the British Army secret service, was made the chief of propaganda of the United States for the British Foreign Office. The purpose was to conduct propaganda to get us into the war. His duty was to convince the people of this country that we should go to war in order to have peace. He said that his mission was one of great delicacy. He said that he started his propaganda with university and college professors. He did his work very well.

Now, at this time, we have people traveling over this country speaking and giving interviews to the newspapers telling our people we should make war on Japan or mix into the controversy in Spain. Why not concentrate on home affairs? No country will attack us. We are too far away.

It would be pertinent to ask them why they are so concerned about the welfare of foreign countries. Such concern at times may be commendable. However, when such concern is finally developed into a demand that we shall make war because we do not like what foreign nations do, then the motives of these people should be questioned. History proves that nations now so concerned about China have always exploited China. Of course, the war going on there now is brutal. However, it is no more brutal to women and children than was the food blockade of Germany after the armistice of 1918; or the concentration camps of the British imposed on the Boers; or the French wars in Africa; or the looting of Peking by the allied armies of all the so-called Christian nations.

War makers always prepare the people for war by talking peace—getting the people so interested in peace they are willing to go to war. They stir the country into a frenzy of war fever. At such times people are made to believe that the most vile things are beautiful.

I have talked to you about the prevention of war. I have tried to explain to you how the war makers make war possible by cleverly operating upon the minds of the people with clever propaganda.

Hegel said that people cannot learn from history except one thing—that is, they cannot learn from history.

Often war is started very gently. For instance, by quarantine and economic boycotts. People are led to believe that with an economic boycott no one will be shot; no one will have to die. A boycott of any kind is an act of war. It is, in fact, a blockade. Instead of a blockade by warships being sent to surround a country and keep it isolated so goods cannot come in, an economic blockade is a blockade from a distance by prohibiting the shipping of goods to a country against which we want to make war; an economic boycott or blockade is the first step to war.

The most high-powered salesmanship in the world will be centered upon us to get us in on one side or the other, if and when the next war comes. There is nothing new in the picture from the last war; they have only changed the names. They want us to go to war now against dictatorship; in the last war they called it autocracy. They say now we must save democracy. That was what they said then. The question is, Are we able to learn anything from history? We shall see what we shall see.

Dedication of Federal Building at Centralia, Wash.

EXTENSION OF REMARKS

OF

HON. MARTIN F. SMITH

OF WASHINGTON

IN THE HOUSE OF REPRESENTATIVES

Wednesday, December 1, 1937

ADDRESS OF HON. JAMES A. FARLEY, POSTMASTER GENERAL OF THE UNITED STATES, AT THE DEDICATION OF THE NEW FEDERAL BUILDING AT CENTRALIA, WASH., OCTOBER 15, 1937

Mr. SMITH of Washington. Mr. Speaker, under leave to extend my remarks in the RECORD, I insert the text of the speech delivered by Postmaster General James A. Farley at the dedication of the new Federal Building at Centralia, Wash., October 15, 1937, in my congressional district.

The address of the Postmaster General of the United States is as follows:

It is good to be in Centralia today and have the opportunity of participating with the citizens of this city in the ceremonies incident to the dedication of your new post office.

I am especially delighted today to be in Centralia with my good friend, your Congressman, MARTIN F. SMITH. This district may well be proud of Congressman SMITH'S able representation in the House of Representatives. He has at all times supported the administration and President Roosevelt in his efforts to be of assistance to the people. I congratulate this district upon its good judgment in selecting as its representative Congressman SMITH, and I hope that you will keep him in Washington as long as he cares to remain.

In assembling here today for the purpose of dedicating this building we are marking another milestone in the history of Centralia's postal service, which dates back to the establishment of the local post office on October 10, 1857. At that time this office was known as Skookumchuck, Thurston County, and our records indicate that Charles Van Wormer was the first postmaster to serve this community. This office was later changed into Lewis County, although it was not until January 11, 1884, that its name was changed to Centralia.

On an occasion of this kind I feel it is appropriate that I talk to you on the subject of the United States Postal Service, which, as we all know, played such a prominent role in our early history, and which has continued to form a very necessary link in the later development and expansion of the entire country.

This new Federal building which we are dedicating today is one of several hundred new post-office buildings that have been and are now being constructed throughout the country under the present administration's post-office building program. During the past 3 years Congress has provided funds for more than fourteen hundred new post-office buildings throughout the country. Eight hundred and forty-six of these buildings have been completed or are in the course of construction, and it is anticipated that the remaining projects will be placed under contract within the next few months. Every State, Territory, and insular possession shares in this vast building program, and I need not inform you of the tremendous impetus that this program of President Roosevelt has given to the building, heavy industries, and allied trades. It has resulted in thousands of men receiving employment, both at the site of construction and in the production of the raw materials that have been used in the buildings.

It is true that a lot of money was spent and is being spent in worth-while projects and emergency employment, which, to a great extent, has helped in establishing new markets for your products here in the Northwest as well as every other section of the Nation. Our adversaries never tire of pointing out the extent of this expenditure. One would think from their wails and groans that the money had been loaded on scows, towed out to sea, and dumped into the depths of the ocean. Actually, of course, this money went into the arteries of trade, into pay envelopes. A lot of it is represented in the bank deposits and in investments that those bank deposits made possible. It was not wasted and is still working to the benefit of our whole economic system. Without it, we would have had a picture very different from that presented today.

All of you can remember the miles of idle factories, the armies of jobless men, the crashing banks, and the business failures of the period of the depression. Do you think that any price was too great to pay for freeing this country of the horror of that time?

I need not inform you of the new sane and far-reaching prosperity that has been reborn in this country. For the whole country is faring just about as well as Washington. I haven't time to talk about what the C. C. C. camps have done for your State—I mean what they have done in addition to preventing thousands of boys becoming tramps and in building up their mental and physical strength, until nowadays the alumni of the Conservation Corps are in demand by employers everywhere. Instead of being an alarming liability, these young men have become a great asset to our Nation. I haven't time to talk about the protection of your forests, steps taken to prevent soil erosion, or of the many new public buildings, and miles and miles of good roads that have come to you as a byproduct of the processes of the recovery.

This particular project here in Centralia was authorized under the act of Congress of August 12, 1935, at which time $98,000 was allotted for the acquisition of a site and construction of this new post-office building here in Centralia.

This new building will result in the residents of this community receiving better mail service than they have had at any time in the past because of the enlarged and improved facilities, while at the same time it provides ideal working conditions for those public servants who work within its walls.

Reverting to the subject of actual postal service, the United States Postal Service is the largest and most important single business enterprise to be found anywhere in the world, and it is generally regarded as one of the most efficiently administered of all business enterprises, either public or private.

There are more than a quarter of a million men and women regularly engaged in handling the mails, and they are organized into various divisions of the Service so that all mail moves from sender to recipient in the most expeditious way. A major share of the credit for the efficiency of the system must go to these capable, conscientious, and loyal officials and employees.

Since the early colonial days it has been the policy of successive Government administrations in this country to keep extending and improving and modernizing the facilities for intercourse and commerce and communication among the people. In a very large degree our Nation owes its greatness to this policy. Without satisfactory means for travel and for the interchange of goods and information the Colonies could not in the old days have established that community interest, could not have reached that unity of spirit and that national sentiment which made possible their successful war for independence. Without these things the Thirteen States could never have been welded into a single people. Without them our country could never have reached its high place among the nations of the world.

In this age we have the telegraph, the telephone, and the radio. But the Postal Service remains, as it has always been, the backbone of our system of communication, and the Government's policy is to keep it modern and efficient. The construction of this post office and of similar post offices at other towns and cities which are included in the Federal building program is a part of that policy.

The happiness and prosperity of the entire country is definitely interwoven with the successful operation of the postal establishment, although the average person has but scant knowledge and information as to its operations and far-flung ramifications. It appears to him to go on automatically in a matter-of-fact manner after he deposits his mail in the letter box and little does he realize the tremendous amount of work and planning that enters into the transmission of a single letter.

A great deal is being said these days about Government in business. It is quite a controversial subject. Be that as it may, the United States Postal Service is the one business which is carried on by the Government with unanimous approval.

As a business enterprise, it is, perhaps, unsurpassed in the extent and scope of its operations. It has more than 45,000 offices, and a highly trained force of approximately a quarter of a million employees. We handle some 20 billion pieces of mail annually, and render numerous special services to the public. These involve hundreds of millions of transactions, and the collection and disbursement of billions of dollars in money.

The Post Office Department is rendering a service which, although an indispensable governmental function, is paid for by the public in the same manner as you pay for services provided private concerns, except, of course, that the Postal Service is not conducted for profit. While its primary purpose is the receipt, transportation, and delivery of the mails, it carries on other activities necessary to complete the regular functions of the mails, such as the registration and insurance of letters and parcels, and the C. O. D. facilities.

The Postal Service may be regarded as a huge enterprise owned by all the people to whom its executives and its employees are responsible. This big business should be conducted on a sound financial basis, that is to say, the postal revenues, which embrace the money derived from the sale of stamps, postage paid on matter which may be mailed without stamps affixed, and the charges for various other services, should cover the cost of postal operations.

The Post Office Department wound up the fiscal year 1931 with a net postal deficit in round numbers of more than $98,000,000, the fiscal year 1932 ended with a net postal deficit of more than $152,000,000, and there was a net postal deficit in the fiscal year 1933 of more than $50,000,000. The deficit for 1933 was incurred notwithstanding that at the beginning of that year the postage rate on all first-class matter was raised from 2 to 3 cents, which increased the revenues of the Department approximately $75,000,000. The present administration assumed office in March 1933, 4 months before the end of that fiscal year and too late to exercise any marked effect on the finances of the Department for that year.

The fiscal year 1934 was the first full year of operation under this administration. At the beginning of that year the postage rate on local first-class matter was reduced from 3 to 2 cents. This reduction resulted in an annual loss of more than $20,000,000 in revenue. With postage receipts for the year $900,000 below the receipts for the previous year, the Department showed a net postal surplus of more than $12,000,000.

The fiscal year 1935 was ended with a net postal surplus of approximately $5,000,000.

The 40-hour-week law and the transfer of the custody of post-office buildings from the Treasury Department to the Post Office Department brought an increase in expenditures of $60,000,000 during the fiscal year 1936. Notwithstanding, the year ended with a net postal deficit of less than $17,000,000.

Reports which I now have before me in Washington indicate that for the fiscal year 1937 another net postal surplus will be shown.

Some critics have pointed out that while surpluses were shown for the fiscal years 1934 and 1935, the Department drew substantial sums from the Treasury to meet expenses in those years. In this connection, let me remind you that large sums were also drawn from the Treasury during the fiscal years 1931, 1932, and 1933, and that these sums, like those drawn from the Treasury during the fiscal years of this administration, were to cover the cost of services rendered free by the Department under law or at less than cost, or to pay aviation and merchant-marine subsidies which the law required to be paid through the Post Office Department.

It was after taking credit for such so-called nonpostal items that the previous administration showed deficits ranging from $50,000,000 to $152,000,000 a year, and it was after taking credit for such items that this administration has shown annual surpluses, with the exception of the fiscal year 1936, when the 40-hour-week law and the transfer of the custody of post-office buildings from the Treasury Department added $60,000,000 a year to the Department's expenses.

In conclusion, I would like to leave one thought with you. Whenever you enter this building, whenever your eye falls upon its attractive exterior, let it be a reminder to you of the power and dignity of the United States, of the undying principles which animate our Government, and of the determination of President Roosevelt to serve the common good.

The Postal Service

EXTENSION OF REMARKS

OF

HON. JAMES M. MEAD

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Wednesday, December 1, 1937

Mr. MEAD. Mr. Speaker, the Postal Service has been operated in a most businesslike manner during the past 4 years. In other words, without any change in bookkeeping methods, a net deficit of $152,000,000 in 1932 was reduced to $50,000,000 in 1933, and became a surplus of $12,000,000 in 1934, a surplus of $5,000,000 in 1935, a deficit of $17,000,000 in 1936, and a surplus which will equal approximately a million dollars a month for 1937.

In balancing the postal budget, savings were effected in the leasing of buildings and by constructing annexes and substations as well. Savings were also effected by the consolidation, since March 1933, of nearly 7,000 rural routes. A reduction was effected by this administration in the subsidies both to domestic and foreign air-mail contractors and also in the marine subsidies. The latter are now a charge against the Treasury, through the Maritime Commission. Savings have been effected in the purchase of trucks and supplies, as well as in the increase in personnel efficiency. Revenue income has also been increased, mainly through the levy of 3-cent postage.

While the postal budget has been brought into approximate balance during recent years by added revenues, increased efficiency, and administrative savings, the Department has been burdened with new costs. The 40-hour-week law, the transfer of the custody of post-office and Federal buildings to the Department, the new services rendered other departments by the postal system, including the sale of Treasury bonds and hunters' stamps, the payment of the soldiers' bonus, the work associated with the launching of our Social

Security program, and now the work incidental to the unemployment census, are some of the added services required of the Post Office Department; and yet with it all the postal revenues are in approximate balance, which is a remarkable tribute to the administrative and the postal personnel. It is all the more remarkable when we consider the huge losses incidental to the operation of our second, third, and fourth-class mail services. The Department for the fiscal year 1936, according to the cost ascertainment figures, lost $90,000,000 in handling second-class mail, $23,000,000 on third-class mail, and $18,000,000 on fourth-class mail. If the Department could eliminate the free services, the subsidies, and require each classification to pay the cost of the service, the postal budget would be balanced without 3-cent postage. A satisfied public, a prudent administration, an efficient personnel, a cooperative Congress, have produced the Nation's most successful public enterprise.

THE WORK OF THE BOARD OF DIRECTORS, AS THE POST OFFICE COMMITTEES ARE CALLED

In the last session there were 750 postal bills presented to Congress. This averaged four bills a day, most of which were referred to the Post Office Committees. Included were private relief bills for claims against the Department; bills relating to the construction and maintenance of post offices; bills dealing with every phase of the postal activities, including the use of the mails, rates, classifications, regulations, postal facilities, and the pay and working conditions of postal employees. Five hundred of these bills dealt directly with the operation of the Postal Service, and 10 of them were enacted into law and approved by the President. Six of those approved related to compensation and employee working conditions; two concerned postal rates; one provided payment to temporary postmasters at the small offices in cases of emergency; and one was for the purpose of classifying certain bills and statements of account as first-class mail matter.

Ten postal bills which passed the House are still awaiting consideration in the Senate Post Office Committee. Nine of these relate to employees, one to experimental air-mail service.

Four House postal bills are on the House Calendar, and concern air mail, compensation for fourth-class postmasters, and the illustration of United States postage stamps.

Two House postal bills are on the Senate Calendar and may be considered early in the next session. One extends air-mail mileage and the other affects the compensation of postal laborers.

Four Senate bills approved by the Senate are still to be acted upon by our House committee. These bills affect the consolidation of rural routes, protection of the mail monopoly, extension of second-class mail privileges to publications of certain State departments, and the punishing of senders of threatening communications.

The President vetoed one postal bill during the last session which had for its purpose the status of star-route carriers.

During all the time these measures were receiving consideration, the committees of the House and Senate were aware of the friendly cooperation of all parties interested.

EXPANSION IN UNITED STATES AIR MAIL SERVICE SINCE 1933

In the fiscal year 1933 the northern transcontinental route extended no further west than Billings; today it extends from Chicago to Seattle, giving fast, through service to the entire Northwest.

The States of Maine, New Hampshire, Vermont and West Virginia had no air-mail service in 1933; those States now have direct service. In 1933 the Territory of Hawaii had no air-mail service, whereas now all of the major islands of the Territory are connected by means of route AM–33. In Alaska, where the airplane service is performed under star-route authorization, we have 18 air-mail routes at the present time giving service from twice a week to once a month, and the Department is now advertising for additional service by air from Juneau, Alaska, to White Horse, Canada, and from White Horse to Fairbanks, Alaska.

There has been a complete renovation of equipment since 1933. At that time there was not a single Douglas, Electra, or any of the newer model Lockheed multimotored planes in operation, which types are now predominant in the high-speed trunk-line service which we have today.

Our domestic air-mail routes in 1933 covered 27,679 miles; today they cover 31,991 miles and serve 47 States. The amount of mail transported over these routes has increased from 6,741,788 pounds to 19,553,543 pounds, and the mail revenue from $6,116,441 to $12,000,000. In 1933, 304,289 passengers were transported, bringing in a revenue of $6,407,748. This year 918,662 passengers were transported at a revenue of $21,508,325, while the express carried has grown from 744,452 to 6,845,275 pounds in the same period.

Our foreign air-mail routes show the same satisfying results. In 1933 the length of the routes was 18,898 miles; this year it is 29,955 miles. The mail volume has increased from 166,705 to 384,695 pounds; the miles flown from 3,775,454 to 4,445,590 miles; and the passenger-miles from 22,589,926 to 56,975,000.

In looking over the record of the Department of Commerce for the period 1933 to 1937, it is noted that a number of new mail stops were established; approximately 249 beacons, 43 landing fields, and 41 new radio stations set up, and some 42 of the earlier and more obsolete type of radio stations were rebuilt. Also, the teletype weather reporting system has been extended about 8,000 miles, from 13,000 miles in 1933 to 21,000 miles in 1937.

THE TRANS-PACIFIC AIR SERVICE

A few days ago, November 24, the *Hawaiian Clipper* left San Francisco to begin the third year of the trans-Pacific service. America's first transoceanic air-mail service has been in operation for 2 years and is without parallel any place in the world. It is the only over-the-ocean passenger-carrying service that exists. It has completed 162 scheduled flights without a forced landing or accident of any kind, covering 1,288,773 miles in regular service, or 96 percent of its scheduled mileage. This indicates that America has made greater progress in commercial aviation than any other nation in the world.

The trans-Pacific service has increased its mail volume this year over that of last year by 173 percent. The first year it carried 954,730 letters; the second year it carried 2,608,246 letters, doubling, almost tripling the first year's performance. More than half a ton of mail is being carried weekly from California to China by air, or about 230,000 letters every month.

The passenger service is increasing. Nearly 2,000 persons flew the Pacific in the past year, a record of some 7,931,312 passenger-miles.

The cargo-carrying department shows even bigger figures. Since schedules were started across the Pacific the clippers have carried 505,944 pounds of cargo in addition to passenger and mail loads. Serum and other medical supplies have been rushed across the ocean to the Orient; news reels of the bloody conflicts now being waged in China have been flown to the States; practically everything that could be put aboard has been sent by air.

Amend the Revenue Act of 1936 With Regard to Undistributed-Profits Tax Now

EXTENSION OF REMARKS

OF

HON. ALFRED F. BEITER

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Wednesday, December 1, 1937

Mr. BEITER. Mr. Speaker, recent newspaper dispatches indicate that employment in the steel industry has been slashed to about half of that of last Spring. In Lackawanna, N. Y., the Bethlehem Steel Co. has dropped some 8,000 men from the rolls. The same firm in Dayton, Ohio, has dropped some 26,000 men, resulting in the industry's lowest production in 3 years.

We do not want to permit this period of industrial recession to result in collapse and another depression. Building and real-estate operations must be revived if we are to restore normal economic conditions in the country. Repeal of the surtax on undistributed profits is widely advocated, and leaders of the House and Senate have given assurances that such legislative action can be expected. It appears, however, that the action to be taken by the Congress will be postponed until January. I want to take this opportunity to urge that action be taken now.

One of the large manufacturing firms in my district writes me regarding the effect of this tax on his business as follows:

It has been very destructive in its action because of the fact that on account of the severe depression our working capital was sadly depleted and it is necessary that it be built up for two reasons. First, to put us in good financial position. And second, to provide extra funds to carry us through the next depression, which is sure to come, as depressions do come. We have been obliged to replace several of our machine tools recently and to buy additional new ones. In addition to this we have been obliged to make extensive repairs because of our inability to do these things during the depression. We have an investment of over $1,600,000, and when we are busy we employ about 400 men. Therefore, the management has a double responsibility; that is, the responsibility to stockholders and responsibility to employees in order to keep our plant in a healthy condition and to carry on development work necessary to expand our business. There are thousands of companies in like condition.

Another large construction company in my district writes thus:

Corporations do not, as a rule, object to paying their stockholders reasonable dividends, but the management is faced with the necessity of building up a strong financial condition, as well as providing money for improvements and expansions. To a very large extent this is the way that many great corporations have been built up. I might mention United States Steel, Bethlehem, General Electric, and many others who have also paid reasonable dividends.

My bill (H. R. 4594) designed to ameliorate the tax on undistributed profits, has been pending in the Ways and Means Committee since February 10, 1937. The provisions of the Revenue Act of 1936 do not permit deductions for expenditures for improvements. My bill would permit deductions for payments made in liquidation of a debt for construction or other improvements over a period of years. I am firmly convinced that enactment of this legislation would develop a great volume of private construction, thereby furnishing private employment to great numbers of workers and relieve the Government of large expenditures in developing work at public expense for the unemployed. A petition to bring the bill out on the floor for immediate action is on the Speaker's desk and I urge those who are interested in obtaining action now to sign this petition without delay.

Relations Between Employers and Employees

EXTENSION OF REMARKS

OF

HON. IRA WALTON DREW

OF PENNSYLVANIA

IN THE HOUSE OF REPRESENTATIVES

Wednesday, December 1, 1937

RADIO ADDRESS BY HERBERT M. SYME, ATTORNEY FOR THE PENNSYLVANIA UNEMPLOYMENT COMPENSATION BOARD

Mr. DREW of Pennsylvania. Mr. Speaker, under leave to extend my remarks in the RECORD I include the following radio address by Mr. Herbert M. Syme, attorney for the Pennsylvania Unemployment Compensation Board:

It is difficult to find a cure-all in social and human problems. I believe that the greatest contribution that can be made to a solution of our industrial problems is a better understanding by employer and employee.

Let me enumerate some of the difficulties that have been presented in my experience in industrial matters.

Employers say that labor must be responsible, that unions are arbitrary and unreasonable in their demands; they do not consider the employers' plight.

Unions say the employer is hardheaded, obstinate; that he won't give in and won't try to understand.

What of the closed shop? How about the check-off? How about discharge cases? What are you going to do with these things?

Some of these questions are answered by the National Labor Relations Act. Some are not. Legislation has outlawed the company-dominated union. It has said to an employer that where a majority of his employees indicate a desire for a particular labor organization he must deal with that organization as the exclusive bargaining agency with respect to wages, hours, and working conditions.

It has said to that employer that he may grant the closed shop, but it is not obligatory upon him to do so. After that he must bargain in good faith. Bargain in good faith is a very sensitive, delicate, and difficult subject.

We have legislation providing for certain things, and a great many employers are willing to go as far as the law compels them. Organized labor, however, in most instances wants the employer to go far beyond what is required of him by law.

The important thing, I believe, is the desire on the part of both sides to try to understand the problems and establish a mutuality of understanding.

Labor must live up to its contract; must live up to every commitment it makes. That is also true of the employer. The difficulty is that contracts in early labor relations were negotiated merely as a gesture of good faith, never as legal instruments, enforcible in court. Notwithstanding that, the United Mine Workers, American Federation of Hosiery Workers, International Ladies Garment Workers, Amalgamated Clothing Workers, building trades, and various other unions have a long and honorable record of living up to their contractual obligations.

With the rapid growth of the labor movement, a labor leader may have crept in here and there who does not appreciate the responsibility he bears. But that may also be true of employers.

With new procedures established and new laws passed, labor leaders will have some tribunal other than the picket line to go to, and there will come a change in strategy.

Although a minimum wage may be established by law, the problem of wages will still agitate employer-employee relationships. Then there are small grievances that, notwithstanding their smallness, may be a source of trouble. I recently had an experience where an employee in a specialist dress shop insisted on eating garlic. He was a good man; he served the company faithfully; but still he ate garlic. The company wanted to discharge him, but felt the union would object and label such action as discriminatory, not against garlic eaters but against union members. The matter was adjusted. There are a multitude of such instances where someone outside the employer and employee should be brought in. Especially is this true in new unions.

The United States Department of Labor and the State department of labor have had men and women as mediators who have tried to do their best and in many instances have performed a commendable job in adjusting labor industrial controversies. But they have many handicaps. First, they are undermanned. Secondly, they are individuals frequently coming into strange territory, not knowing and not being able to influence either employer or employee.

For a number of years now individual localities have adopted systems of mediation. Toledo has a plan of that kind. Philadelphia for some time had such a plan. New York has recently passed an act that provides for such a plan of mediation. Newark has a similar plan.

How do these boards work? The boards consist of an equal number of representatives of labor and employees. In other words, the outstanding and most enlightened industrialists in a community are recruited to serve on the board with the outstanding and most enlightened labor leaders. The board usually has an impartial chairman, who represents the public and who usually holds the balance of power.

That is all there is to it. You get a hearing before such a board usually by writing a letter or making a telephone call. The members of the board are men in a local community. They have a local responsibility. They have been born, they live and probably will die in the community. They are interested in the continued welfare of the community.

An enlightened employer talking to another employer can accomplish a great deal more than either a government agent or a labor leader. On the other hand, an experienced labor leader, who has gone through many a fray and has solved many an economic problem, can do far more with his colleagues than can any other person. In addition to this, there is the problem of arbitration. Neither labor nor industry wants compulsory arbitration. But there are instances where both sides may say, "Let us submit this issue to an impartial tribunal and be bound by the decision handed down by it."

The older and stronger unions spend each year thousands and thousands of dollars on arbitrators, but the younger and weaker unions do not have the wherewithal, and the result is that very frequently they hunt for an arbitrator, cannot get a suitable person, and industrial strife results. The local community can supply a great many persons who would be willing to serve without compensation. If necessary, compensate them. In the long run it would cost the city much less than strikes cost.

Another difficulty in our employer-employee relationships has been the fact that we become conscious of a difficulty only at the time a strike arises. Then we see in screaming headlines that John Doe broke Richard Roe's skull and that Mary Smith stripped Bessie Jones and that a hearing will be held before a magistrate the next morning.

Industrial relations, however, should be looked into before they break into strikes, before they get on the front page. We should have not only a hospital of industrial relations, but also a convalescent home. We should have an industrial clinic.

I have been in conference with several Congressmen and I proposed a national mediation plan of this kind. I proposed that a single body be established in Washington for the purpose of setting up, directing, and coordinating local boards of this kind all over the country. Uniformity of policy would be established by the national board. It would have its representatives sitting on every one of these mediation boards. Labor and industry would be recruited from each community. Newspaper and radio support would be enlisted to corral public opinion.

The employer who under such circumstances would not act in good faith, or the union that would not act in good faith, would not have the legislative whip over it but would have the full force of public opinion. In Toledo, for instance, two newspapers actively support the plan and that city, which was strife-torn for a number of years, has established relative peace.

There is one fundamental principle that should never be lost sight of. We can safeguard labor's right to organize. That has to be done. But collective bargaining as such, the question of bargaining in good faith; that sensitive and delicate approach to a problem and an earnest effort to solve it, can never be legislated into existence. That is a subjective approach. And in that respect, society must take a hand and a good-neighbor policy must be adopted.

These bipartisan boards would bring about an interchange of opinions and a method of solving problems. They would initiate research to establish the status of a particular industry. The wages and the working hours might be investigated so that both sides would not work blindly as they do today.

The older unions have done a fine job in that respect. The Hosiery Workers Union recently spent $10,000 for a survey of the industry. The hatters have done a similar work. The mine workers are constantly investigating economic conditions.

When it comes to the weaker unions, newly organized unions, the unions where most of the trouble arises, the problem is more difficult and that should be a source of concern to society.

The Farm Bill

EXTENSION OF REMARKS

OF

HON. WILLIAM A. ASHBROOK

OF OHIO

IN THE HOUSE OF REPRESENTATIVES

Wednesday, December 1, 1937

COMMUNICATION FROM FRED BRENCKMAN, WASHINGTON REPRESENTATIVE OF THE NATIONAL GRANGE

Mr. ASHBROOK. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following communication which was sent to Members of Congress yesterday by Mr. Fred Brenckman, Washington representative of the National Grange:

THE NATIONAL GRANGE,
Washington, D. C., November 30, 1937.

To the Members of Congress:

There are certain features of the farm bill, H. R. 8505, now pending in the House, with which the National Grange is in full accord. We believe that, broadly speaking, the soil-conservation program is sound and should be continued, and we favor the objectives outlined in the declaration of policy contained in the bill, particularly with reference to giving the farmers price parity with other groups and a fair share of the national income. We likewise favor that feature of the House bill which would make $10,000,000 available each year for research in the effort to find new uses for farm products in industry and to extend markets and outlets for farm commodities. Another new feature of the bill which meets with our approval is that which would authorize the Secretary of Agriculture to intervene and cooperate with farm cooperative associations in rate cases coming before the Interstate Commerce Commission.

However, we are strongly of the opinion that the new legislation should be based on the idea of voluntary cooperation on the part of the farmers, rather than compulsory control on the part of the Government. It should be clearly understood that under no circumstances does the Government have the right to use the word "must" when it comes to telling the farmers of the country how much or how little they should produce of any particular crop, or how much or how little they should place upon the market. There can be no such thing as a majority, under the guise of a referendum, dictating to a minority in matters of this kind.

The provisions relating to compulsory control, quotas, and penalties contained in Senate bill S. 2787 violate all the best traditions of American democracy. If this bill should be enacted, it would lay the basis for perhaps 100,000 lawsuits in the agricultural States of the country every year. So far from being a help in the solution of the farm problem, there is justification for saying that the enactment of this measure would further complicate the situation and render the plight of the farmer more desperate than ever.

It should be remembered that Congress has a responsibility regarding the constitutionality of legislation that is enacted, as well as the Supreme Court. If such a measure as the Senate bill should pass and in due time the Supreme Court, in the performance of its sworn duty, should declare it to be unconstitutional, it would simply furnish an excuse for certain elements to raise a hue and cry that would resound throughout the agricultural sections of the country to the effect that the Supreme Court is the enemy of the farmer. That would not be fair to the Supreme Court, nor would anyone be benefitted by it.

In the opinion of the National Grange, both House and Senate bills should be referred back to committee and stripped of their compulsory features. In planning a long-time program for agriculture, we should not begrudge the time nor the patience that is necessary to make it sound, workable, and constitutional.

Yours sincerely,

THE NATIONAL GRANGE,
By FRED BRENCKMAN,
Washington Representative.

Reciprocal-Trade Agreements—Shoe Industry

EXTENSION OF REMARKS

OF

HON. WARREN R. AUSTIN

OF VERMONT

IN THE SENATE OF THE UNITED STATES

Thursday, December 2 (legislative day of Tuesday, November 16), 1937

ARTICLE BY HON. HENRY CABOT LODGE, JR., IN THE BOSTON ADVERTISER, NOVEMBER 28, 1937

Mr. AUSTIN. Mr. President, I ask unanimous consent to insert in the RECORD an article by the junior Senator from Massachusetts [Mr. LODGE], published in the Boston Sunday Advertiser of November 28, 1937, entitled, "Shoe Industry Must Have Pact Delay."

There being no objection, the article was ordered to be printed in the RECORD, as follows:

SHOE INDUSTRY MUST HAVE PACT DELAY

[By HENRY CABOT LODGE, JR., United States Senator from Massachusetts]

(Written expressly for the Boston Sunday Advertiser)

(Last week Senator LODGE introduced a resolution calling on Secretary of State Hull to suspend all further negotiations for reciprocal-trade agreements for 1 year so as to maintain employment and prevent involvement in European war zones.)

(Copyright, 1937, by the Boston Sunday Advertiser)

When a cotton sheet factory closes or a shoe factory shuts down, there are doubtless many reasons for it. But you will often find that one reason is that cotton sheets or shoes have come into the United States from foreign countries which sell so cheap that they undersell the articles which we make here.

These foreign goods—be they sheets from Japan or shoes from Czechoslovakia—sell at low prices because the help in Japan or in Czechoslovakia are paid a low wage and are worked for long hours.

If we Americans want to stay in business, keep our jobs, and meet this competition, there are two things we can do. We can either cut our wages to the Czechoslovak level, raise our hours, and lower our standard of living, or we can pass a law which will keep these substandard goods out of the United States.

Throughout our history we have chosen the second course. We have refused to cut our living standards to those of pauper-paid foreign labor. We have instead had a tariff law which set up a barrier which protected us against this type of foreign competition. The existence today of many of our industries would not have been possible without that tariff law.

OFF IN OPPOSITE DIRECTION

Today Secretary of State Hull and others propose that we go in the opposite direction. They say that we should make agreements

with foreign nations to lower our tariffs and let in more foreign goods. Then, they say, the foreigners would buy more American goods. It sounds like a wonderful theory.

They tell us that the old system of making tariff laws was bad. I agree.

As a newspaperman, I observed the making of a tariff law. I have seen the logrolling. I have seen the way in which tariff protection was given merely as a device to raise prices in industries which deserved no protection at all. I have seen the abuses of the old system. They prevented a healthy foreign trade, which means increased sales of American goods. They kept prices to the consumer artificially high. I agree wholeheartedly with Secretary Hull and his supporters that the old system of congressional tariff-making was bad.

We should therefore look at any proposal to change this system with a friendly eye. We can go a step farther and agree with Secretary Hull that it is a fine thing for us to sell our surplus production abroad and that, of course, we therefore must buy those foreign goods which we do not produce at home.

CASE OF PRACTICE VS. THEORY

The purpose of getting away from the old logrolling tariff system is a fine purpose. And the purpose of conserving and strengthening our legitimate foreign trade is a fine purpose. And the purpose of promoting peace and goodwill is a fine purpose.

So far, so good. We can agree on these aims. Let's see the method. How does the Secretary of State propose to achieve these aims?

One way which he intends to use is that of making an agreement with Czechoslovakia. Let us study this idea. It will show how different actual practice can be from beautiful theory.

1. In Czechoslovakia they make furniture and shoes and other things. They make many of the things which we make in Massachusetts. Recently Czechoslovak shoes were offered for sale in this country at $1.17 a pair.

Think of the low wages that must have been paid to make that low price possible.

A reduction in the tariff on shoes may be the deathblow to our Massachusetts shoe industry. The tariff on shoes is too low already. Several million pairs of Czechoslovak shoes came into this country last year. We should raise the tariff on shoes—not talk of lowering it.

2. Now, consider this: We are trying to raise wages. We are trying to shorten hours. We have a government which tries to do many things for its citizens and this means heavy taxes. Our national budget is out of balance. Therefore we have a big national debt.

And all these factors create an upward spiral which raises our costs.

3. Other countries have not followed our example where hours, wages, and taxes are concerned. Consequently their costs are lower.

4. We are told over and over again that one of the main purposes of this new policy is to promote peace. We presume that this means peace for the United States. Now, look at your map of Europe. See where Czechoslovakia is—right in the heart of the armed camp on the world's most celebrated battlefield—continental Europe. With war looming as large as it does today, how does it promote peace for us to increase our trade relations—and hence the chance for friction and involvement—with people in that part of the world?

5. Trade agreements have been concluded between the United States and 16 nations—all of them within a space of time so recent that their exact effects cannot yet be ascertained. Should we not see how these have resulted before going further?

TIME TO PAUSE IS NOW

These five points deserve consideration. It is, of course, easy to find fault—and so I do not merely criticize. We can readily admit the faults of the old system and the undoubted worth of the stated purpose of the new policy. We do criticize some of the methods which it is proposed to use.

And we submit that the time has come to pause * * * to go slow * * * until we can see the effect of wage legislation; of hour legislation; and of tax legislation. We simply cannot raise our costs at home and lower our defense against low costs abroad—and expect to have any industry left. We cannot go in two different directions at once.

Therefore, let us wait for a year, when we can make agreements more intelligently because we may then know the facts.

It is true, as Secretary Hull says, that we are all consumers who buy food and clothes and household goods and that it is a fine thing for consumers to pay low prices. That is true. But the intelligent consumer does not want prices so low that they can only be the result of sweatshop wages. The intelligent consumer does not buy foreign-made goods at prices so low that his neighbor is thrown out of work. We must not run the risk that this will happen.

Let us wait. Let us wait until we can see the results of the 16 agreements now in effect. Let us wait until the war clouds blow away. It is sometimes better, in the words of the old adage, "to make haste slowly." Let us wait for a year. If you go ahead now, you may add still more men and women to the tragic army of the unemployed. We merely want the chance to work. Do not deny us that chance.

The Unsolved Problem of Monopoly

EXTENSION OF REMARKS

OF

HON. WILLIAM GIBBS McADOO

OF CALIFORNIA

IN THE SENATE OF THE UNITED STATES

Thursday, December 2 (legislative day of Tuesday, November 16), 1937

ADDRESS BY HON. HOMER S. CUMMINGS, ATTORNEY GENERAL OF THE UNITED STATES, NOVEMBER 29, 1937

Mr. McADOO. Mr. President, I ask unanimous consent to have inserted in the Appendix of the RECORD an address delivered a few days ago by Attorney General Cummings on the subject of the Unsolved Problem of Monopoly. I think it is a very illuminating address.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

Mr. Chairman, members of the Associated Grocery Manufacturers of America, ladies and gentlemen, you have invited me to discuss a subject that is highly controversial and beset by difficulty. What I shall say represents merely my own viewpoint and grows out of my personal experience. A frank expression of opinion may, perhaps, be of some help in this vexing business. The title of this address, "The Unsolved Problem of Monopoly," is a recognition at the outset that, despite long years of debate and controversy, a satisfactory solution has not been found. And yet the need of a remedy is increasingly insistent.

Whatever else may be said of our antitrust laws, they represent an honest attempt to preserve democratic processes. With the objectives of these laws, I assume that few responsible persons have any serious quarrel. To forbid monopoly, to preserve free competition, to insure fair trade practices, and to prevent the price range of commodities from getting beyond the reach of the consumer, these and related purposes are at once worthy and of the essence of democracy. Yet, manifestly, our antitrust laws, admirable in design, and, within certain areas, reasonably successful, have failed of their major objective. They may have checked the growth of monopoly, but they have not prevented it. And, let me add, that unless we destroy monopoly, monopoly will find ways to destroy most of our reforms and, in the end, lower the standards of our common life.

The trend toward an undue concentration of wealth and economic control is unmistakable. It is estimated that in 1929, 200 nonfinancial corporations controlled 49.2 percent of the assets of all such corporations. In 1933 the percentage had increased to 56 percent. Reports from the Bureau of Internal Revenue for 1933 indicate that nearly one-third of all the property passing by death was found in less than 4 percent of the estates. The studies made by the Brookings Institution in its 1929 report indicate that 6,000,000 families had incomes of less than $1,000 annually, and that 36,000 families in the high-income brackets received as much of our national income as 11,000,000 families with the lowest incomes. Reliable statistical information discloses that large numbers of industrial units have totally disappeared, and that there has been a progressive elimination of the small businessman as a factor in American life.

If this is what democracy comes to, then we must amend our ways or confess judgment in the face of the world.

Competition, as a restraining influence, is being gradually displaced and in large areas remains only as a shadowy reminder of conditions that once existed.

Its illusory nature is well illustrated by the futile attempt upon the part of the Government itself to obtain competitive bids in a wide range of materials. The law requires the submission of sealed offers pursuant to detailed instructions duly advertised, and awards the contract to the lowest responsible bidder. These offers are handled with the utmost care and impartiality. Finally the critical moment arrives and the bids are opened. They are found to be identical. The whole proceeding degenerates into a farce. Not so long ago, the Denver office of the Bureau of Reclamation received 17 bids for reinforcement bars. Of these bids, 14 were identical to the last cent. When the Navy Department opened 59 bids for steel pipe, each and every one of the 59 companies bid precisely $16,001.83. In one instance, in purchasing cement, 40 companies bid each precisely $17,148.60. Substantially this same experience has recurred in bids for paper, rubber, meat, rope, office supplies, cans, chemicals, medical supplies, plumbing, explosives, and other materials without end.

It would not be feasible within the limits of this address to consider the legal aspects of this situation. I reserve such discussion for another time and place. My purpose is to call attention to the fact; and to ask you, What has become of competition

in the sense in which it is generally used? No one can claim, I suppose, that these identical bids were the result of identical costs of production, or the result of calculations based upon independent estimates. Whether they grew out of round-table conferences or more subtle devices which it is claimed defy prosecution, the result is the same. If such a result can be attained within the law then our prohibitions relative to collusion are aimed at methods and not at results; and yet results are the things with which we, as a people, are chiefly concerned. If a result harmful to the public may not lawfully be achieved by one method but may be reached by other means held to be legal, we are confronted by a judicial paradox difficult to resolve. Manifestly, private action, voluntary in character, which sets in motion a chain of circumstances producing frozen price levels is, from the standpoint of public interest, as offensive as arbitrary price fixing by a private monopoly. No matter what mechanism the Government—Federal, State, or local—may set up to assure price competition in public buying, it may, with reference to a large range of materials, be completely set at naught by ingenious devices of control which, it is contended, have not yet been brought clearly within the purview of our law.

Moreover, the complexities of modern existence and the pressures of events have undoubtedly had their effect upon the antitrust laws, their interpretation, and their administration. If you look at the statutes, do you find the law? Not at all. Only the simple expect to find the law in the statute books. The law must be searched out, as if it were a quarry in the tangled underbrush of an almost impenetrable forest. The courts have interpreted and reinterpreted the law and have, from time to time, laid down doctrines of a modifying and even self-contradictory nature. It is a case of "confusion worse confounded."

When the Sherman Antitrust Act came before the Supreme Court in 1895 in the famous Knight case, it was held that the sugar refining business of the country "bore no direct relation to commerce between the States or with foreign nations." It is hardly to be doubted that this decision devitalized the Sherman Antitrust Act to a marked extent, and for many years thereafter monopolistic practices went forward under judicial sanction. We have come a long way since that time, as you may readily see by comparing the reasoning in the Knight case with the reasoning of Chief Justice Hughes in the Jones & Laughlin case.

The Congress, after 24 years of experience with the Sherman Act and its judicial interpretations, passed the Clayton Act and set up the Federal Trade Commission. Following 20 years of experience with this form of procedure, we came to the period of the National Recovery Administration, the establishment of which was due, in part at least, to the relative inadequacy of the antitrust laws. Its period of existence was, however, so brief that it is impossible to say what the ultimate effects would have been had it not been declared unconstitutional.

The Robinson-Patman Act, the Miller-Tydings bill, and enactments like the Wagner labor-relations law, the Walsh-Healey Act, and the Guffey coal bill affect business methods in many essential ways, with resultants we have not yet fully appraised. In the meantime various decisions have been rendered by our courts which have tended to curb the power of the Federal Trade Commission and limit the scope of its useful activity. All these considerations lead to suggestions to which I shall later on refer.

ENFORCEMENT

Despite the difficulties and uncertainties to which I have alluded, there still remains an extensive area within which antitrust proceedings, even under existing laws and procedure, may be highly fruitful. This we have demonstrated by many successful actions dealing with such matters as unfair methods of competition, harmful restraints of trade, and ruthless suppression of small business by unethical methods. In fact, this administration during the 4½ years of its existence has instituted more antitrust suits than were commenced in any comparable period theretofore. Necessarily we in the Department of Justice take the law as we find it and enforce it to the utmost of our ability and resources. This is our plain and inescapable duty. This we have done and this we will continue to do.

Nevertheless it is literally impossible, with the limited personnel of the Antitrust Division, to give attention to every complaint or to prosecute all the cases that ought to be brought to the attention of the courts. Roughly speaking, it costs the Government not less than $100,000 per year to prosecute one sharply contested antitrust suit. Under the conditions that now prevail, it is only by working under extreme pressure that we are able to investigate the most urgent of current complaints and keep three or four large cases moving simultaneously. Moreover, the Department of Justice should be supplied with a staff especially qualified for economic analysis. Practically all of the difficult antitrust cases involve intricate economic and business problems. Manifestly no suit against an American enterprise should be instituted without the most careful preliminary investigation. No responsible person would desire the Department to file suits on popular rumor and suspicion without adequate check or preparation and without an eye to ultimate results.

My proposition is that the Antitrust Division of the Department of Justice should be more adequately implemented. Laws do not operate in vacuo. They do not achieve their results automatically. There must be behind them the driving force of the Government.

It is idle to pass new laws or to revise old ones without realizing that their administration is fully as important as their formulation, and that to enact ambitious laws and not to provide the means of their enforcement is to "keep the word of promise to our ear and break it to our hope."

CONCLUSION

In what I have said it has been my primary purpose to state a problem, to indicate roughly its outlines, and to stress its importance. Manifestly we have built up a body of law that is at once difficult to understand and well-nigh impossible of practical application in many of the urgent situations of modern times. A thorough overhauling of these laws is imperatively required.

This is necessary, not only from the standpoint of the Government and the public, but from the standpoint of business as well.

Naturally, I deprecate a slap-dash approach to the subject. In my judgment, there should not only be serious study, but extensive hearings, so that every interested element of our national life may be represented and so that it may not be contended that any legitimate factors have been ignored. Adequate consideration of the matter must of necessity cover a wide range of inquiry which should touch such subjects as mergers, holding companies, financial control, Federal incorporation or licensing, base-point bidding, price leaders, identical bids, patents, and taxation. It should run the whole gamut of our national life.

Competing considerations should be given their appropriate weight so that the resultant may gain general respect, for there is nothing in the world more futile than to enact laws which public opinion and the courts are not prepared to support.

We should determine how far wrongful intent is to be considered as a criterion when actual restraint of trade has been shown, and whether the so-called rule of reason requires redefinition. We should consider whether we are chiefly concerned with the form of competitive practices, or whether the accent is to be placed on the control of the supply and price of the product with the resulting mastery of the market.

A sinister intent is difficult to establish, whereas an economic result stares one in the face. The establishment of rebuttable presumptions, within reasonable limits, would tend to relieve the Government of many almost insupportable burdens in the matter of affirmative proof that now has to be drawn from reluctant or adverse witnesses.

Monopolistic practices could undoubtedly be more clearly defined. This would be helpful in the interest of enforcement, and would be a protection to those who honestly endeavor to comply with the law. Consideration might well be given to an increase in the authority of the Federal Trade Commission as an advisory body.

No doubt, in rewriting the antitrust laws, thought should be devoted not only to strengthening them and making them more intelligible, but attention should also be given to providing protection and encouragement to legitimate efforts of enlightened businessmen to increase production and employment, to improve working conditions, to eliminate waste, to provide more effective methods of distribution, and to supply better services to consumers and to the public. Nor should we overlook the fact that recalcitrant minority groups may, by ill-considered methods, impair or destroy the orderly conduct of business, with incidental injury to labor and to the public. The word "chiseler" has in modern times come to have a very definite meaning.

In short, the antitrust laws need clarification and restatement. They need to be adapted to our modern problems more realistically and intelligently, and they need behind them the drive of adequately financed enforcement machinery. Do not for a moment imagine that this is solely the Government's business. It is the problem of all of our people, and that includes every element of American life.

It must not be forgotten that we have found it necessary to set up an Interstate Commerce Commission to deal with railroads and other means of transportation. What has occurred in the utility field you are, of course, well aware. These developments were the direct result of indefensible practices that the average man deeply resented. The American people will not permanently tolerate monopoly or its evil fruits. Every business group understands this full well and, indeed, those who maintain conditions that are tantamount to monopoly are opposed to every monopoly except their own. Complaints under the antitrust laws almost invariably originate with businessmen and are directed against other businessmen. In this welter of things, nothing is more obvious than the fact that big business, if I may use that term, is moving blindly but with accumulating acceleration down the road leading to ultimate Government supervision. Indeed, there are those who are persuaded that economic groups that in one way or another have arrived at a position of dominance in any essential line of activity are likely candidates for regulatory treatment—and that this is especially true with reference to so-called natural monopolies or lines of business dealing with national resources. The problem has been so long with us that unless it is frankly considered and firmly grasped, it will get quite beyond control and lead to remedies of a character that few really desire.

The American people have a deep and abiding faith in democratic processes. They have seen the stop-look-and-listen sign passed all too often; but while their patience endures, every possible effort should be made to solve the problem within the terms of our political and economic ideals. Personally, I adhere to the faith that these difficult matters can be dealt with within the framework of our customary processes.

The very fact that this subject is being seriously considered by such a group as the one I see before me is a source of deep satisfaction and encouragement. Fundamentally, all our people

want to do the right thing. With courage and goodwill, and in a spirit of rank cooperation that excludes no helpful element of our national life, we may undertake our task with confidence.

The American System of Broadcasting

EXTENSION OF REMARKS

OF

HON. WALLACE H. WHITE, JR.

OF MAINE

IN THE SENATE OF THE UNITED STATES

Thursday, December 2 (legislative day of Tuesday, November 16), 1937

ADDRESS BY WILLIAM S. PALEY, CHICAGO, ILL., NOVEMBER 29, 1937

Mr. WHITE. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD a very informing and interesting address on the subject the American System of Broadcasting, delivered by Mr. William S. Paley, president of the Columbia Broadcasting System, at Chicago, Ill., November 29, 1937.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

I am particularly glad to have an opportunity to talk about the American system of broadcasting before this special group. As educators among a free people, you are familiar with the older tools of democracy and I know that you are keenly aware that a new one has been fashioned and that the manner of its use is of vital import to America.

We broadcasters, as custodians of a great means of mass communication, are eager to have you know what a driving force in our democracy it has become. We are eager to have you know, because we believe that if once you know you will see that he who attacks the fundamentals of the American system attacks democracy itself.

So my thesis today is that broadcasting functions democratically in harmony with the American pattern and, so functioning, has itself become an essential part of that democracy.

Broadcasting may be divided, somewhat arbitrarily, it is true, into three broad categories. The first is public affairs. The second, for want of more exact language, I shall call culture and education. The third is entertainment. In all three I shall trace the pattern that I have just defined.

If I were talking about broadcasting in the countries of the dictators, I should have a simple story to tell. In those countries broadcasting has been owned by the state and used by the state to mold the people to its will, with the people compelled to listen to what their rulers wanted them to hear and barred from hearing anything else.

In America it has been different. We were pioneers and there was no authoritarian hand to mark out a path for us.

In the beginning we stumbled and groped. We saw only dimly the possibilities of mass communication, the complex and often conflicting avenues that were open to us. We were new in a world that was changing and changing fast. Economic necessity was driving the man in the street, the man in the factory and the man on the farm to take a deeper and a more active interest in the public affairs and the politics of his country.

As more and more millions abroad were forced to lay their liberties on the altars of dictators, Americans, slowly realizing that democracy anywhere might be threatened and even lost, found themselves newly and intimately and deeply concerned with the drama of Europe and the chief actors in it.

While all this was happening, the evidence was accumulating that broadcasting could move the actions of men. People would listen, they would understand, and they would act. Living participation in the events of the world and of the Nation—events great and small—had arrived. Frontiers melted like mirages, cold type turned into the warm voices of real men; ideas, good and bad, traveled farther and faster.

Naturally, once so powerful a thing as broadcasting had proven itself, all sorts of people and all sorts of interests wanted to use it for all sorts of purposes. Manifold evidences of this desire forced us to think, to decide, and to act. Particularly in the realm of public affairs did we need, as we grew in experience, to develop a code of ethics. We were under a very compelling necessity to do our best. Public confidence and good will was the only thing we could rely on to perpetuate the system in which we believed. Seldom, if ever, has private enterprise had stronger motives for trying to serve the public interest. I come now to some of our major conclusions, the practices which flow out of them, and the reasons for them. Most fundamental in my own mind is this: Broadcasting as an instrument of American democracy must forever be wholly, honestly, and militantly nonpartisan. This is true not only in politics but in the whole realm of arguable social ideas.

To put it another way, we must never have an editorial page, we must never seek to maintain views of our own on any public question except broadcasting itself. Moreover, we must never try to further either side of any debatable question, regardless of our own private and personal sympathies. Of course, I do not mean that any broadcaster as an individual may not on occasion express his own views like any other citizen. I state this principle of nonpartisanship first, and I state it as emphatically as I can because I believe this is the cornerstone of democratic broadcasting.

You will perceive at once a striking difference between our position and that of the press. Let me point out the reason for that difference and at the same time try to clear up some of the confusion that has existed as to the meaning of such terms as "freedom of the air," "freedom of the press," "censorship," "editorial judgment," and the like.

I realize that having dwelt in the beginning on the power that lies in broadcasting I must offer logical evidence to back my conclusion that we ourselves must not use that power in the realm of controversial ideas, political or otherwise. Now, freedom of the press, as I understand it, means the right of the publisher or the editor to express any view he happens to hold on any public question, and even to refuse to publish the utterances of those who seek to controvert his views. He may even use his whole publication for the sole purpose of furthering his own ideas.

Why may the press be as editorially partisan as it pleases, while we may not? For the reason that there can be an unlimited number of publications devoted to countless purposes, whereas the number of broadcasters is rigidly limited for physical reasons and therefore an editorial attitude on the part of broadcasters would always carry with it the danger of one side of a vital argument being maintained preponderantly or even exclusively. If an editor's views are stodgy, or unpopular, or if he rides hobbies that bore most people, he pays the penalty of dwindling circulation, but he has violated no public obligation.

If you accept my definition of freedom of the press, let me next define freedom of the air as I and nearly all other broadcasters understand it. Freedom of the air means the right of a speaker to express any views he may hold on any question of general interest. He must be guarded, and he is guarded in that right, regardless of how the operators of network or station may themselves feel about the thing he discusses. If he is not libelous or otherwise unlawful, if he is not obscene, if he does not seek to provoke racial or religious hatred, he may say whatever he pleases over the air. I admit that ordinary questions of good taste or good manners sometimes arise, but virtually always they can be satisfactorily settled by consultation with the prospective speaker.

Right here I want to admit, too, that isolated instances of violation of this canon can be found. Most of them lie in what is for radio the distant past. Occasionally one is due to sudden emergency and lack of time for proper consideration; now and then someone, somewhere blunders.

I have given you a definition of freedom of the air. I have tried to show why it is not the same thing as freedom of the press.

The next great principle in keeping American broadcasting forever keyed to the needs of our democracy is "fairness of the air." By that I mean that no discussion must ever be one-sided so long as there can be found anyone to take the other side. The party in power must never dominate the air. No majority must ever monopolize. Minorities must always have fair opportunities to express their views. Again, because the number of broadcasters is limited by physical necessity and since, in the case of networks, millions listen at one time, it is imperative that all sides be fairly treated. Moreover, the dramatic velocity with which ideas reach the Nation through this new medium, the compelling attention gained by those who, in this modern way, contend in person in the public arena of thought and opinion, the degree to which our people have come to rely on the radio for first-hand contact with men and events, all thunder this same democratic moral of freedom and fairness. For us willfully or by the force of others, to do differently would be an unforgivable betrayal of the people themselves.

This discussion of fairness leads me naturally to the next cardinal principle evolved out of experience. Let me describe another and a costly policy maintained by Columbia and, I believe, by virtually all broadcasters as a further safeguard to the fair and democratic use of our medium. We sell time to sponsors solely for the advertising of their goods and services. We do not sell time for propaganda.

By propaganda we mean any attempt to influence legislation, regulation, taxation, and the like. Despite the tempting revenue we might have derived from such sales, we decided against them, first of all, because we believed it was part of our public obligation to provide time for the discussion of controversial issues.

An even more compelling reason was the danger that the side with the most money would win the argument, and often that special interests would drown out the voice of the public. Moreover, if we did sell time for such uses, the amount of talk on the air would be wholly dependent on the willingness and ability of proponents and opponents of issues to buy it. Obviously we could not sell time for such use to some and refuse to sell it to others, and thus we should be unable to maintain anything like program balance. The sole exception we make to this policy is the sale of time to political parties during an actual election campaign. This exception is made because the parties want to use, and are entitled to use, more time than we could possibly afford to give away.

What I have already said will, I believe, foreshadow what I shall now say about the field of education and culture. Democracy is a

pattern of living which great nations and very many millions of men have found worth while. It has been hard won and sometimes easily lost. It does not automatically maintain itself in 1937 any more than it did in the centuries of the past. Many men and many institutions must struggle constantly to preserve it, because unfortunately the thoughtless are apt not to know how precious a thing they are surrendering until it is already lost.

If I may venture my own definition of democracy, it is this: The ability of a people, provided they shall have free access to truth, to choose by instinct and understanding, by trial and error, that way of life which, with fairness to minorities, gives to the greatest number those things which they want. When I have said "access to truth" I have defined our policy with regard to culture and education. To the limit of public acceptance the broadcaster must be willing that the listener shall be exposed to all kinds of ideas on all kinds of subjects. It is his technical job to see that they are competently and interestingly presented because otherwise a twist of the dial renders his medium sterile. But he must not have ologies or isms or cults of his own favoring; he must not have his particular system of economics or his pet brand of science and seek to foist it on the audience. Rather, with constant heed to the demands of those he seeks to satisfy, he must search for that which is familiar and tried or that which is new and vital. He must look for those who know and those who do and bring them to his microphones whether or not he likes them or their ideas or their ways, satisfied, with democratic discipline, to let the people take what they can use and reject the rest. Continually the broadcaster, and all the creative agencies which help him, put on the air a variety of things which both arouse and satisfy listener appetite. It is a widely varied and a voracious appetite; it is often a fickle one. Sometimes it startles with swift response, sometimes it disappoints with the sluggishness of its reaction. Let him who seeks to force upon it too strongly his own ideas of "good" beware. An inconceivably assorted mass audience can be led, but we have yet to find a way to drive it; nor do I believe that we are entitled to drive it toward our own or anyone else's particular conception of what will "uplift" it.

Just as it is vital that we shall live up to these democratic ideals in the fields of public affairs and culture and education, if we are to serve, it is essential that we shall maintain them in the field of entertainment if we are to survive. I believe I do not even need to argue the right of the audience to be entertained. Entertainment, and particularly the free entertainment to which nearly every man, woman, and child in America has access through his radio set, is a fine thing in and of itself. I shall not dwell on the degree to which much of it is a vehicle for education, for enlightenment, for deepening perceptions, and rising appreciations. He who sits before the loudspeaker, within easy reach of switch or dial, is king. He likes some of everything and he is very vocal about what he wants. It is our job to find the best for him and to keep on bettering that best.

A few moments ago I mentioned program balance, and this reminds me that I wanted to explain what I meant by editorial judgment. So long as there is broadcasting, someone is going to have to decide what should be broadcast and what should not. These decisions are always going to be made by fallible human beings. Just as newspapers have editors who decide what to print and what not to print (there is never room to print all) so do we have staffs to decide what is worth broadcasting and what is not. We engage people of background and skill and experience, and we drill them in the principles I have been reciting. In special fields we do not try to exercise unaided judgment. Instead, we avail ourselves of competent advice. For example, we have both a child psychologist and a committee of qualified advisors to insure that all our children's programs conform to very high standards. We have a council of qualified clerics and laymen to allot fairly and sensibly the time we set aside for religious broadcasting, and our school of the air has a professional faculty.

Though I have narrowed my field of discussion to those phases which I thought would be of especial moment to you as educators, I would be sketching too inaccurate a picture of American broadcasting if I did not dwell for a moment on the stimulus of competition. Frankly, I think we have come a long way in a short time. Had we not rivaled each other, spurred each other, dared each other, we would not have done so well so quickly. We sit hourly before the whole people as our judges. None of us can let himself be outdone in the public service.

And so in a very concentrated way I have given you my observations about the form and the substance of broadcasting in this democracy. In the field of politics and public questions it has worked to develop public opinion that is better informed, more tolerant, and more rational. In a period which has registered the most radical social and economic changes in history, our people are understanding with greater clarity the complex problems and forces with which we are faced.

The general cultural level of our people has risen, but far more significant is the increasing aspiration toward better things. The great variety of daily broadcasts have all done their part to spread knowledge of the way men live, work, fight, play, and think in a mobile world. Broadcasting's contribution to the pleasure and happiness, as well as to the social and intellectual equipment of millions of people, is no less real because it has come to be taken for granted.

But of greatest importance is the fact that radio broadcasting has developed and used a democratic philosophy.

I have talked much today of democracy. It is a thing precious to us all. In broadcasting it has not been achieved without a struggle. The fight is not over, and it never will be. There will be danger from those who seek to lay rude and selfish hands on the medium. There will be even greater danger from those who are sincere and well-intentioned but know not the meaning or the value of the word I have used so often.

As solemnly and as sincerely as I know how, I repeat that our present American system of broadcasting, founded on freedom and fairness of the air, must be preserved and strengthened. Allow censorship to be imposed upon it, deliver it into the hands of autocrats, make it a tool of any party in power, destroy it, and you will have begun to destroy liberty in America.

The Farm Bill

EXTENSION OF REMARKS

OF

HON. ALBERT G. RUTHERFORD

OF PENNSYLVANIA

IN THE HOUSE OF REPRESENTATIVES

Thursday, December 2, 1937

Mr. RUTHERFORD. Mr. Speaker, let us give the dairy farmer a break. Coming from a section of Pennsylvania where dairying is the principal occupation of a great many of my constituents I am of the opinion that some provision should be made in the Agricultural Adjustment Act of 1937, which we are now considering, for their protection; and to that end I am going to vote for and support the Boileau and Andresen amendments to this bill when they are presented to this body. The Boileau amendment—which will make subsection (d) of section 2 of the pending bill read as follows:

(d) Any payment or grant of aid under subsection (b) shall be conditioned upon the utilization of the land, with respect to which such payment is made, in conformity with farming practices which the Secretary finds tend to effectuate any one or more of the purposes specified in clause (1), (2), (3), (4), or (5) of section 7 (a), and (except for lands which the Secretary determines should not be utilized for the harvesting of crops but should be permanently used for grazing purposes only) shall be further conditioned upon the utilization of the land, with respect to which such payment is made, so that soil-building and soil-conserving crops planted or produced on lands normally used for the production of cotton, wheat, rice, tobacco, or field corn shall be used for the purpose of building and conserving the fertility of the soil, or for the production of agricultural commodities to be consumed on the farm, and not for market. As used in this subsection the term "for market" means for disposition by sale, barter, exchange or gift, or by feeding (in any form) to poultry or livestock which, or the products of which, are to be sold, bartered, exchanged, or given away; and such term shall not include consumption on the farm. An agricultural commodity shall be deemed consumed on the farm if consumed by the farmer's family, employees, or household, or by his work stock; or if fed to poultry or livestock on his farm and such poultry or livestock, or the products thereof, are to be consumed by his family, employees, or household—

is just and reasonable. It certainly is not fair to the dairy farmers of America, to pay the farmers of our country raising wheat, corn, cotton, tobacco, and rice for taking acreage out of production of those crops and then allow them to use those same acres to grow agricultural commodities for market which will compete with the dairy farmer. All that the dairy farmer wants is a fair break from his Government. So far as I know he has never asked for any direct subsidy and if he has, he has never received any to date. The minority report on this bill states the situation clearly when it says:

The dairy industry received no benefits whatsoever from the operations of the Agricultural Adjustment Act or other New Deal legislation. Quite to the contrary, the dairy farmers of this country have been used as trading stock by the administration in the carrying out of its reciprocal trade policy. Tariff duties have been slashed on dairy products and foreign farmers encouraged to increase their production for shipment into the United States in competition with domestic production. During the first 9 months of 1937, 10,148,000 pounds of butter and 42,000,000 pounds of cheese produced in foreign countries entered our ports for sale in this country. In the same period, several hundred million pounds of competitive oils and fats were imported to be used in competition with dairy products. The effect of these importations has been to reduce the price received by American dairy farmers for their products with a consequent loss in purchasing power.

The reciprocal-trade policies of this administration have certainly been a "pain in the neck" to the dairy farmers of

this country, and if the Boileau amendment is defeated and the farmers now growing cotton, wheat, corn, tobacco, and rice be allowed to use their acres for the production of agricultural commodities which will compete directly with the farmers now engaged in the dairy industry, the dairy farmer will not only continue to have a "pain in the neck" but he will have received such a "kick in the pants" as to make him sore all over. The Andresen dairy amendments—reading as follows:

SECTION 1. The importation of agricultural products into the United States is hereby prohibited where the landed cost of such products plus the tariff duties are lower than the domestic cost of production.

SEC. 2. The Secretary of State is hereby directed to discontinue the practice of binding on the free list or binding at the present rate of excise taxes, agricultural commodities imported into the United States. The Secretary of State is further authorized to advise the Governments of Brazil and the Netherlands that at the expiration date of the respective trade agreements the concessions granted by the United States with reference to binding babassu oil and starches on the free list and freezing the excise tax on palm oil at 3 cents per pound will not be continued.

SEC. 3. That on and after 6 months from the enactment of this act, foreign shipments of dairy products into the United States are prohibited unless said dairy products have been produced from milk or cream of cows which are free from bovine tuberculosis—

are also fair and reasonable and should be adopted. Section 1 covers all farm products and simply gives the American market to the American farmer. Why this administration continues to favor the farmers in foreign lands in preference to our American farmers is more than I can understand. But it has been doing it for the past 5 years, and will continue to do so until the American farmer gets up on his hind legs and makes himself heard. Section 3 seeks to compel farmers in foreign lands who desire to ship their products into our country to comply with the same sanitary regulations and laws as are in effect for American dairy farmers. There is certainly nothing unreasonable or unjust in such a requirement. All the sanitary regulations and laws that have to be met by the American farmer before he can sell his dairy products costs him real money, and it is not only fair to him but to the general public to require that foreign farm products which are sold in competition with the American farmer should meet the sanitary requirements of our country. As set forth in the minority report—

The production of milk and dairy products is the largest agricultural business in the United States. As compared with the five basic commodities covered by the proposed bill for the 1936–37 crop year, the following figures tell the story: Milk, $1,761,000,000; cotton (lint and seed), $947,797,000; corn, $1,518,411,000; wheat, $624,338,000; tobacco, $269,061,000; rice, $40,730,000.

The above figures show that the dairy industry is the biggest agricultural business in the country today. It did not happen so. It took years of hard work and study on the part of the American dairy farmer to bring it to its present position. As I said before, all that the American dairy farmer wants is a fair break from the Government. Protect him from his enemies, both foreign and domestic, and he will go on his way rejoicing. Let us adopt the Boileau and Andresen amendments and show to the American dairy farmer that Congress has a real interest in his welfare.

Wage-Hour Bill

EXTENSION OF REMARKS

OF

HON. H. STYLES BRIDGES

OF NEW HAMPSHIRE

IN THE SENATE OF THE UNITED STATES

Thursday, December 2 (legislative day of Tuesday, November 16), 1937

LETTER FROM WILLIAM GREEN TO HON. MARY T. NORTON, IN THE NEW YORK HERALD TRIBUNE, NOVEMBER 23, 1937

Mr. BRIDGES. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD a letter from William Green to Representative NORTON on the subject of the wage-hour bill, published in the New York Herald Tribune of November 23, 1937.

There being no objection, the letter was ordered to be printed in the RECORD, as follows:

[From the New York Herald Tribune, November 23, 1937]

GREEN LETTER TO MRS. NORTON ON WAGE-HOUR BILL

WASHINGTON, November 22.—The text of William Green's reply to the request of Mrs. MARY T. NORTON, chairman of the House Labor Committee, for a restatement of the views of the American Federation of Labor on the wage and hour bill was made public today by the federation as follows:

"DEAR MRS. NORTON: You have asked me to state the present attitude of the American Federation of Labor toward the fair labor standards bill (S. 2475), as amended by the House Committee on Labor and now pending before the House Rules Committee.

"Your inquiry is also bound up with the present attitude of the American Federation of Labor toward the petition now pending in the House for required signatures to discharge the House Rules Committee so as to bring the fair labor standards bill on the floor of the House for action.

"The position of the American Federation of Labor on these inquiries is:

"'The American Federation of Labor is in accord with the purpose of establishing a point below which wages could not be paid and hours of labor beyond which wage earners could not be employed.' This quotation is from the declaration of the last convention of the American Federation of Labor on wage and hour legislation.

"On August 9, 1937, the American Federation of Labor stated as its position on the fair labor standards bill, as approved by the House Labor Committee, that the bill was 'reasonably acceptable and fairly satisfactory to labor.' This position must now be qualified to give effect to two new factors not then existent: (A) The recent experience since that date of labor, of governmental agencies, and of the public in the administration of the National Labor Relations Act, and (B) the serious and adverse changes in the economic and industrial life of labor and of the Nation, to which the President of the United States directed attention of the Congress in his special message of November 15, 1937.

"With trial and error as teacher, the Department of Labor, many Members of Congress, and the public generally have come to agree with labor that the administration of the National Labor Relations Act or other labor legislation by the National Labor Relations Board or similar independent governmental agencies is fatally defective. In the light of recent experiences, every effort should be made to protect the purposes of the fair labor standards bill from being thwarted by an administrative board of this kind.

"It is now apparent that such administration by the National Labor Relations Board has repudiated generally accepted concepts and disrupted tried and tested principles of collective bargaining between capital and labor. It has impaired and destroyed rights of contract and of property upon which labor has hitherto predicated its very existence and continued progress. Such administration has brought turmoil into industrial relations, has usurped the prerogatives of the courts essential to the preservation of our democratic form of government, and has jeopardized industrial freedom and initiative—all contrary to the clear intent of the Congress to create unrestricted opportunities for labor to organize, to strengthen bargaining agencies, to promote fair practices, and to foster the objectives of a more harmonious and stabilized relationship between labor and capital as part of the national policy for the general good.

"It is, therefore, generally recognized, and the American Federation of Labor insists, that it is no longer safe to permit a Government board of that kind to make the many determinations necessary in the administration of the fair labor standards bill as now written. Whether, for instance, collective bargaining is effective in a particular industry or whether collective-bargaining machinery is adequate in a particular case when predicated upon open, voluntary, and harmonious cooperation between employers and independent collective-bargaining agencies; to determine the proper units for purposes of collective bargaining; or to make the other numerous determinations permitted under the fair labor standards bill upon the precedents established by the National Labor Relations Board on the basis of interpretations of corresponding language in the National Labor Relations Act.

"To prevent a repetition of the confusion resulting from the Nation's experience under the National Labor Relations Act, many suggestions have been offered for changes in the wage and hour bill. The Department of Labor is now suggesting that the administrative machinery under the fair labor-standards bill be radically changed from that which it approved at the last session of the Congress, as embodied in the present draft. It now suggests that the administration of the proposed act be taken away from the proposed governmental board. Instead, it proposes that it be placed in the hands of a single administrator, who would be bound by the recommendation of committees composed of representatives of capital, labor, and the public.

"Former proponents of the bill in the Senate and Members in the House have suggested that the act should establish specified minimum wages and maximum hours with enforcement thereof by the Department of Justice or by the Federal Trade Commission.

"The American Federation of Labor can no longer endorse the draft of the fair labor standards bill now before the Rules Committee. It will not do so until the same has been revised, whether through the above-suggested amendments or methods, or through

others to be submitted by the American Federation of Labor, to preserve it beyond doubt and without possibility of distortion as the constructive force contemplated by the President's message of May 24, 1937, pursuant to which enactment is contemplated.

"Elaboration need not be made of the serious recession of business since the President's message of May 24, 1937, and the formulation of the fair labor standards bill now being considered.

"For labor this recession already has assumed the proportions of a serious depression. Unless prompt cooperative action is taken by the Congress, we are threatened with a duplication of the distress of the depression years following the collapse of 1929. The fair labor standards bill, as drafted, was not intended to and does not give effect to possible remedial steps to cope with the unemployment problem now upon us in aggravated form as a result of the present recession in business, and which it was assumed had been substantially met under the industrial improvement which took place during the spring and summer of 1937. For this special reason, the American Federation of Labor believes that the fair labor standards bill should be amended by incorporation of provisions therein for a shorter workday and a shorter workweek.

"Whether the petition now pending before the House for discharge of the Rules Committee to bring the fair labor standards bill before the House should be acted upon, and how, is a matter of procedure for each Member to determine as he sees fit.

"The American Federation of Labor feels, however, that the character of the changes to the present draft of the fair labor standards bill now before the House Rules Committee is such that proper consideration thereof can only be had before the House Labor Committee, where it was originally considered, rather than on the floor of the House. It feels, therefore, that the draft should be referred back to that committee for amendments or that a new bill be substituted. But whatever the procedure followed, and whatever is done, the present position of the American Federation of Labor with respect to the present draft and its future course of action remains as stated above.

"Very truly yours,

"WILLIAM GREEN.

"President, American Federation of Labor."

"1. The federation cannot and will not endorse the bill until it has been changed or amended to preserve its fundamental objectives, without possibility of distortion, as the constructive force contemplated by President Roosevelt's message of May 24, 1937.

"2. Recent experiences with the National Labor Relations Board and the present business recession have compelled the federation to qualify its position of last August that the bill was "fairly satisfactory to labor."

"3. The federation feels as a result of the administration of the National Labor Relations Act by the National Labor Relations Board that it is no longer safe to permit a Government board of that kind to make the many determinations necessary in the administration of the fair labor standards bill as now written. * * * It is now apparent that the N. L. R. B. has repudiated the generally accepted concepts of collective bargaining, impaired rights of contract, usurped the rights of courts, and brought turmoil into industrial relations.

"4. Because the unemployment problem is rapidly becoming more serious as a result of the present business recession the federation believes the bill should be amended to provide for a shorter workday and a shorter workweek. * * * Elaboration need not be made of the serious recession of business since the President's message of May 24 last because for labor this recession already has assumed the proportions of a serious depression.

"5. The federation feels that the basic changes necessary to preserve the objectives of the bill can receive the required thorough consideration only before the House Labor Committee and therefore recommends that the draft be sent back to that committee for amendments or for the substitution of a new bill."

Flood Control

EXTENSION OF REMARKS

OF

HON. H. STYLES BRIDGES

OF NEW HAMPSHIRE

IN THE SENATE OF THE UNITED STATES

Thursday, December 2 (legislative day of Tuesday, November 16), 1937

ARTICLE FROM BOSTON TRANSCRIPT, DECEMBER 1, 1937

Mr. BRIDGES. Mr. President, the problem of New England flood control has been very much in the foreground during the last year. I ask unanimous consent to have printed in the Appendix of the RECORD an article published in the Boston Transcript of December 1, 1937, purporting to give the general background in relation to this particular subject.

There being no objection, the article was ordered to be printed in the RECORD, as follows:

[From Boston Transcript, December 1, 1937]

NEW ENGLAND PREFERS FLOOD TO GRAB BY NEW DEAL—HERITAGE OF WATER POWER, LONG CHOICEST POSSESSION, NOT TO BE BARGAINED AWAY

WASHINGTON, December 1.—That the floods in New England were disastrous is now an old story. That the loss to New Englanders from the swirling muddy waters ran into millions is also an old story. It happened nearly 2 years ago.

Since then New Englanders have been seeking some way to control the levels of their streams and to protect their property during flood years. With the help of Army engineers and the cooperation of the New England Governors a feasible plan was adopted, a scheme whereby a series of earthen dams would control the level of the rivers, but more important still, New England would control the power produced by her rivers. This is the only plan that New England will ratify. Letters to Congress on the subject clearly reveal that floods, no matter how disastrous, are more welcome than the New Deal control of New England power.

HERITAGE OF STREAMS

This philosophy of independence, traditional to New Englanders, was not acquired overnight. Perhaps early association with the sea, which always breeds independence, has had something to do with it. When the first settlers arrived in the country they found a rough and rugged prospect. There was none of the large fertile fields, later developed in the West. The rugged hills of the North bore no minerals to enrich her native sons, and in the winter the snow lay deep for many months.

True, New England had her granite, her fish, and some timber, but these did not combine to produce her highly industrialized life of today. To a larger extent it was the swift, clear streams that were responsible for the New England wealth. On these streams New Englanders developed cheap water power, and with this power developed an industrialized community. Why otherwise would the cotton from the South or the wool from the West come to New England to be processed?

Mill towns—Lawrence, Lowell, Haverhill, Manchester, Nashua, to mention only a few—owe their birth and growth to the New England streams, the heritage passed down through the centuries to the New Englanders of this generation; a heritage which the New Deal has the will to destroy. Is it extraordinary that New Englanders refuse to sell this birthright, even for a mess of New Deal pottage?

COTTON PRODUCTION CUT

Figures from the Department of Commerce show that the United States now produces but 35 percent of the world's supply of cotton. A few years ago this country produced 65 percent.

Those opposed to the New Deal blame Mr. Wallace's A. A. A. experiment for the loss of this world market. The "plow under every third row" regime so reduced United States production that the world developed new cotton-producing areas in Brazil and British India. This year the United States has the biggest yield of cotton on record. High administration officials are keenly aware of the problem, but no one has any idea what New Deal sleight of hand experiment will be able to dispose of 10,000,000 bales of cotton without treading on a great many toes.

Perhaps the cat is out of the bag. The Senate Agricultural Committee produced a bill with no visible means of financing it. The President objected to that kind of a bill. The consumers seem to have learned from experience that a processing tax is, in reality, a consumer's tax on the necessities of life.

True, it is a tax paid by the manufacturer, but it is passed on to the consumer. The consumers are the voters, and by their recent actions the voters have shown they want no more taxes. The Agricultural Committee wanted to throw the perplexing problem of financing their bill over to the Ways and Means Committee, but they haven't been able to get away with it.

Sixteen Wasted Days

EXTENSION OF REMARKS

OF

HON. H. STYLES BRIDGES

OF NEW HAMPSHIRE

IN THE SENATE OF THE UNITED STATES

Thursday, December 2 (legislative day of Tuesday, November 16), 1937

EDITORIAL FROM THE MANCHESTER (N. H.) UNION, DECEMBER 1, 1937

Mr. BRIDGES. Mr. President, I ask unanimous consent to have printed in the RECORD an editorial published in the

Manchester Union of December 1, 1937, entitled "Sixteen Wasted Days," dealing with the present session of the Congress.

There being no objection, the editorial was ordered to be printed in the RECORD, as follows:

[From the Manchester (N. H.) Union, December 1, 1937]

Sixteen days have now elapsed since Congress was reassembled in special session. The depression, the product of fears provoked by New Deal policies and the economic consequences of unsound legislation, grows more menacing. The need of some official reassurance has been recognized by the President and New Deal leaders in a score of ways. But nothing practical is being done. The prices in both security and commodity markets continue to go down. The number of unemployed steadily increases. The question of relief for the destitute is again acute. Business everywhere is alarmed and discouraged.

And in the face of these conditions, which are overwhelmingly felt in the industrial centers, the Senate dawdles away its time, first on a sharply controversial antilynching bill, and then on a highly complicated farm subsidy bill, which is certain to increase living costs, if it works at all. Meanwhile the House squabbles over procedure relative to a wage and hour bill, which would set up a new dictatorship over industry. The constitutionality of both the farm bill and the wage and hour bill is challenged, and neither can possibly do aught at the present time but increase confusion in the public mind.

One of the favorite defenses of President Roosevelt and his New Deal advisers, when their revolutionary emergency measures have been attacked, has been that they were determined to prove that democracy could successfully function in national emergencies.

We are certainly in the midst of an emergency right now. The more than 2 weeks of futility and inaction, for which President Roosevelt and his overwhelming majority must accept responsibility, provide anything but assurance of swift remedial action in a crisis. This paralysis, in the presence of imperative need for action, however, does not indict democracy, but it does convict Roosevelt and his New Dealers of incapacity to understand the principles of democracy and give the institution of popular government a chance to function.

Take the two pieces of legislation, "must" legislation from the White House, the farm bill and the wage and hour bill, which engage the attention of both Houses at the President's orders. Are these a resort to the principles of democracy? They are not. The farm bill frankly sets up a system of compulsory control of farm crops, and the wage bill sets up a dictatorship over industry. Each one of them is a complete denial of democracy; each is a blow struck at free enterprise. And it is from such undemocratic measures as these that the President expects a sick business community to regain confidence and go forward.

Just to make the picture complete, the President chooses this particular time to go on a fishing trip in the delightfully tropic waters of Florida in order "to get away from it all." Those millions of American workingmen and businessmen who cannot "get away from it all" but have to stay at home and face hard, brutal conditions, do not grudge the President his frequent vacations, but they feel, somehow, that before he went away he might have tried to do something in the way of congressional action that would lend aid and encouragement to a harassed private industry upon which even he declares the country depends for recovery. Mr. Roosevelt must not forget that this is his depression. It was his policies which produced it, and he should do all he can to help get us out of it.

The Administration and Business

EXTENSION OF REMARKS

OF

HON. MORRIS SHEPPARD

OF TEXAS

IN THE SENATE OF THE UNITED STATES

Thursday, December 2 (legislative day of Tuesday, November 16), 1937

ADDRESS BY HON. JESSE H. JONES, AT THE OIL-WORLD EXPOSITION, HOUSTON, TEX., OCTOBER 14, 1937

Mr. SHEPPARD. Mr. President, I ask unanimous consent to have printed in the RECORD an address delivered by Hon. Jesse H. Jones, Chairman of the Reconstruction Finance Corporation, before the Independent Petroleum Association of America, at the Oil-World Exposition, Houston, Tex., October 14, 1937.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

Mr. Chairman and members of the Independent Petroleum Association of America, as one who for many years has watched the development of the oil industry with keen interest I am happy for the privilege of taking part in this celebration.

We are living in a rapidly changing era, and if a few decades ago anyone had ventured to predict the changes that have come about in our normal everyday lives in this short period he would have been classed with Jules Verne. Even the fantasies of Jules did not encompass the possibilities of science and invention. While great strides have been made in many other lines and the inventors seemed to have overlooked nothing, petroleum and its products have made the greatest contribution to the pleasure and convenience of people. Through the ingenuity of chemists and engineers in developing petroleum products transportation by every means has been developed seemingly to the *n*th degree both in speed and comfort. And the world wants to travel in a hurry and in comfort. If oil does not constitute our greatest industry, it is certainly an inseparable part of our greatest industry—transportation. It employs millions of people and billions of money and is a strong factor in the prosperity and welfare of our country.

Prospectors for oil are imbued with the same pioneering spirit that has developed this great Nation. The spirit that carried our civilization westward to the Pacific, built the railroads, developed water transportation, travel by air, and other improvements that have brought so much comfort, convenience, and pleasure to our generation.

So yours is an industry vital to the welfare of all, finding, conserving, and utilizing to the best advantage this great God-given natural resource.

I am glad to visit with you and to talk with you as one citizen to another. I do not assume to speak for the government, though it is from the background of more than five years in government that I venture to comment on national problems.

I am aware that many in business feel that the national administration is unfriendly to business. I am sure that it does not intend to be. The efforts of the President to bring about greater security for those who must work for a living, and against poverty and old age, are frequently mistaken for unfriendliness to business. The cost of this security must necessarily be levied against business and industry, and none in business likes to have the normal tranquillity of his operations upset or disturbed by new rules and new costs. Viewed from the standpoint of the welfare of all which must be our first consideration, and observing social, political, and business trends, I feel that if business will have a little patience with government in meeting these new problems, recognizing these trends and the responsibility of government, everything will work out all right.

Many new factors have entered into our business and industrial lives, and it will take some time for business and industry to become adjusted to these, but it undoubtedly will, and therein lies the necessity for patience and cooperation between business and government. I am aware that some in business feel that all of the cooperating is required of business, and none of it by the Government; but when business leadership shows a real willingness to recognize the principles of social security and to undertake the burden of financing it, government will, in my opinion, meet it more than half-way.

We must not forget that in running government every citizen, regardless of his station, is entitled to equal consideration, and that it is government's responsibility to protect the weak from the strong. We do not like to admit that the weak need protection from the strong, but we know they do. Human beings still have the spirit of dominance. You have it in the oil business. One trouble with the strong and powerful is that they don't appreciate how hard they hit or how ruthless they sometimes are without necessarily intending to be. To the fleetest goes the race, but we all have to eat. Most people in business and industry want to get rich, at least in some measure, and riches, of course, are relative. A few thousand dollars means riches to a great many. The vast majority want to make a living, and if possible to lay a little something aside for a rainy day. All too often we forget our early struggles when we reach a position of security and are inclined to drive on with not enough concern about how the other fellow gets along. I have seen so many broken, distressed, and humiliated men in the last 5 years that my sympathies go out to every insecure person. Social security within reason, and by a proper effort on the part of those secured, is right and we will be remiss in our duty if we do not try to achieve it.

We have come a long way under President Roosevelt, and it is not necessary to approve everything he does to recognize his great service to the country. No man can bat a thousand every day. Business was about as low as the proverbial toad when President Roosevelt took office. Business is good now. This could only have been accomplished through extraordinary procedure. Left alone, we might have gotten well in time, but there would have been much needless distress and suffering in the process. No one wanted that, and we were all crying for something to be done at Washington. The President put us in high, and we liked it. Now we are worrying about the cost, and we should worry about the cost, because the bill must be paid. A debt was incurred on behalf

of all the people, and all have shared in the benefits. The time has now come when many of these unusual expenditures should be discontinued and attention given to balancing the books. That is what I understand to be the purpose of the President.

The oil industry has perhaps had the greatest recovery of any business. We know what oil was selling at, and the condition of the business in 1932 and 1933. The President started out to give us dollar oil and succeeded. Great recovery has been achieved in other lines, but none as much as oil. I think it is generally agreed, and this exposition tends to prove it, that today the petroleum industry is one of the most progressive and prosperous in the world. When overproduction and related ills threatened to wreck the industry, you got together with the Government, State and National, to work out a solution. Times were bad and all realized something had to be done. Something was done, and it succeeded admirably. Our State regulation has been efficiently administered and effective. It has saved many millions of dollars for the industry, which enabled it to pay better wages, a better price for oil, and to make money. It has been equally helpful to the owners of the land from which the oil is produced, and has conserved this great natural resource.

In bringing order out of the general chaos large expenditures were made by the Government. The money to cover these expenditures can only come from taxes, and no one likes taxes. It is better, however, to make $2 and pay $1 of it in taxes than to make no dollars and still have to pay some taxes.

Last week in a speech before the convention of the supervisors of State banks in New York City, I referred to the continually falling securities market, and repeat here that I have been unable to find any good reason for the extent of the slump that has come about in the last few weeks. Commodity prices have also gone off, but bumper crops are responsible for these. It may be that we have an oversupply of securities, though in the great shake-out following 1929 inflated securities were pretty well squeezed out, and the present quoted prices seem low from an investment standpoint, that is if we still believe in our country, and of course we do.

Measures which the Government has taken through the Securities and Exchange Commission to protect investors have limited the operations of speculators, but it is probably still possible for them to influence the market up or down by a concerted movement. Whether any such movement influenced the present decline has not been determined. Unconfirmed reports have it that some such operations have been going on on the other side of the Atlantic where they have no capital gains tax and less stringent regulations. Whatever the cause we should all realize that it is better to make money by working for it than by betting on the rising and falling figures of the ticker tape or which horse can run the fastest. It is business—making, producing, and selling things—that constitutes the real economic strength of the country. The Securities Commission may be too restrictive in some respects, but it is one of the best laws that has ever been put on the statute books.

The most frequent reasons we hear as causes of the slump in the market for securities are "fear of the administration," "taxes," and "failure to balance the Budget." I know beyond question of a doubt that the President is determined to balance the Budget, and that all governmental agencies are being required to curtail and reduce their demands upon the Treasury.

The President has announced that no more P. W. A. grants or loans will be made. The Farm Credit Administration is no longer any considerable drain, nor is the Home Owners' Loan Corporation or Federal Housing Administration. These activities have played an important role in recovery and, with the exception of P. W. A. grants, will in the end cost the taxpayer very little. The Works Progress Administration is employing approximately a million less people than it was a year ago, and there are several hundred thousand less on local relief. The R. F. C. is returning money to the Treasury rather than drawing upon it, and we have quit lending except in extraordinary circumstances. Banks, insurance companies, and the Federal Reserve are amply able to meet all legitimate demands for credit.

We have an unusually large cotton and corn crop this year, 5 million more bales of cotton and a billion more bushels of corn than last year. Loans upon these are apparently necessary to prevent ruinous prices, and while these loans may be privately financed temporarily by the Commodity Credit Corporation, they will add to Treasury requirements and make Budget balancing more difficult.

As for taxes, it is well known that the Treasury is making a study of the entire tax situation with a view to recommending adjustments that will better distribute the tax burden. Taxes will, of course, continue high, and must needs be levied upon business, industry, and income, but should, and I believe will, be fairly distributed. I have no check of taxes in other countries, but we know they are very high and are being largely expended for military purposes rather than civil, as with us. Our government expenditures are to build people not to destroy them.

We hear more criticism of the undistributed-surplus tax and the capital-gains tax than almost any other Federal tax. I do not know to what extent these are under consideration by the Treasury or the Congressional committees that report on tax matters, but certainly the Treasury and these committees will have ample information of the objections to them by those most affected. Personally, I am inclined to the opinion that the principle of the undistributed-surplus tax is right in that it prevents undue accumulations which naturally tend to monopolies. Certainly provisions should be made for corporations in debt; otherwise a great many can never get out of debt, especially those who suffered most during the depression, and the little corporations. Some allowance should also be made for plant expansion and replacement, including equipment, modernization, and so forth, and corporations should be allowed to set aside some part of their net earnings as a reserve against contingencies without too much extra tax upon this reserve. I doubt if there will be any serious objection to some such adjustments, but it may be necessary to add something to the normal tax. This business can stand.

I have no fear that Government will tax business to the extent that there will not be a fair profit left. Undoubtedly the high brackets discourage initiative and investment by those best able to invest and take a risk. This phase of the tax situation should also be given consideration in whatever tax changes are undertaken, not for the purpose of lightening taxes on the rich, but to restore and preserve the incentive for initiative and investment. The hope of reward in every field of endeavor is our most effective spur.

It is not an easy task attempting to satisfy everyone, either in the matter of taxes or any other phase of government or business, but by cooperating in a spirit of friendliness and helpfulness, one with the other, government and business certainly can solve our problems, notwithstanding any seeming lack of compatibility.

Production of Basic Commodities in Relation to the Monetary Situation

EXTENSION OF REMARKS

OF

HON. ELLISON D. SMITH

OF SOUTH CAROLINA

IN THE SENATE OF THE UNITED STATES

Thursday, December 2 (legislative day of Tuesday, November 16), 1937

TELEGRAM FROM FRED H. SEXAUER TO HON. ELLISON D. SMITH, AUGUST 13, 1937

Mr. SMITH. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD copy of a telegram addressed to me on August 13, 1937, by Fred H. Sexauer, chairman of the monetary committee, National Cooperative Council, on the subject of the production of cotton and other basic commodities in relation to the domestic and foreign monetary situations.

There being no objection, the telegram was ordered to be printed in the RECORD, as follows:

[Western Union Telegram]

AUGUST 13, 1937.

Present plans to control farm production by the National Government before crop loans will be authorized fail to take into consideration certain long-range factors which may undermine the position of United States agriculture in world markets.

A nation producing a major portion of a world commodity can, by restricting production, create temporary scarcity and higher prices—until competing nations increase their production. Cotton is a typical basic commodity with a world market. What is true of cotton is true, in varying degree, of all other internationally traded farm commodities and basic raw materials.

The United States always held world dominance in production of cotton until 1933. In the preceding decade the United States produced, on the average, 57.1 percent of the world's cotton, and never fell below 53.4 percent. Beginning with 1933, United States production fell to 48.5 percent, 41.3 percent, 39.1 percent, 40.2 percent in the succeeding years.

	World bales	United States bales	Percent of world production by United States
1923–32 average	24,834,000	14,243,617	57.1
1933	26,106,000	12,664,000	48.5
1934	22,942,000	9,472,000	41.3
1935	26,641,000	10,420,000	39.1
1936	30,200,000	12,141,000	40.2

Two factors brought about this change. One was the policy of crop restriction; the other, the failure of the United States to adjust the gold value of its currency to the same extent that competing agricultural countries of the sterling area group did under the guidance of the British policy.

While the United States cotton crop remained stationary between 1932–36, Brazil increased 421 percent; Egypt, 95 percent; and India, 24 percent. Brazil, potentially our greatest competitor, increased from 347,000 bales in 1932 to 1,808,000 bales in 1936.

Between 1921 and 1929 a bale of cotton sold in any world market for an average of 5 ounces of gold. Then gold increased progressively in purchasing power until in 1932 and 1933 it took only 1.6 ounces of gold to buy a bale of cotton in any world market. Other internationally traded commodities fell correspondingly in exchange value for gold.

5.2 ounces of gold bought a bale of cotton from 1921–29.
4.6 ounces of gold bought a bale of cotton in 1929.
3.1 ounces of gold bought a bale of cotton in 1930.
2.1 ounces of gold bought a bale of cotton in 1931.
1.6 ounces of gold bought a bale of cotton in 1932.
1.6 ounces of gold bought a bale of cotton in 1933.
1.8 ounces of gold bought a bale of cotton in 1934.
1.7 ounces of gold bought a bale of cotton in 1935.
1.8 ounces of gold bought a bale of cotton in 1936.
1.5 ounces of gold buys a bale of cotton now in 1937.

Brazil took into account this change in the purchasing value of gold and reduced the gold content of its currency so that, despite the smaller number of ounces of gold receivable for commodities in world markets, the Brazilian producer received substantially as many milreis for his product as he received in the twenties.

The Brazilian price of gold has been increased to correspond to an American price of $47 per ounce against our $35. Therefore, when an American and a Brazilian cotton producer, for example, each sell a bale of cotton of the same grade and on the same day in Liverpool, the Brazilian producer receives a price 35 percent higher in milreis—in which he must pay his internal fixed charges—than the American producer receives in dollars. This gives the Brazilian producer competitive advantage which cannot be offset by crop loans made to American producers.

The failure of the crop-loan policy prior to 1933 was due to the failure to recognize that the forces to be dealt with were monetary forces arising out of the changeable purchasing value of gold. This is an inherent defect of a fixed gold standard which only intelligently managed currency system can, we believe, overcome.

Every policy that lifts the domestic dollar price of cotton, when translated into gold, holds United States cotton above the world gold value of cotton at the time, must check the flow of United States cotton into export markets. The difficulty is not lack of market, for the world consumption of cotton has increased from less than twenty-three million bales in 1931–32 to more than twenty-seven and one-half million bales in 1935–36.

The problem for the United States arises from the fact that Congress has failed to carry through the monetary measures that the sterling area agricultural nations have used effectively.

For a short period, in 1933, the United States applied the monetary measures of the sterling area countries. As we raised the dollar price of gold, the price of basic commodities followed, step by step, in almost mathematical exactness. Cotton rose from 6 cents to 11 cents between February and July 1933, corn from 22 cents to 52 cents; wheat from 50 cents to $1.07. Then this policy was abandoned in favor of restricting production by regulating agriculture and industry, with the underlying idea that prices could be raised by scarcity measures.

If this policy is continued, America's position as a producer of basic commodities will be further impaired. The production of basic commodities for world markets will be moved from the United States to other nations as the production of cotton has been during the past 5 years.

A loan policy on basic commodities is justified only as a temporary expedient. The safeguard should be a monetary policy that will give us normal prices with normal production.

Congress delegated to the President power to raise the United States price of gold to $41.34 an ounce. This would increase basic commodity prices, cotton, in particular, by 1.9 cents a pound; and would make reasonable crop loans safe.

In the sterling area countries, governments encourage high production. Their farmers plant more and are crowding United States growers in world markets. Yet, in consequence of sterling area monetary policies they receive profitable prices. This one underlying monetary force, intelligently used, has resulted in high building activity, high business activity, farm prosperity with high production, and more jobs than men, because the high buying power of farmers and basic producers has broadened the markets for the products of industry. These sterling nations are the most prosperous in the world.

We urge Congress to keep the ultimate monetary needs of the Nation in view in considering any emergency legislation intended to support falling markets.

FRED H. SEXAUER,
Chairman of the Monetary Committee,
National Cooperative Council.

Raising Prices by Law

EXTENSION OF REMARKS
OF
HON. EMANUEL CELLER
OF NEW YORK
IN THE HOUSE OF REPRESENTATIVES
Thursday, December 2, 1937

LETTER OF HON. W. A. AYRES, CHAIRMAN OF THE FEDERAL TRADE COMMISSION, TO HON. EMANUEL CELLER, REPRESENTATIVE FROM NEW YORK.

Mr. CELLER. Mr. Speaker, I recently pointed out to the Federal Trade Commission by letter the very wretched results brought about by the passage of the Miller-Tydings Act, the very bad price-fixing law. Its avowed purpose was to do away with the so-called loss leader. But the bill was worded in such a way as to lend encouragement to high retail prices at the highest levels. In fact, immediately upon the passage of this bill, the National Association of Retail Druggists campaigned to elevate prices to an extent of 50 percent of actual cost, regardless of the rapidity of the turnover of any article. This resulted in great harm to the consuming public.

I herewith submit a letter received from Hon. W. A. Ayres, Chairman of the Federal Trade Commission, acknowledging receipt of my letter of complaint, and indicating that the Federal Trade Commission is investigating various situations brought to its attention, involving resale price maintenance undertakings. The letter also indicates that the activities of the National Association of Retail Druggists are being investigated.

Not being satisfied with boosting prices, various groups have sought to dam up the channels of information and prevent the consuming public from knowing the truth.

I pointed out to the Federal Trade Commission—see Appendix of the CONGRESSIONAL RECORD, Seventy-fifth Congress, second session, pages 224 to 227—that certain groups were preventing the sale from newsstands of magazines that sought to give exact information to the consuming public concerning the activities of these groups in their campaign to raise prices. It has now also come to my attention that a very well-known magazine which had accepted and paid for an article entitled "Raising Prices by Law," and which (article) was to have appeared in the December 1937 issue of said magazine, refused to publish the article as a result of the blackjacking tactics on the part of those afraid of the disclosures in that article.

I am also informed that numerous retail associations in various lines of business likewise blackjacked wholesalers, distributors, and manufacturers into increasing the retail sale price of articles. This practice has become widespread, and can be directly traced to the Tydings-Miller act. The consumers all over the country are "paying the piper." It is a case of the "consumer be damned."

FEDERAL TRADE COMMISSION,
Washington, November 30, 1937.

Hon. EMANUEL CELLER,
House of Representatives, Washington, D. C.

MY DEAR CONGRESSMAN: This will acknowledge receipt of your letter of November 29, 1937, relative to the efforts of the National Association of Retail Druggists in the fostering of legislation to legalize the maintenance of resale prices and its subsequent alleged illegal price-fixing activities. I have read with interest and concern your observations and the implications set forth with respect to past and present policies of this association, in connection with which you point to specific instances of questionable activities that are being indulged in in an effort to make the same effective.

The Commission has been giving consideration to various situations as they are brought to its attention, involving resale price maintenance undertakings in their relation to the various State fair trade acts and the Miller-Tydings law. With respect to such activities of the National Association of Retail Druggists and its members, as are set out in your letter, you no doubt will be

interested to know that the same are already under investigation by the Commission.

In this connection it is noted that you have specific information and evidence in support of certain statements made by you which you indicate you are willing to furnish to the Commission. You may be assured that we will be pleased to receive for our information and use in connection with pending matters all material and information that you have available.

Yours very truly,

W. A. AYRES, *Chairman.*

One Hundred and Fiftieth Anniversary of the Starting of the Covered Wagon Trip to Marietta, Ohio, to Settle the Northwest Territory

EXTENSION OF REMARKS

OF

HON. GEORGE J. BATES

OF MASSACHUSETTS

IN THE HOUSE OF REPRESENTATIVES

Thursday, December 2, 1937

ADDRESS OF HON. GEORGE J. BATES, OF MASSACHUSETTS, DECEMBER 1, 1937

Mr. BATES. Mr. Speaker, under the leave to extend my remarks in the RECORD, I include the following remarks of myself at the banquet in Ipswich on December 1, 1937, commemorating the one hundred and fiftieth anniversary of the starting of the covered-wagon trip to Marietta, Ohio, to settle the Northwest Territory:

Mr. Chairman, distinguished guests, and friends, it has become my privilege at this time, as the Representative in Congress of the people of the Sixth Massachusetts District, to extend their greetings to this fine gathering and their best wishes for the greatest possible success to those conducting this Northwest Territory celebration.

One hundred and fifty years ago this month history was made in this town of Ipswich, when the Rev. Manasseh Cutler gave his blessing to the little party that commenced the famous wagon-team journey from Dr. Cutler's little church in what is now Hamilton, and this town also is fittingly marking this occasion only a short distance beyond the present boundary line of the two communities. You who are here tonight are probably familiar with the events that followed the tedious trek to Marietta, the first settlement in that great expanse of territory now comprising the great States of Ohio, Indiana, Illinois, Michigan, Wisconsin, and part of Minnesota. The importance of Dr. Cutler's and Massachusetts' contributions to settling this Northwest Territory cannot be stressed too much.

The Ordinance of 1787 is a condensed abstract of the Massachusetts Constitution that had become effective in 1780 and contained the principles of Government, that the Ohio company of Massachusetts were interested in having adopted. These principles were set forth in the original petition in the plans for settlement, in which Timothy Pickering, of Salem, took a leading part in drafting. Perhaps the most famous sentence in the entire Ordnance, with the possible exception of that which excluded slavery from the Northwest Territory, is a summary of the laws and customs of Massachusetts. That sentence reads: "Religion, morality, and knowledge being necessary to good government and the happiness of mankind, schools and the means of education shall forever be encouraged." Prior to Dr. Cutler's arrival at the session of Congress in New York, very little headway had been made in setting forth a form of government for the new Territory, he is therefore credited with having been responsible for the inclusion of that clause and other important features contained in the final draft of the Ordinance.

The Honorable Nathan Dane, of nearby Beverly, as Representative from the Essex District, was the member in the Continental Congress through whom Dr. Cutler directed his principal efforts for the final adoption of the Ordinance by the Congress. Of the provisions concerning "religion, morality, and knowledge," Mr. Dane some years later declared: "These selections from the Code of Massachusetts, as also the titles to the property, have created for her (Massachusetts) an extensive and lasting influence in the West, and, of the most republican, liberal, and beneficial kind." As the Code of Massachusetts was an important guiding force in the drafting of the Ordinance of 1787, so was it also in the framing of the Constitution of the United States which was adopted several weeks later.

Guaranties of human rights, in their broadest application, with equality before law, were introduced into the governmental structure in the Ordinance of July 13, 1787, "for the government of the territory northwest of the river Ohio." This ordinance marks the only time in the history of mankind, with a single exception, where the laws have been prepared and put into effect before a territory was occupied. It was the desire of Dr. Cutler and his associates in the Ohio company—formed in Boston on March 1, 1786, by officers of the Revolutionary Army, meeting in Bunch-of-Grapes Tavern for the purpose of purchasing land from the Government for actual settlement—that the territory should always remain a part of the United States under well-defined powers that could be immediately exercised. These ideas were incorporated in the draft of the Northwest Ordinance when finally passed unanimously by the Members of Congress gathered in New York.

As a result of Dr. Cutler's perseverance, the scheme of settlement itself was a broad and comprehensive one, covering the whole ground of a permanent occupation of that distant wilderness in the interests of a Christian civilization, or republican institutions founded upon the rights of man and supported by every civil and political safeguard. The Revolutionary War now being over, much unrest had arisen within the Thirteen Colonies, and there was fear of internal disorders among different factions. This was in the minds of those attending the Continental Congress in New York, and it was to this that Dr. Cutler pointed in stressing his proposal for expansion, and, he argued, there must be protection assured against the savages on the western frontier to help keep the 13 States together. By declaring that his company would buy land from Massachusetts, which then owned what is now Maine, if not permitted to settle the Northwest Territory, Dr. Cutler proved himself perhaps the original American lobbyist and succeeded in arousing enough sentiment in Congress to authorize the Ordinance of 1787 and the subsequent "greatest private contract ever made in America," as he called it in his journal, when on October 26, 1787, he paid over $500,000 to the Board of Treasury for the land northwest of the Ohio River.

In the words of William Frederick Poole in his historic writings a century after the signing of the famous ordinance: "The Ordinance of 1787 and the Ohio purchase were parts of one and the same transaction. The purchase would not have been made without the ordinance, and the ordinance could not have been enacted except as an essential condition of the purchase. * * * When considered together, every fact in the origin and passage of the ordinance is explained, and is found to be connected with the agency of Dr. Manasseh Cutler. He was the person of the most varied accomplishments, the widest learning, the largest personal influence, and the one most active and deeply interested in the subject matter of the ordinance of all who had a part in its formation. He was then 45 years of age, and in the prime of manhood and mental development. He later became a member of the Seventh and Eighth Congresses from this district. Dr. Cutler was a pioneer of the first order. The masterful work for which he is credited constitutes one of the very cornerstones on which was built this great Nation of ours, for it was Dr. Cutler who, through his tireless personal efforts, secured enough support in the Continental Congress for adoption of the Ordinance of 1787 on July 13 of that year. Only two other documents in our history are considered of more importance than this ordinance—the Constitution of the United States and the Declaration of Independence.

A fervent desire for greater freedom and security, away from the oppression and discontent of other lands, inspired each of those three great documents, which our forefathers made the fundamental law of this land so that we, of a later day, may live in peace and security. The pioneer spirit which was instilled in the minds of those founders of our country and its government is a spirit that seems in more recent years to have been ebbing. The present trend is away from constitutional democracy and alien theories and policies are today threatening our very foundations. Political influence and unhealthy competition in industry are endangering the future of this Nation for which those pioneer men and women gave their all.

The tendency to broaden the field of government and to centralize its authority may now be found in the changing attitude of the people themselves and the decay of that rugged American individualism of our forbears who established the American system of government. The frontier of forest and prairie which challenged the courage of the first Americans, who built their fortunes upon the soil has vanished, and now we see the industrial frontier receding. Uncertainty and experimentation, together with the creation of a fabulous national debt, stalk our industrial life and hamper expansion of its frontier.

At the time of the adoption of the Ordinance of 1787 and of Dr. Manasseh Cutler's memorable achievements there were less than 4,000,000 people in the entire United States, a population that now can be compared with that of Massachusetts alone. It is only proper, therefore, that we, as citizens of the United States of America, gathered here on the soil of Massachusetts, from which sprang the American tradition of freedom and hard-earned prosperity, should here and now resolve to do our utmost to preserve the form of government the early settlers sacrificed so much to establish.

The records of the past show the efforts of men and women to advance life and liberty and government and give all their true meaning. Today our problems are more complex than those of the fathers, requiring greater thought, a broader spirit, more

varied talent, more unselfishness, more cooperation, more heroic action. The heroism chiefly required of us today is to face our duty, to inspire patriotism and a sense of civic responsibility, to guard and to pass along to posterity the heritage of free government. Let us play our full part, faithful to the old traditions, faithful to the new tasks and duties of the day.

We Must Provide Jobs for Our Aged Workers

EXTENSION OF REMARKS

OF

HON. JAMES M. MEAD

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Thursday, December 2, 1937

Mr. MEAD. Mr. Speaker, the problem of finding a job which the unemployed worker over age 40 must face is becoming increasingly acute. No one knows how many individuals with long service records in industry and valuable training and experience are today in desperate need or on the point of becoming psychological wrecks because of hiring policies setting inflexible age limits. The innumerable individuals who write into the Government and lay their troubles and difficulties before us are for the most part the educated, highly skilled group. However, the problem is no less acute among the more-inarticulate, less-skilled group. An age-limit rule is less likely to be suspended in the case of an unskilled or semiskilled job—in which speed is the more important factor—than in the case of a position requiring some degree of maturity and judgment.

How many companies today maintain these fixed age limits for hiring? How many individuals, skilled and unskilled, men and women, are affected by them? What are the actual dimensions of the problems of the unemployed over 40? Only a very partial answer to these questions is furnished by studies made so far, and these partial results are extremely disquieting. For example, a study made in Massachusetts showed that 8 percent of the firms questioned employed no male workers 45 years of age or over. About half of the firms, employing two-fifths of the workers included in the study, employed less than their fair share of older workers.

A study made in New York in 1933 showed that 1 out of every 5 manufacturing concerns surveyed had adopted rigid maximum age hiring limits. A fourth of these firms with age discriminatory hiring policies fixed 40 years or lower, and 57 percent fixed 45 or less. Practically none admitted persons aged 55 or over, no matter how good their physical condition or background. In connection with this, one should bear in mind that the lowest age limit set for old-age assistance or insurance benefit is 65. This presumes that there will be employment opportunities for those not disabled up to that age.

Other questions which cannot perhaps be answered statistically but which confront us are: How great is the waste of human resources due to these policies? How great a burden do these policies throw upon the community, in the form not only of actual relief payments but of homes foreclosed, children deprived of education and training, lapsed insurance policies, unpaid taxes, and a break down in family morale due to the principle breadwinner's loss of job and loss of status. Unemployment among the groups 40 and over has economic and social implications which in some ways are even more serious than unemployment among other age groups. For these are apt to be people at the height of their responsibilities to their families and to their communities; and are also often people at the height of their individual powers. Perhaps they cannot hold their own on the assembly line against younger men, at the pace which industry requires of its workers, but there are many other ways in which a well-managed society could use their aptitudes and experience.

What are the causes behind these policies? It is frequently alleged that older workers cost the employers more in compensation premiums and cost the insurance companies more in compensation payments because injuries take longer to heal and are more apt to entail complications. Even if this were to some extent true, it might be offset by the possibility that older workers are less likely to be involved in accidents. A study of accident and compensation experience by age groups is urgently needed to throw light on this debated point. The bearing of State insurance funds versus private insurance carriers should not be overlooked.

Group life, or pension, insurance policies maintained by the employer are alleged as another source of age discrimination. If this contention proves to be correct, it will go far to offset any possible social good that could be traced to such plans. Perhaps the answer lies in expansion of our present social-security program, which aims at spreading the cost of providing for old age over the widest possible actuarial base.

In attacking this problem of age discrimination the part played by Government agencies and regulations such as those set up by Civil Service Commissions should come in for a share of the scrutiny. The governments, local, State, and Federal, ought to set the pace in observing high labor standards and fair employment policies; certainly we cannot advocate a double standard in this matter, particularly not a double standard which is lower for the Government than for private industry.

I introduced the following resolution, which has been referred to our Committee on Labor. Its approval by the committee will be of invaluable assistance in the solution of this problem.

[H. J. Res. 453, 75th Cong., 1st sess.]

Joint resolution to determine the nature and effect of economic conditions or statutory provisions tending to produce unfair or inequitable discrimination on the basis of age in obtaining and retaining employment in public service and private industry

Whereas the rapid mechanization of industry and other factors beyond his control make it increasingly difficult for the older worker to obtain and retain employment; and

Whereas this condition affects materially the well-being and comfort of a considerable number of our citizens and threatens our social structure, so that its alleviation and correction has become a matter of public concern; and

Whereas the economic difficulties encountered by the older worker has been lost sight of in the praiseworthy concern of governments for those who have passed the age of 65, and for the youth of the country; and

Whereas age is becoming, to a greater degree, an important and often controlling factor in determining the efficiency and compensation of men and women seeking or retaining employment: Now, therefore, be it

Resolved by the Senate and House of Representatives of the United States of America in Congress assembled, That the Secretary of Labor is hereby directed to investigate and report to Congress upon the nature and effect of any economic conditions or statutory provisions which may tend to produce unfair or inequitable discrimination on the basis of age in obtaining and retaining employment in public service and private industry; the extent to which age is a factor in determining the efficiency of men and women engaged in such public service and private industry; the effect of pension systems and group and workmen's compensation insurance upon the employment of the older worker.

That the Secretary of Labor is further directed to appoint a representative national advisory committee to act in connection with the planning of the study and to review the results of the surveys and to make appropriate recommendations.

That the sum of $50,000 is hereby authorized to be appropriated for the purposes of this resolution.

Northwest Territory—One Hundred and Fiftieth Anniversary

EXTENSION OF REMARKS

OF

HON. GEORGE A. DONDERO

OF MICHIGAN

IN THE HOUSE OF REPRESENTATIVES

Thursday, December 2, 1937

Mr. DONDERO. Mr. Speaker, by virtue of an act of Congress passed in 1935, a national celebration commemorating the one hundred and fiftieth anniversary of the passage of

the Ordinance of 1787 and the establishment of the Northwest Territory will begin December 3, 1937.

The most spectacular feature of this celebration will be the reenactment of the long journey made by the Ohio company, pioneers from Ipswich, Mass., to their first settlement at Marietta, Ohio.

It was on a brief and bleak December 3, 1787, that the first band of men, who had formed the Ohio company, left their homes in Massachusetts to begin the dangerous and hazardous trip to that little-known country situated north of the Ohio River and west of the Allegheny Mountains.

One hundred and fifty years later another group of men, specially selected and trained for the occasion, pioneers of our day, with ox team, pack horses, conestoga wagons, and other equipment of that Colonial time, will begin the long trek, following the original trail as closely as possible, to portray anew with historical accuracy, for nearly half of the Nation's population, the march that inaugurated the building of an empire out of the Northwest Territory.

This historic event is of particular interest to the people of the six States formed out of the Northwest Territory and of general interest to the Nation. It is of special interest to the people of my congressional district, the Seventeeth Michigan, and the people of Michigan, because much of the colorful history of early days in the Northwest Territory had its origin in what is now the southeast corner of Michigan. From the beginning the Detroit area was prominent in territorial history and development.

The old Northwest Territory constituted the first step westward by the United States in its march from sea to sea and in the development of the most self-contained nation in the world.

In the Ordinance of 1787, passed by the Continental Congress, is found not only the organic law of this first new territory, but also the fundamental principles for a government and a civilization new and unique in the progress of mankind.

Out of this territory have been carved six populous States wherein are located the second and fourth largest cities of the United States—Chicago and Detroit. These States, in the order of their admission to the Union, are: Ohio, Indiana, Illinois, Michigan, Wisconsin, and Minnesota. Only a portion, however, of what is now Minnesota was included in the Northwest Territory.

The history of the United States has been largely a story of the clearing of forests, the laying out of farms, the erection of homes, the construction of highways, the introduction of machinery, the building of railroads, and the rise of cities and towns.

In laying plans for the development of the western lands the statesmanship of the Revolutionary leaders was at its best. The seven States which had some sort of title to tracts extending westward to the Mississippi River wisely yielded their claims to the Nation. In the Ordinance of 1787 there was mapped out a plan of government admirably suited to the frontier.

On July 13, 1787, the famous Northwest Ordinance was set forth for the first time in unified form, the essence of American thought as to the relation of our Government to the rights of man—the crystallized expression of what America had fought for—the principles under which her people willed to live. On that date the Continental Congress in session at New York passed the famous ordinance to govern the Northwest Territory. One of the remarkable conclusions reached by that body and which they incorporated in that document was the eternal truth that no people could be happy or have good government unless they possessed religion, morality, and knowledge.

This national celebration will accomplish much if it merely causes our people to accord the Ordinance of 1787 its rightful place among the truly historic documents of the United States.

For the first time in any written American document the Ordinance of 1787 set forth the foundation for our American Bill of Rights. I quote some of its provisions:

"The estates, both of resident and nonresident proprietors in the said territory, dying intestate, shall descend to, and be distributed among, their children * * * in equal parts." "No person * * * shall ever be molested on account of his mode of worship or religious sentiments." "The inhabitants of the said Territory shall always be entitled to the benefits of the writ of habeas corpus, and of the trial by jury; of a proportionate representation of the people in the legislature; and of judicial proceedings according to the course of the common law. All persons shall be bailable, unless for capital offenses, where the proof shall be evident or the presumption great. All fines shall be moderate; and no cruel or unusual punishment shall be inflicted. No man shall be deprived of his liberty or property, but by the judgment of his peers or the law of the land; and, should the public exigencies make it necessary, for the common preservation, to take any person's property, or to demand his particular services, full compensation shall be made for the same."

"No law ought ever to be made or have force in the said territory that shall, in any manner whatsoever, interfere with or affect private contracts or engagements, bona fide, and without fraud, previously formed."

"Religion, morality, and knowledge being necessary to good government and the happiness of mankind, schools and the means of education shall forever be encouraged."

"There shall be neither slavery nor involuntary servitude in the said territory, otherwise than in the punishment of crimes."

While the Ordinance of 1787 was passed to provide a framework of government for a new western territory, it was also to serve as a repository of new concepts of government and as a guide to the framers of the Constitution, creating the United States of America. The Continental Congress supplied the Ordinance of 1787, which contained some of the fundamentals of the Constitution of the United States.

In 1776 the Continental Congress made a solemn promise to the men in the Continental Army to pay them in land for their services. The loosely connected and weak Continental Government, however, did not own any land. It was without money and without power to raise money. It could recommend to the States what should be done, but it was without power to enact or enforce its own recommendations.

It was through the shrewdness and foresight of the American delegates to the Peace Treaty of Paris that this Nation acquired title to the Northwest Territory from Great Britain—subject to the claims of Indian tribes and the claims of some of the Original Thirteen States.

Adjusted compensation to veterans was not unknown even 150 years ago. Immediately following the signing of the peace treaty with England, a petition signed by a large number—288—of officers of the Continental Army was presented to Congress asking that the promise made to them and to the men who fought for freedom in 1776 be fulfilled, and designated the lands between the Ohio River and Lake Erie, west of Pennsylvania, be allotted to them in settlement.

Each man was given a certificate for the amount of money to which he was entitled for his services and that certificate was received in payment of the land assigned to him. With General Putnam, trusted friend of Washington, at its head, the Ohio company was formed and "westward the star of empire took its way." Had Horace Greeley then lived, the advice he gave to young men more than a half century later to go West would have been received and acted upon with equal enthusiasm by the 47 men who left their homes in Massachusetts and blazed a trail to a new home in the wilderness beyond the Alleghenies 150 years ago.

While the fate of the Northwest still hung in the balance, emigration from Eastern States became the rage. The small farmer on barren acres covered with mortgages was eager to sell his homestead and begin life anew on the banks of the Ohio or Muskingum, and land companies painted glowing pictures of the West.

For a decade Ohio was the favorite goal; and within 8 years after the battle of Fallen Timbers this region was ready for admission to the Union as a State. Southern Indiana also filled rapidly.

The West not only called to broken-down farmers, bankrupts and ne'er-do-wells, but a public protest was raised against the "plot to drain the East of its best blood." Anti-emigration pamphlets were scattered broadcast. A rude cut which gained wide circulation represented a stout, ruddy, well-dressed man on a sleek horse, with a label, "I am going

to Ohio," meeting a pale and ghastly skeleton of a man, in rags, on the wreck of what had once been a horse, with the label, "I have been to Ohio."

The settlement of the Northwest Territory was retarded largely because of intermittent warfare with Indian tribes led and organized by two savage chiefs who possessed unusual power and organizing ability together with great leadership. These two savage chieftains who held back the settlement of the Northwest Territory and who organized their people to defend their hunting grounds were Pontiac and Tecumseh. Pontiac, Mich., the county seat of my home county, was named in honor of this mighty chieftain of the redman in recognition of his great ability as a leader of his people.

After the danger from Indian warfare was over, the main obstacle to western development was the lack of means of easy and cheap transportation. The settler found it difficult to reach the region which he had selected for his home. Eastern supplies and foodstuffs could be obtained only at great expense. The ever-increasing products of the western farms, maize, wheat, meats, livestock—could be marketed only at a cost which left scant margin of profit. The experience of the War of 1912 proved the need of highways as national defense as well as for moving products.

Despite these handicaps hundreds of transportation companies were running four-horse freight wagons between the Eastern and Western States; and in 1820 more than 3,000 wagons, practically all carrying western products, passed back and forth between Philadelphia and Pittsburgh, transporting merchandise valued at $18,000,000.

Both East and West became interested in internal improvements, and the Indian trails gave way to rough pioneer roadways and then to carefully planned and durable turnpikes. Long before the War of 1812, Jefferson, Gallatin, Clay, and other statesmen had conceived of a great highway, or series of highways, connecting the seaboard with the interior as the surest and best method of promoting national unity and strength. In the act of Congress of 1803, admitting Ohio as a State, 5 percent of the money received from the sale of public lands in the State was set aside for the building of roads extending eastward to the navigable waters of Atlantic streams.

In 1808 Secretary Gallatin presented to Congress a report calling for an outlay of $2,000,000 for internal improvements for 10 years; and by 1811 the Government had entered into the greatest undertaking of its kind in the history of the country. It was the building of a magnificent highway known to the law as the Cumberland Road, but familiar to the many emigrants, travelers, and traders—and deeply embedded in the traditions of the middle States and the West—as the National Road.

Starting at Cumberland, Md., this great artery of commerce and travel was pushed slowly through the Alleghenies, even in the dark days of the war, and in 1818 it was open for traffic as far west as Wheeling, W. Va. The method of construction was that devised by John McAdams in England, and involved spreading crushed limestone over a carefully prepared roadbed in three layers, traffic being permitted for a time over each layer in succession. This "macadamized" surface was curved to permit drainage, and extra precautions were taken in localities where spring freshets were likely to cause damage. Columbus was reached in 1833; Indianapolis about 1840; and the roadway was graded to Vandalia, then the capital of Illinois, and marked out to Jefferson City, Mo., although it was never completed to the last-mentioned point by Federal authority.

One is surprised when they read that the cost of construction amounted to $10,000 a mile in the neighborhood of Pennsylvania and $13,000 in the neighborhood of Wheeling, W. Va.

The National Road has long since lost its importance as the great connecting link of East and West. But in its day, especially before 1860, it was a teeming thoroughfare. Its course was dotted with farmhouses, fast-growing villages, and towns. Emigration followed this route into the Northwest Territory.

The year 1937 has a double significance to the people of Michigan, for we are in the one hundredth anniversary year of our admission into the Union as a State and we are participating in the one hundred and fiftieth anniversary of the Ordinance of 1787. The part that Michigan played has been an important one in the building of the Nation. It is most fitting that we pause here in the Congress of the United States to turn our eyes backward to the accomplishments of those who acted their part so well upon the stage of life in our allotted portion of the world.

What Shall Congress Do To Relieve Unemployment?

EXTENSION OF REMARKS

OF

HON. WALTER G. ANDREWS

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Thursday, December 2, 1937

RADIO ADDRESS OF HON. WALTER G. ANDREWS, OF NEW YORK, NOVEMBER 27, 1937

Mr. ANDREWS. Mr. Speaker, under the leave to extend my remarks in the RECORD, I include the following address which I delivered recently over the radio:

I am very glad indeed to participate at the invitation of your organization committee in this first "Buffalo's Town Meeting of the Air," and it is an added pleasure in this connection to contribute a share in this program along with my friend and colleague, Representative MEAD.

One of the real developments of the past few years in promoting the exchange of ideas, common understanding, and the consequent formation of public opinion has been the town-hall-meeting movement as assisted by the radio, and your organization committee is to be congratulated upon its initiative and industry in arranging tonight's first forum.

The general subject, "What shall Congress do to relieve unemployment," is, to be sure, a big one, and to my mind a very pertinent one at the moment—as pertinent, I may say, as it has been for the past 7 years. My time is short, so I must necessarily limit myself to the brief expression of some of the thoughts and convictions I hold on this subject.

Federal relief if it could be extended through many channels to each and every unemployed man and woman in the country for the year 1938 would not be unemployment relief—it would be temporary relief—temporary relief in most cases to those who await a regular job. I do not say that all such relief is temporary, for it is apparent to everyone who has made any study of the situation that there must of necessity be permanent relief for certain classifications and there have always been some even under prosperous conditions who wouldn't work under any circumstances. While there have been some channels established in the relief program during the past few years which to my mind would be permanently effective, on the whole the so-called pump-priming method brings us back today almost to the situation we were in 5 years ago—after billions have been spent with the resulting impairment of the Nation's credit.

Permanent unemployment relief can come for the large majority only through reemployment by industry and agriculture and the expansion of these interests. The billions which we have spent and are now spending for relief have come either directly or indirectly from taxation on industry alone.

The first necessity is then to change our policy and to start going consistently in one sound direction. The first necessity is to reestablish wholehearted American confidence that the good neighbor policy is now domestic as well as foreign. I refer to the Government in its attitude toward business.

The most encouraging aspect of the Washington picture today is that a considerable majority in both the House and Senate are disposed to do something at once to check the business recession. Everybody wants to stop the distressing spread of unemployment, revive a robust spirit of enterprise, and restore investment confidence. In a word, everyone wants to put a bottom under the present recession before it heads into a major depression. The measures enacted to meet this new situation must be sound, constructive, and clearly worked out in the orderly processes of representative government. We cannot risk a hit-or-miss program. We cannot gamble with rubber-stamp legislation. We cannot risk vast and costly experiments which will mean more taxes on industry.

Our first problem is to lift from the back of enterprise, the prevailing disastrous tax on undistributed profits. I reveal no secret when I tell you it is the firm conviction of an overwhelming majority on both sides of the aisle in Washington that business confidence will not be restored until this tax is off the statute books. It is essentially a punitive tax, which is strangling smaller

manufacturing concerns and commercial ventures in every direction. Until business is again permitted to build up normal reserves, unemployment will continue to spread, for it is these many thousands of smaller companies which are the real backbone of employment and purchasing power. Many instances have come to my attention during the past few months of business enterprises which have been abandoned entirely, simply because the capital expenditures contemplated could not be made under the prevailing tax, which penalizes the retention of profits for the retirement of debt. Adequate credit is available to these enterprises which want to get ahead. They can borrow all the money they need through regular channels at reasonable rates of interest. But these loans, if negotiated, must be paid back from earnings. And under the prevailing tax, earnings not distributed to stockholders may be taxed at an average rate of around 22%.

Therefore, the business borrower must be prepared to repay his loan not on the basis of 106 percent of the principal amount but at the rate of approximately 128 percent—that is, principal, interest, and a penalty tax upon the profits retained for his sinking fund. Obviously, very few business enterprises, particularly very few new ventures, can carry such a burden. The result is that private enterprise is being strangled to death by government. And the first impact of this unsound policy is upon employment; for you cannot give a man a job until you have a place for him to work—a roof over his head, tools, machinery, raw materials, and equipment. Neither can you keep those already employed at work unless management can profitably engage new capital for repairs and plant maintenance. Recent studies show that it requires an average investment of $12,000 to $15,000 in plant and equipment for every job provided in American industry and transportation. When a measure such as this undistributed-profits tax suddenly chokes off the market for industrial capital, we lose not only the new permanent jobs which would be given in the new plants but also a vast amount of temporary work in construction and in the machine-tool industry.

A more direct impact of this situation upon the wage earner is found in connection with the social-security program. This whole theory of social security now in operation, whatever may be its imperfections, is based upon the idea of steady employment. When employment ceases, the social-security contributions are at an end, at least temporarily. Thus, the whole idea of security for workers, without which there can be no substantial progress toward higher living standards, bogs down under the weight of the undistributed-profits tax. That is why it is contended so vigorously today that this theory of taxation runs contrary to all human experience.

Nobody is permanently benefited when Government forces corporations to reduce their reserves by making extraordinary payments in dividends. On the other hand, much harm is done. Worse, this tax operates even to defeat itself in the long run, for as business recedes there is a sudden diminishing reservoir of profits from which to derive taxes of any sort. It is possible to tax business to death. It has been done in other countries and in other times. It is not too much to say that we see the beginnings of such folly in the present system of undistributed-profits taxation. Earnings plowed back into business have been the blood stream of American industry and enterprise for more than a century. The present tax, by forcing all earnings out immediately, tends toward the slow paralysis of our entire productive system. As production is curtailed, living costs advance, until wages no longer provide the necessities of life for the wage earner and his family. This is the beginning of the disastrous spiral of depression. Congress must stop this.

Then I come to another tax, the capital gain and loss tax. At one time people considered land to be the greatest of values because land produced every need for subsistence. As the Nation grew we developed a line of business in which land provided the place to erect structures of all types from mills to cottages. Some 15 years ago dealings in land stopped suddenly. Since that time transactions in real estate have been at the lowest ebb in relation to other activities in the history of the country. What is the cause?

Real-estate buying has always attracted investors who, through ownership, could gain by effecting improvements. Towns have grown by building railroads; cities have advanced by highway connections. Improvements in living conditions have made property values rise. We have not stopped improvements here in America, but still real-estate trading has come to almost a dead stop.

The reason back of this failure to trade property values has been traced to the enactment of another law called tax on capital gain, which originated in 1913. It covers transactions in real estate, stocks, bonds, and all kinds of property. Since 1913 this tax has been revised several times. This indicates that it has been wrong from the beginning. The error was detected in 1921 when it was quickly changed and thus averted a severe financial panic. The change brought about the segregation of capital gains from normal income and placed a tax on such gains separate and apart from income. It also considered capital losses as offsets to capital gains. This change resulted in renewed trading in all types of property. The Government collections from the trades were meager in spite of the accelerated trading, which lasted until the beginning of the depression in 1930. The causes of this depression, which we are still in, have been debated from various angles, but one of the contributing factors was this tax on capital gain.

People who did not want to take losses or register gains (and thereby pay more tax) held on to their property. Holding on made less supply available and consequently higher prices prevailed. But 1930 through 1933 were sad years. The skyrocket prices soon petered out. The supply was greater than the demand and prices fell to unbelievable figures. Government made nothing out of this situation because capital losses offset capital gains and people actually look losses to reduce taxes.

In 1934 the tax doctors did another job on the capital-gain tax. They extended the period of holding property (to classify capital transactions) from the original 2 years, as in the 1921 law, to a scale up to 10 years. This was intended to preserve trading but instead it stifled it. The longer you hold your property now the less tax you pay, and so you hold on. You stop trading.

Why do we have such a law? We are supposed to have income-tax laws for revenue purposes, but this has not always been followed. There have been general complaints against people who invest, take risks and gain, but no one can ever do this without advancing the standards of the whole country. Trading is the life of a nation's advancement. We must trade to distribute and we must distribute to advance. Since this capital-gain tax produces no revenue but only prevents trading from taking place, as for instance acquiring property and improving it, we, as a nation, should not tolerate the continuance of any tax which is a detriment to better living conditions.

Trade which is permitted to flow will always create employment; trade that is plugged will retard and even stop employment, and when this happens people are forced to seek relief. Government pays the relief and at the same time penalizes itself. It finds itself hunting around for means to take care of the relief.

Therefore to relieve unemployment I would first favor relieving industry by wiping out or at least readjusting both the undistributed-profits tax and the capital-gains tax. If Congress did nothing else, this would accomplish a world of good.

We are then confronted by the secondary problem of where substitute revenues shall be raised and with an additional amount to provide eventual balancing of the Budget. For the recent sharp increase in the national debt makes it impossible for the National Government to risk any further instability in Budget management. In the face of declining business, the Treasury already has been forced to reduce its revenue estimates for the current fiscal year, and as yet there has been no corresponding reduction on the spending side. We face, therefore, a greater deficit than the $700,000,000 mentioned by the President on October 19. To fill this need Congress can change the general basis of taxes. A plan known as a gross-profits tax is now under study by high authorities under which more businesses in the country would pay taxes. That action should naturally follow, for when we move to correct the destructive means of taxation, business will actually get better.

The only difference between doing nothing else and doing something else about it will be evidenced in the speed with which people go back to work. By a better spread of taxation so that all business shares its proper proportion of the cost of government in a normal, natural way, employment will increase, Government cost will decrease, and Government receipts will grow larger. This seems to be what we are seeking.

Business by now should have learned its lesson, as well as the Government. Make 1938 a trial year for industry to see what it can accomplish. Put industry on trial for 1 full year under this program and you will see results.

I am hopeful that the results of the present unemployment census soon to be completed will be accurate and the present indications are that this census is going to be well done. With this we will have some real information on which to base appropriations for relief. All of this can be taken care of under a plan such as I have outlined. Put these changes in our tax structure into effect for 1938. Put it up to industry. Next to the employee out of work, no one has borne the brunt of the last 7 years more than the average head of the average small business. There are few persons on any sort of relief who would not rather have a real job of their own. I do not mean to say that this program will solve all our difficulties, but it will go a long way and, if adopted, I am sure, another census taken at the end of next year will justify this course.

Political Economics

EXTENSION OF REMARKS

OF

HON. ELBERT D. THOMAS

OF UTAH

IN THE SENATE OF THE UNITED STATES

Friday, December 3 (legislative day of Tuesday, November 16), 1937

ADDRESS OF HON. JAMES A. FARLEY, CHAIRMAN OF THE DEMOCRATIC NATIONAL COMMITTEE, DELIVERED AT A DINNER GIVEN IN HIS HONOR BY CIVIC ORGANIZATIONS AT LINCOLN, NEBR., OCTOBER 23, 1937

Mr. THOMAS of Utah. Mr. President, I ask unanimous consent to have inserted in the Appendix of the RECORD an

address on the subject of Political Economics, delivered by Hon. James A. Farley, chairman of the Democratic National Committee, at a dinner given in his honor by civic organizations at Lincoln, Nebr., October 23, 1937.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

My friends and fellow Democrats, it has often been said that if a man knew in advance how the political tides were running in the State of Nebraska he would have a pretty good idea of how they were running in the rest of the United States. There is a great deal of truth in that saying, because Nebraska is not alone close to the heart of the Nation from a geographical standpoint; it also comes close to being at the heart of what the American people are thinking and feeling.

From the time of its inception the New Deal inaugurated by the administration now in power at Washington has received sympathetic consideration from the citizens of this State. There is a reason for that. Nebraskans have long since gotten over the mistaken notion that because a thing is new, therefore, it must be dangerous. You have seen too many innovations in your own State and local governments to believe the silly charge that any effort to improve the Federal Government is bound to fail. On the contrary, I think the general viewpoint here is that the Government, like an individual, must adapt itself to changing conditions and environment or else pay the penalty.

There is always a worth-while incentive in speaking to a Nebraska audience because the voters seem to have the habit of concealing their intentions until they walk alone into the polling booth. In other words, it would be a rash political manager, indeed, who would start off a campaign with the assumption that Nebraska was certain to fall into his column. I'm sure that you retain a few vivid impressions of last fall's election; you recall that the final outcome was highly satisfactory, but during the early months of that sizzling campaign we were compelled to devote considerable time to the job of determining just what the good citizens of Nebraska intended to do. I would hardly go to the extent of saying it was a doubtful State, but it surely was deliberate in making up its mind. However, the thumping majority rolled up for the Roosevelt-Garner ticket was a fine tribute to the intelligence and discrimination of the Nebraska electorate, and I wish now to thank each one of you from the bottom of my heart for the splendid part you played in bringing about that victory.

This is what is known as an off year politically, because there is no national election and only a few State contests, but it would be a mistake to assume that there is little interest in public questions. In fact, the opposite seems to be true. I can hardly recall a time in my lifetime when there has been such a sincere desire on the part of the electorate to know what is going on and to understand the true import of public events. The average citizen seems to be observing what is taking place nationally and to have a keen concern over international affairs as well. That is a decidedly healthy condition in a democracy, and as long as we have a citizenship as alert and alive as the American public, the Government is bound to be responsive to national needs.

Perhaps one reason why men and women are showing such enthusiastic interest in world happenings is because they have more time to do so. The tension and the worry of a few years ago have been dissipated. When a home owner was facing the daily fear of losing the roof over his head, or a farmer was toiling 12 or 14 hours a day with the certain knowledge that he would fail to get back even the cost of production, the immediate problem at hand was the only one that received consideration. It could not be otherwise. But it is pleasant to know that those anxious days are over. The tremendous energies of America are at work once again, and the results can be seen from the Atlantic to the Pacific. People don't have to be told that better times are here again; they know it from their own experience.

The picture is very much the same everywhere. Farm prices are back at reasonable levels, stores and theaters are crowded, freight cars are bulging with products, manufacturers are finding new markets for their products, and above and beyond all those factors, the mighty forces of confidence and enthusiasm have been restored to the hearts of more than 100,000,000 Americans.

A few facts tell the story better than a book of argument. Let's take Nebraska as an example and consider briefly what are the basic economic factors. I saw a news story recently in which a Nebraska editor predicted with a touch of pride that the total farm income for this State may be well over $300,000,000 for the current calendar year. That's a fair showing in view of the fact that just 5 years ago it was less than half that figure, or under $150,000,000. These additional dollars finding their way into the pockets of Nebraska farmers are bringing prosperity to every merchant, every businessman, and every professional man in the State. The improvement is not limited simply to those who raise wheat, corn, or oats, or those who raise cattle. It is what the economists call balanced prosperity, and it is the only kind we want in this country.

The motorcar has come to be a fairly accurate symbol of how things are going from a business standpoint. In 1932, this State had 13,368 new automobile registrations. In 1936, there were 44,691 new ones, a gain of over 200 percent. You know without my saying what that has meant in increased gasoline consumption, oil consumption, and in necessary highway improvements. It would be easy to go on reciting comparative figures of growth for other Nebraska industries, but there is no occasion for doing so. Any man who traveled through this region in 1931, as I did, when wheat was selling at 35 cents or less and corn was selling at 6 or 7 cents, can realize what these improved price levels mean to the people who live here. It can be said without fear of challenge that the greatest feat of Government in our generation has been the rehabilitation of agriculture by the Roosevelt New Deal.

In citing the advancement made by the farming industry during the course of the past 5 years, it is necessary to bear in mind the vital part played by the stabilization of the banking business. A great many people are under the misapprehension that the continued failures of banking institutions which finally resulted in collapse was a direct result of the Nation-wide economic depression. Nothing could be further from the truth. The figures show conclusively that for years before the depression, during the so-called boom period of the late twenties, there was an alarming rate of bank failures which cried out for corrective measures.

In fact, there were more than 8,000 such failures during the 10-year period from 1921 to 1931, not including, of course, those that went down in the final crash. But unfortunately, the Government at Washington was in the hands of an administration that ran away from problems instead of facing them, an administration that was under the curious delusion that the way to take the pulse of agriculture was to watch the gyrations of the Wall Street stock ticker. It was a fatal policy and the whole Nation paid the penalty.

Things are different now. The country is under the administration of a Chief Executive who, when he sees a problem, looks it squarely in the face, states the facts, and then bravely and courageously proposes his solution to the American people. He never shirks a task simply because it is unpleasant. That is the way public questions should be handled in a democracy. The policy has been followed consistently by President Roosevelt during the past 5 years and as a result, there have been more complex problems properly disposed of, in that time, than during any period of similar length in the country's history.

A fair test of any administration is its success or nonsuccess in promoting the economic well-being of the people. We have reviewed what is happening in Nebraska. The entire country is in the same state of excellent economic health. It has been estimated by reliable authorities that the aggregate income of the American people for the present year will be in the neighborhood of $70,000,000,000, a figure which is only eleven billions less than the maximum reached in the peak year of the predepression era. In view of the unsettled state of world affairs, and considering the factors of debts, mortgages, and other handicaps which tended to retard the upward swing, the record achieved by the Roosevelt administration is truly remarkable. And the most comforting fact in the entire situation is the reassuring prospect that things will continue to improve in the years that lie immediately ahead.

Perhaps we have devoted enough time to economic matters. After all, it is possible to state with a degree of accuracy what is happening in business by the mere recital of figures and statistics that cannot be disputed. But in politics, the method of approach is somewhat different. Even the simplest statement of fact is often disputed by spokesmen for the opposition and quite often they convince themselves even if they fail to convince anyone else. That may be a good thing. I sometimes wonder if the opposition would have worked so furiously and talked so belligerently in last fall's campaign, had they been able to foresee the actual result a few months in advance.

Just at present the Democratic Party is receiving a flattering amount of attention from the gentlemen who are endeavoring to revive the somewhat battered hulk of the Republican elephant. While they work feverishly to revitalize the unfortunate critter, they steal frequent sidelong glances over the fence to see what is happening in our backyard. They profess to be pleased at what they see. In fact, during the past few months, some kind of a record has been established by the number of screaming news stories predicting a serious split in the Democratic Party, every one of them coming from Republican sources or other sources hostile to the New Deal. To borrow a hackneyed phrase, the gentlemen are seeing things. Despite their fond expectations, let it be said here and now that the Democratic Party has no intention of emulating the example of the Republican Party by committing political suicide. The only party in the United States today that has developed the necessary capacity and leadership to deal with the social, industrial, economic, and foreign problems which beset the American people is the Democratic Party, and it is going to be in power for a long time to come. Individuals may change but the party is going forward. Instead of drawing to a close, the present period of Democratic dominance is just about getting under way.

There are bound to be differences of opinion when a party moves forward resolutely and honestly to do those things which must be done to protect the economic interests of the farmer, the workingman, and the small businessman. Differing views on method always exist in politics and elsewhere. But let me emphasize this. There is room in the Democratic Party for every man who sincerely believes in the ideals and objectives of the Roosevelt administration and who is willing to cooperate faithfully in translating those ideals into definite action. By that I do not mean mere lip service—the ancient practice of promising one thing before election and adopting another course afterward. The senior Senator from your State, the Honorable GEORGE NORRIS, who is not a member of our party, has given a remarkable demonstration of faithful adherence to principle during his half a century of public life. During all that time he has stood like a rock for

what he believed in, and perhaps that fact explains in large measure why he has always had such a hold on the affections of the Nebraska people.

So I say again that when people talk about a split in the Democratic Party they are merely indulging in wishful thinking. If public men start out to defeat the objectives of the Roosevelt administration, of course, they must answer for their actions to the people. Every officeholder has to do that, whether he is for or against the New Deal. But I may add that it is extremely comforting to be for the Roosevelt administration when election time rolls around. The results show that conclusively on every test. A few weeks ago there was a special election in a Massachusetts congressional district. Apparently believing their own talk about a drift away from the Democratic Party, the Republicans made a strong bid to capture the seat, sending many of their outstanding spellbinders into the district, including two Members of the United States Senate. When the ballots were counted the Democratic candidate was found to have a substantial plurality, although up until a few years ago the district had been Republican. The people at any rate are still staunchly behind the President.

I can hardly pass over my own State of New York where a recent primary contest was employed by those who oppose the Chief Executive to test the popularity or lack of popularity of the national administration. The issue was clear-cut and accepted by both sides. The outcome left no doubt as to the popular feeling. It was another inspiring triumph for those who advocate the policies and program of the Roosevelt administration. The story has been the same in every State where the issue has been raised.

Although the next congressional elections are still more than a year off there are signs of unusual and extraordinary activity on the part of our political adversaries. Apparently the thought has struck home to the captains of the G. O. P., after three successive disasters in national elections, that the American people will have nothing to do with a party that has neither a program nor competent leaders. The press is carrying reports to the effect that the Republicans may shatter precedent by holding a national convention, or something akin to it, in advance of the congressional campaign. In every one of these reports we read about a ground swell of demand coming up from the grass roots for new Republican leadership, new blood, new ideas, and a fresh outlook on national problems. Not only that but we are solemnly assured by some news writers who are partisan to the G. O. P. that we are about to witness this magical transformation of the Republican Party. A well-known advertising man, who is going to run for Congress on the Republican ticket, explained that the idea is to "repackage" the good old G. O. P. He said that very often when sales drop off it is a practice of advertising specialists to discard the old-fashioned package and to give the product a modern, up-to-date container.

On the strength of those glowing promises of what was about to occur in Republican ranks I had been looking forward, like millions of others, for the first definite signs of the new party alinement. And then came a headline story about a secret meeting of the men who are apparently going to direct the campaign of rejuvenation. Who were they? Among those attending the secret meeting were former Gov. Alfred M. Landon, of Kansas, and former Republican President Herbert Hoover. Now, that may be a new deal to some people, but somehow those names sound strangely familiar. I have a vague notion that if the G. O. P. attempts once again to sell that kind of leadership to the American people the result will be the same, no matter what kind of pretty package is used to do the wrapping.

While on this fascinating subject of party splits it might be well to consider the subject from another angle. Even the Republican leaders themselves are stating frankly in the press that the party will get no place unless it develops new leaders and a forward-looking constructive program. That is correct. And it is also correct that just as soon as a genuine attempt is made to work out such a program a split will develop between the progressives and conservatives in the Republican ranks that will seem like the Grand Canyon to those who are given the job of bringing both sides together. Can you imagine Mr. Hoover and the millions of conservative Republicans who think as he does, sitting down to work out a progressive program that would embrace the exact opposite of everything he sponsored as President? Can you imagine the independent voters of this country endorsing a program worked out by the stalwarts of the Old Guard? No; the danger of a party split is not menacing the Democratic Party; the elections show that we have the great majority of the people with us, and that is what counts; the Republicans must do the worrying on that score.

The story of why the Democratic Party is going to remain dominant in this country is written in the record of accomplishments of the past 5 years. A sincere and honest effort has been made to work out a solution for every one of the complex problems which must be solved by Government action. The Republican Party has lagged behind on every occasion, content simply with a meaningless policy of opposition. The situation is the same today. A few nights ago Governor Landon delivered a radio address which failed to contain a single constructive suggestion, while on the other hand our party leaders in Congress are still driving forward to improve legislation on farming and other vital problems while the minority party has nothing at all to offer.

The banking policy of the administration has been highly successful. The farm policies have likewise been successful. A fine start has been made on the task of stopping soil erosion and land waste. The Nation's natural resources have been developed as they never were before. The social security law is in operation. The C. C. C. camps have made a splendid record of preserving both natural wealth and human wealth. The stock markets have been brought under reasonable regulation by the Securities and Exchange Commission. A Public Works program has been carried on by means of which during a period of depression the Nation's physical plant has been expanded and to a considerable extent rebuilt. The Navy has been rescued from a state of neglect so that today, amidst the booming of guns and the rattling of swords, we hold our position in the world secure and confident in the knowledge of our own strength.

Those accomplishments tell the story of why the Democratic Party is still receiving a fresh endorsement every time the issue is put to a test at the polls. The essence of democracy is majority rule and the program being carried to completion by the administration now in power is based upon the needs and the aspirations of the overwhelming majority of American citizens.

To those people who were inclined only a few short years ago to be skeptical over the future of democratic institutions both here and elsewhere, the present stable and prosperous condition of the United States provides an effective answer.

President Roosevelt has never found it necessary to pursue policies of expediency that bring temporary success at the cost of destroying the peace and happiness of others. To distract attention from domestic conditions, he has never resorted to the frightful practice of violating the liberty and security of neighbor nations. Neither has he sought to advance his own political fortunes by flouting the most sacred human rights of unfortunate minority groups within the population. On the contrary, the Chief Executive has adhered with steadfast resolution to those principles of popular government and fair dealing which constitute the backbone of genuine Americanism.

While other nations have adopted the practice of applying their substance to the wholesale manufacture of armaments and their talents to devising new instruments of destruction, the President has pursued a long-view policy of building roads and highways, dams and power plants, and other constructive works that will tend to promote the well-being of the entire population. We are beginning to reap the benefit of these projects already; we will continue to reap them for generations to come.

In the midst of a world menaced and harassed by wars and rumors of wars he has pursued the pathway of peace and he has demonstrated to men of good will everywhere that democracy still lives. And despite the outward hostility of despots who profess to scorn democracy, President Roosevelt has won their secret respect and envy because he has succeeded where they fail.

The development of a program of government, like the construction of a great building, requires time and patience. An observer standing by may be puzzled at times as to why certain steps are necessary for the completion of the edifice. President Roosevelt has been forced by circumstances to adopt heroic measures at times because of the critical conditions which he has had to face. But, as time goes on, the wisdom of his course becomes more apparent. The United States is moving forward steadily and firmly toward the goal of prosperity and security which you and all other citizens have a right to expect from your Government. The program is succeeding in unprecedented fashion because its appeal was directed to the common sense of the American people.

Dedication of the Naval Monument at Brest, France

EXTENSION OF REMARKS

OF

HON. DAVID I. WALSH

OF MASSACHUSETTS

IN THE SENATE OF THE UNITED STATES

Friday, December 3 (legislative day of Tuesday, November 16), 1937

ADDRESS BY HON. JOSEPHUS DANIELS, SECRETARY OF THE NAVY DURING THE WORLD WAR, DELIVERED AT BREST, FRANCE, AUGUST 12, 1937

Mr. WALSH. Mr. President, I ask unanimous consent to have printed in the RECORD an address delivered by the Honorable Josephus Daniels, who was Secretary of the Navy during the World War and is our present Ambassador to Mexico. The address was delivered upon the occasion of the dedication of the naval monument at Brest, France, August 12, 1937, as a memorial to the distinguished services of our World War Navy.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

"Hail, Count de Grasse; we who are ready to die salute you," was the expression in spirit, if not in words, that animated the sailors who piloted to Saint Nazaire the transport carrying the first Americans to fight in France as they landed in June 1917. It was likewise the salute of American soldiers awaiting the day when they and their comrades to the number of 2,000,000 should

fight under the illustrious soldier-statesman, General Pershing, commander of the American Expeditionary Forces, and win victory side by side with the Allies.

Proud and fond memories, stretching from the year 1781, when the French fleet under de Grasse in American waters contributed the decisive sea power to insure American independence, to the proud day in 1917 when American naval ships 136 years after Yorktown paid the return visit to the French coast in the day of France's peril—these memories crowd upon us today in this ancient naval base beloved by America and France. As we dedicate here the memorial in honor of Americans who, going down to the sea in ships, gave supreme proof of a patriotism which animated all free nations, there is thanksgiving that their bodies lie in the free and sacred soil of their beloved France as their souls are with the stars.

The years 1781 and 1917–18 forever link in imperishable friendship the people of France and the United States, cemented as they are by the blood of men who loved liberty more than life. As we reflect upon American naval participation in the World War, with Brest as the chief French port to welcome the incoming fresh troops, our minds go back to the crucial days when American independence hung in the balance and help and deliverance to the colonists came from the soldiers and sailors of the French Republic. The world has given the accolade to Lafayette and Rochambeau and others of their countrymen who joined their fortunes with the troops of Washington. Too much honor and gratitude cannot be given them. Today, however, as we dedicate a memorial to heroes of the American Navy, it is fitting to appraise the obligation America of 1917 owed to the Navy of France in the days of the American Revolution. In his extremity, Washington felt the necessity of strong naval support and agreed with his French comrade, Rochambeau, who wrote "Nothing without naval supremacy." Washington displayed genius in declining to send the American and French troops into the major attack until he could depend upon naval superiority. That supremacy could be supplied only by the French fleet. He, therefore, directed Capt. John Barry, pioneer of naval heroes, to take Henry Lawrence and Thomas Paine on his frigate *Alliance* to France with this urgent message: "This is our last chance; our country is exhausted, our forces are nearly spent, our cause is nearly lost. If France delays a timely and powerful aid in this critical posture in our affairs, it will avail us nothing should she attempt it hereafter." That appealing S O S found the French authorities sympathetic. No mission was ever more fruitful of potential results. "It is impossible to send you troops," came the reply addressed to Rochambeau, "but a new fleet is being sent." It is not without significance that the name of de Grasse's ship which carried the reassuring message to Washington bore the name of *Concorde*, typical of the relations that have ever existed between the two peoples.

The timely arrival of that fleet and its signal victory and essential protection insured the decisive event which ended the War of the Revolution in the guarantee of independence. "The French naval fleet of Admiral de Grasse left no choice but surrender and decided the war," declares the historian Knox, who adds that "General Washington's 3-year dream of a French naval unit to cooperate with his army was thus sealing the doom of Cornwallis, deciding the war and delivering from the throes of revolution the greatest Nation yet born."

Washington, always given to moderation in expression, wrote de Grasse, "The honor of the surrender of Yorktown belongs to Your Excellency." To Congress he wrote, "I wish it was in my power to express to Congress how much I feel myself indebted to Count de Grasse and the officers of the fleet under his command," and upon Washington's recommendation, Congress passed an act expressing the thanks of the United States to Count de Grasse "for his display of skill and bravery."

A century later with the perspective of time, after long study of naval history, America's foremost naval statesman, George Dewey, weighed the scales as to the effect of the coming of de Grasse's fleet to the Chesapeake. He said:

"Let us never forget that upon the list of deathless fame stands forth the name of Count de Grasse, the French commander who did so much with the splendid fleet sent over by our sister nation, France, to help this country in achieving its independence. The careful reader of history knows that the operations of de Grasse's fleet were of powerful effect in bringing about the surrender of Lord Cornwallis and ending the war. All latter-day writers agree that the successful ending of hostilities was due in great measure to the sea power of France."

The passage of the years may have dimmed for a time the recollection of the events in that crisis of the Colonies. The sense of grateful appreciation surged in the breasts of all Americans in 1917–18 as their sons embarked to render to liberty on the soil of France the same last ounce of sacrifice which the French poured out for the same ideal on American soil a century and a third before.

As the ships bearing the troops neared the shores of France in 1917–18 the men in khaki and in naval uniform were stirred to the depths as sailing through Quiberon Bay and the waters adjacent to Brest they recalled with a glow thrilling their pulses (a glow which courses through the veins of patriots of all times as they follow the course of the French fleet and appraise the value of its epoch-making mission), that on February 15, 1778, even before the surrender at Yorktown, the first salute by a foreign power was made by Admiral La Motte Picquet as a return to the salute of the French flag by John Paul Jones, commander of the *Ranger*. Jones wrote that this salute was "in fact an acknowledgment of American independence." He also records: "I obtained a salute from the flag of France both at Quiberon and Brest before the treaty of alliance was announced." Near the Fourth of July 1917 the great guns of the French Navy pealed forth a greeting as the American ships under Admiral Gleaves returned the visit of Admiral de Grasse. It was the return of the *Concorde* with all that precious name typifies. It fulfills in our day the toast of Lafayette that the unity of the American Republic "has saved us in our time of danger" and his prophecy, "It will save the world."

The Fourth of July 1917 will ever be memorable in American annals because on that day the people were electrified by the official announcement that the first transports carrying troops to take part in the Great War, sailing on June 14, had arrived safely and been given enthusiastic welcome by the French people. The information was all the more heartening when it was reported that they had escaped the torpedoes hurtling through the seas and threatening their destruction. It is not possible in the perspective of 20 years after to appreciate the ecstatic rejoicing which welcomed the glad news. If, however, we could carry our minds back to 1917, when anxiety sat upon every father and mother and fear cast its shadow on every hearthstone, the significance of the arrival of the ships carrying 14,500 men, the earnest of 2,000,000 more, could be adequately apprehended.

The leaders of the nations with which we were at war had not believed the contribution of the United States in the World War could be immediately effective. It was freely asserted by some of our proponents in those trying days, with confidence as to its truth, that the United States had no body of trained soldiers and that raw recruits could not be whipped into shape in time to stay the march of the army of the Central Empire; and even if the United States had an army it was asserted it lacked the ships to transport the soldiers overseas; and if by some magic the ships could be commanded, the submarines would sink them and their cargoes of fighting men before the French coast was reached.

It was such widely held misconception of allied initiative and ability to overcome obstacles that misled some people in Germany and carried fear to the hearts of the Allies and indeed caused apprehension to the fathers and mothers in the United States. If the public had known the full extent of submarine sinkings, kept as a closely guarded secret, the anxiety would have been a thousandfold more disquieting. The U-boat menace was at its peak of success and allied morale was threatened by the destruction of ships on the high sea. The supreme thought on both sides of the ocean was whether transports could avoid the death-dealing torpedoes. The officials of the United States, charged with the grave duty of transportation, fully realized the gravity of the situation and the dire perils to be encountered. They had been officially informed that the amount of British and Allied shipping lost in February 1917 was 536,000 tons, 571,000 tons in March, and 205,000 tons in the first 10 days in April, and had been advised that "with short nights and better weather these losses are increasing." Ships were being sunk twice as fast as all the shipyards in the world were building ships, and England feared if the destruction continued at the prevailing rate the people would be without food at the end of 6 months.

Such was the critical situation that existed when the first ships bearing American soldiers left the shores of the United States. The date of their sailing was known only to the few entrusted with the great adventure; not even the captains of the ships knew the destination, their sealed orders reading "Fit out for distant service." Such secrecy surrounded the operation that no hint reached the anxious parents or the general public of the time of sailing or when detachments of soldiers would sail or what ships would carry the precious freight. As the ships neared the coast of France they were met by destroyers to afford protection through the danger zone. That thoroughly effective protection existed from the sailing of the first transport ship. At the signing of the armistice over 300,000 soldiers were being transported every month.

The order from the Secretary of the Navy, which held throughout the whole war, was in these words: "The paramount duty of the destroyers in European waters is the protection of transports with American troops. Be certain to detail an adequate convoy of destroyers, and in making the detail bear in mind that everything is secondary to having a sufficient number to insure protection to American troops." It is to the everlasting honor of the Navy that the carrying out in letter and spirit of that order made the bridge to France so safe that not a single life was lost on an American transport when under naval protection, while over 2,000,000 soldiers passed through the waters infested with submarines.

In the early days of the war the chief apprehension in the United States was lest the soldiers would meet a watery grave before reaching the battlefield. There was confidence that the fighting men would give a good account of themselves once they were in the trenches. But could they escape this menace of the seas? That was the uppermost terror that denied sleep to parents. When the news was flashed that the first convoy had arrived without loss, apprehension gave way to confidence. That information was furnished the public in official correspondence between the Secretary of War and the Secretary of the Navy and made public on the Fourth of July. "As you know," wrote Secretary Baker in releasing General Pershing's message that the ships had arrived safely, "the Navy assumed the responsibility for the safety of these ships on the sea through the danger zone. The ships themselves and their convoys were in the hands of the Navy, and now that they have arrived, and carried, without the loss of a man, our soldiers who are the first to represent America in the battle for democracy, I beg leave to tender to you, to the admiral, and to the Navy, the hearty thanks of the War Department and the Army." He added that "this splendid achievement

is an auspicious beginning, and it has been characterized throughout by the most cordial and effective cooperation between the two military services." The Secretary of the Navy, in reply, said that "The Navy accepts the thanks and gratitude of the Army as an expression of fraternal esteem rather than an acknowledgment of sole achievement," and he added: "In behalf of the men whose courage gave safe conduct to courage, I send you the greetings of the Navy, awaiting in full confidence for the day when the valor of your soldiers will write new and splendid chapters in the heroic history of our liberty-loving land."

Into the maw of Brest and other ports on the French coast poured into France the 2,000,000 Americans who constituted an effective part of the invincible force which compelled the signing of the armistice.

Brest soon became the chief port of landing because it was available for ships of any craft or size, because it could be mined against the enemy, and because its inside harbor could accommodate any number of ships. For rapid loading and unloading of troops and supplies, the repair and refueling of ships, it was found to be ideal in a day when quick turn around was vital. Quite important was the fact also that Vice Admiral Moreau, in command of the naval district, displayed a noble spirit of cordial cooperation that won the admiration and affection of Admiral Wilson, the distinguished American naval commander in western France. That relationship was expressed in these cordial terms by Vice Admiral Schwerer: "On July 4, 1917, there arrived in our waters the first eight ships of war sent to France by the United States to fight with us. This squadron was the vanguard of a flotilla of ships, each day more numerous and more powerful, which arrived from the other shore of the ocean to take part in the fight." He voiced esteem and warm admiration for the promptitude of America in "throwing itself into the most terrible of wars" and rejoiced that the two navies had "collaborated in the protection of convoys." Like letters of felicitation were exchanged on the never-to-be-forgotten anniversary by Admiral Moreau and Admiral Wilson, the latter expressing the proud privilege of the American Navy in working with the French Navy, "for which we have the highest admiration." On that day the French Minister of Marine telegraphed Admiral Wilson:

"I am particularly happy to address to you my most cordial regards in recognition of the perfect and devoted cooperation which our Navy in Brittany have not ceased to find with the American naval forces placed under your high direction and the sympathetic harmony of views and sentiments which has not ceased to reign between us."

The mission of the United States naval forces in France was thus officially crystallized in a sentence: "To safeguard United States troops and store ships and to cooperate with French naval authorities." History does not record a more perfect execution of an official order. It is a matter of distinguished naval history that so efficient was the protection of transport ships that no American troop ship en route from the United States to France when escorted by American vessels was torpedoed or successfully attacked on the high seas, and only five troop ships west-bound, without troops, were successfully attacked. That is a record without parallel in a war marked by the destructiveness of the submarine. This was made possible by the lookouts and signal stations of the French and American cooperation, as well as by the marvelous courage and seamanship of the officers and men on the destroyers and other naval craft. The expert communication service enabled the officers to learn of the possible presence of enemy submarines so steps could be taken to send the nearest armed vessel for search and attack, and to divert the convoy to another route or turn back, if necessary.

To the American Navy, the first line of defense, was given the honor of also being the pioneer in the offensive when the United States entered the war. The first war order was given a few days after the declaration of war by the Secretary of the Navy. It was the dispatch of a division of destroyers to initiate the joint operations in British waters to stem the tide of submarine sinkings and to act in perfect accord with the British Navy. Under the direction of Admiral Sims, the brilliant commander of American naval forces in European waters in the many operations which brought glory to the navies of both English-speaking nations, there was a concert of action which was not only most effective but which strengthened the chords of brotherhood and unity. On the anniversary of the arrival of the first American destroyers in British waters, Admiral Bayly, in command of naval operations at Queenstown, expressed "deep gratitude to the United States officers and ratings for the skill, energy, and unfailing good nature which they have consistently shown and which qualities have so materially assisted in the war by enabling ships of the Allied Powers to cross the ocean in comparative freedom," adding, "to command you is an honor, to work with you is a pleasure; to know you is to know the best traits of the Anglo-Saxon race."

The first American force to reach France was an aviation detachment which arrived on the French coast early in June 1917, preceding the coming of the soldiers, the forerunner of the naval aviation force that reached many thousands before the armistice. With the establishment by the joint action of French and Americans on the French coast the sinking of ships near the shores of France almost came to an end. After that establishment only sporadic and generally ineffective hostile acts on the part of opposing vessels occurred in these coastal waters. The joint defensive kept open the western shore of France. This cooperation of French and American fighting men not only insured the safe passage of our troops and supply ships but brought about and cemented an esteem and affection which proved to be as beautiful as it was an effective contribution in winning the war.

It was truly said that the French coast was "the neck of the bottle" because through its ports, chiefly Brest, the Americans came in ever-increasing numbers. I was here in the ancient military post of Pontenazen that American soldiers were quartered as they left their ships and were given first training until they moved into the war zone. I will never forget my visit to that army post when the commanding officer, Gen. Smedley Butler, evidenced as much ability in that important assignment as he had rendered as a soldier in half a dozen parts of the world where the marines performed dangerous duties. Increased to accommodate many more thousands of soldiers than its construction contemplated, it became the clearing house for a million soldiers just landed and ready to go into trenches and later of hundreds of thousands who said good-bye to comrades as after the Armistice they sailed for home from Brest with all the honors of splendid courage and victorious achievement.

The World War was won on the western front by the combined valor of the soldiers of the allied and associated armies. To that invincible force the Navy contributed valiant aviators and militant marines. Its chief contributions of the offensive were the successful war on the submarines, the laying of the mine barrage in the North Sea, which began to take toll of U-boats even before its completion, and other mine barrages; the safe convoy of merchant ships; the utilization in our naval railway batteries of the 15-inch guns in answer to the long-range gun shelling of Paris; the brilliant feats of naval aviators "battling in the central blue" of European skies; its radio which girdled the globe; and every other activity which a navy could render on both sea and land. But the paramount service of the Navy was the safeguarding of transports which bore to France the vast force which gave decisive strength toward the victory of the Allies. The ferry to France was the greatest sea-borne transportation feat in history, in that it was carrying 2,000,000 men over 3,000 miles infested with submarines. They were precious cargoes of human freight. That it was so regarded when its commanding usefulness was fresh in the minds of the world is attested by commendation by those most competent to testify.

No better description has been given, among those by many experts, than that of Captain Frothingham, who said: "As a result of the overthrow on the western front and in response to the earnest call of the Entente Allies, there began the most gigantic movement of troops over the sea the world has ever seen. This was the naval operation which hurled a decisive military force upon a victorious advancing enemy. The Navy was responsible for delivering the margin of troops necessary for success in the great crisis of the war." Like tributes to the Navy's successful carrying out of the biggest troop transportation could be quoted from many noted statesmen and military leaders. Lloyd George said in the House of Commons: "It is an amazing piece of organization which has enabled the bringing of such a vast number of first-rate American troops to France"; and the First Lord of the British Admiralty said: "Viewed from the standpoint of a seaman it is unparalleled in history." The declaration of Gen. John J. Pershing, who was in the best possible position to speak with authority, gave this brief evaluation: "We fully realize that had it not been for the Navy, which kept watch and guard night and day over our transport fleet, the American effort in France would never have been successful."

On this day of dedication I deem it a duty to the heroic dead to touch upon some high lights of the imperishable record made by our naval personnel in the World War, by those we honor here who gave all they were and all they hoped to be.

Upon his arrival in Brest during the conflict our honored President, Franklin D. Roosevelt, then Assistant Secretary of the Navy, said: "Ours is a silent service." Ships sailed in secrecy. Naval operations could not be revealed. Officers and men worked unseen and unsung. Victories could not be celebrated or heroes properly honored at the time of their achievements. Men buried here and elsewhere went unheralded to their graves, denied by war's necessities the praise their courage commands. Now the time has come when the world should be told how those who died passed worthily into immortality.

Privileged to be their commander in the great enterprise in which they gave their lives, I would be remiss to them and to their associates who survive if I failed to sum up what their Navy accomplished in that mighty conflict. Most of the men buried here were in the bloom of youth. Life was dear to them. They looked forward to the day when they would be blessed by wives and children and could found homes with sweet satisfaction. At the call of their country, they surrendered their hopes and ambitions and laid them on the altar of their country. Embalmed forever in the affection of their countrymen, to us they will remain forever young. Always in our memories they will be the intrepid boys they were when they sailed away amid our hopes and prayers. Life, with all its powers, they held in trust to save a holy cause. Their country's flag was then a cloud by day and a pillar of fire by night. Its crimson stripes mingled with their hearts' blood; its starry folds covered them in death. They lived and died in the hope that their sacrifice would insure a warless world.

Grateful as they were for France's help in our Revolution, Americans in arms did not come to France to discharge that obligation. They crossed the sea for one and only one reason. It was that they might remove the curse of war. Other auxiliary causes may have operated, but the goal they held before their eyes was a world which would some day settle differences without the arbitrament of the sword. They were upheld by the lofty aim expressed by their immortal Commander in Chief, Woodrow Wilson, who as they sailed gave them these words of admonition: "Let us set for ourselves a standard so high that it will be a glory to live up to it and add a new laurel to the crown of America. My affectionate confidence goes with you in every battle and every test. God keep and guide you."

It is an insult to the memory of those who fell and those who survived to say that they were mobilized in hate of any people, in fear of conquest of their own country, to save themselves, or because their rights upon the seas were jeopardized, or from chivalric knight errantry to help other nations. These and other contributing causes helped to turn the scales. Never, however, until persuaded that by throwing their weight into the world struggle they could enlist in a war against war were the American people united in the noble ambition to win peace by fighting. If statesmanship failed to reap where the blood of the men of the Army and Navy was sown, that does not dim the lofty inspiration that caused our youth to cross the sea. Those who fell and those who survive were actuated alike by a lofty faith that their contribution would aid mankind in finding eventually a sure and permanent way to end all wars. It was a dream, a glorious dream, that inspired their consecration. That banner in the sky upheld them in the trenches and the perils of the deep. That same faith undergirded them in suffering and sickness and comforted them to the gates of death itself. They did not live to share the bitter disappointment of those of us who survive; to realize that the goal of universal peace seems still far distant and eludes the aspirations of mankind. God speed the day when their dream shall come true; when war shall be no more; when the battle flags shall be furled, in "the parliament of man, the federation of the world."

These heroes whose brows are decked with the laurel wreaths by their countrymen and shipmates and comrades felt in their hearts the immortal sentiment expressed by Lt. Kenneth McLeish, a valiant naval aviator who reached France in April 1917, and rendered signal service before he was shot down on the 14th of October 1918, the day preceding the evacuation of the Belgian coast, "and down these burning skies fell like a shattered star." That intrepid hero who sleeps in Flanders Field, shortly before he fell, wrote to his mother:

"If I must make the supreme sacrifice I will do it gladly and I will do it honorably and bravely as your son should. And the life that I lay down will be my preparation for the grander life that I shall take up. I shall live—you must not grieve! I shall be supremely happy. So must you. Not that I have gone west, but that I have bought such a wonderful life at such a small price and paid for it gladly."

Kenneth McLeish expressed the courage of all these shining souls who died so gloriously, our heroes and immortals.

Upon each grave here in Brest where men died, comforted in their last sleep by the lullaby of the waves they loved, and in all places where our heroic dead sleep, this inscription would typify their full devotion:

"Thus this man died leaving his death for an example of a noble courage and a memorial of virtue not only unto young men but to all his Nation."

Over these and all our precious dead, wherever they may rest, we may invoke the words of Pericles which come ringing down the ages; may pronounce over our own his eulogy of the Athenians who gave their lives to their country, as true today as it was 2,000 years ago:

"For having every one given his body to the Commonwealth, they receive in place thereof an undecaying commendation and a most remarkable sepulcher, not wherein they are buried so much as wherein their glory is laid up upon all occasions, both of speech and action, to be remembered forever. For famous men all the earth is a sepulcher; and their virtues testified not only by the inscription at home but by an unwritten record of the mind, which more than any monument will remain with every one forever.

"They are only happy that die honorably as these have done and to whom it hath been granted not only to live in posterity but to die in it."

We may well say of these, as was said of those heroes of long ago: "Whenever, in any time to come, men may speak of brave and noble deeds, these shall be held in remembrance."

Standing here in this ancient port, which hospitably welcomed a million American soldiers hastening to give the decisive strength for allied victory, who crossed the Atlantic safely because of naval protection from the perils of the deep and the submarine menace by American and French patriots who go down to the sea in ships; in the shadow of the Pontnezin barracks which housed Napoleon's militant troops, and where for a long period of the World War the marines, a valorous branch of the Navy, were official hosts for their brothers in arms as they departed for the western front; in appreciation of the people in Brest, honored by visits from President Wilson, Secretary Baker, General Pershing, Assistant Secretary of the Navy Roosevelt, and other American officials and officers, where ties of friendship and comradeship were formed which will ever be cherished by American sailors and soldiers; as one privileged in the Great War to be the one-time commander and the all-time comrade of the men of the invincible Navy of the United States and commissioned to keep safe the route of the ferry to France in the greatest ocean transportation in human history; and in the name of all the people of the American Republic, I dedicate this noble memorial to the memory of the officers and men, living and dead, of the American Navy, whose victory in the World War adds to the imperishable glory of America's first line of defense.

Nonspeculative Market for Farm Products

EXTENSION OF REMARKS

OF

HON. ARTHUR CAPPER

OF KANSAS

IN THE SENATE OF THE UNITED STATES

Friday, December 3 (legislative day of Tuesday, November 16), 1937

RADIO ADDRESS BY ERNEST D. MACDOUGALL, SPEAKING FOR THE NATIONAL GRANGE, ON AUGUST 21, 1937

Mr. CAPPER. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD a radio address on the subject of A Nonspeculative Market for Farm Products, delivered by Ernest D. MacDougall, of Washington, D. C., speaking for the National Grange, over the stations of the National Broadcasting Co. from Washington, Saturday, August 21, 1937.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

I see by the papers that prices of farm products are on the toboggan—that the farmers are beginning to be deflated again.

No businessman or manufacturer could long remain solvent if he were compelled, year after year, to market his products at ruinously low prices in an unprotected market, with expenses greater than income, having to draw continually on his capital in order to remain in business.

It is no wonder that farm tenancy is rapidly increasing. Farm income is only 10 percent of the total national income. Yet the investment in farm lands and equipment amounts to 20 percent of the total national wealth, and those who live and work on farms constitute more than 20 percent of the entire population of the United States. Farm income is only one-half of what it should justly be.

It is easy, of course, to point out difficulties under which our farmers labor to produce food for the Nation. What we should like to know is the answer to the problem. In principle, the answer is fairly simple. Let the marketing of farm products be conducted on the same sort of business basis as that on which the marketing of industrial products is conducted. Industry markets its products in a nonspeculative sellers' market, at profitable prices. Prices of industrial products, such as shoes and automobiles, are not fixed by speculators and gamblers, as are prices of the products of the farm. Prices of industrial products are protected also against foreign competition.

Farmers ought not to be compelled to sell in a gamblers' market in which prices continually fluctuate on the ticker tape. There is no ticker tape in the industrial merchandise market. It is not beyond human intelligence to devise a stable, nonspeculative market for farm products. Why do not our statesmen set themselves to that task?

The most glaring difference between the industrial market and the agricultural market is the presence of futures trading in connection with the latter. There is nothing like a futures market in the industrial field. Orders are sometimes taken in good faith for future delivery of industrial products, but that is entirely different in principle and in practice from trading in wheat futures contracts, cotton futures contracts, corn futures contracts, etc. A futures market is not a market for the future delivery of anything. A futures contract is a betting contract concerning future price quotations. Not more than one-half of 1 percent of the volume of wheat futures contracts results in delivery of wheat. Even then delivery of the wheat is not made in the futures market but in the cash market—the merchandise market. And it is a spot delivery, not future delivery. One must be very credulous, indeed, to believe that a futures market is a market for future delivery, when not more than one-half of 1 percent of the commodities ordered are actually delivered.

The courts have repeatedly condemned futures trading as gambling. A contract for the purchase or sale of commodities, where there is no intention to make or to take delivery, is a fictitious contract. Please note that word—a fictitious contract—a fake

contract; a gambling in the form of trade. This sort of gambling is well described by the Supreme Court of Illinois in the case of *Cothran* v. *Ellis*, as follows:

"It is not only contrary to public policy but it is a crime—a crime against the State, a crime against the general welfare and happiness of the people, a crime against religion and morality, and a crime against all legitimate trade and business. This species of gambling has become emphatically and preeminently the national sin. In its proportions and extent it is immeasurable. In its pernicious and ruinous consequences it is simply appalling. Its votaries and patrons are recruited from every class of society. Through its instrumentality the laws of supply and demand have been reversed, and the market is ruled by the amount of money its manipulators can bring to bear upon it."

These are not the words of a soap-box orator. They are the deliberately expressed opinion of the highest court in the State of Illinois. And the Supreme Court of the United States has held to the same effect.

Every farm organization in the country has protested against gambling in the necessities of life. The National Grange has been particularly active in urging upon the Congress the enactment of legislation to put a stop to grain gambling.

In 1922 the Congress enacted the Grain Futures Act. The Grain Futures Administration, which was set up by the act, served a valuable purpose as a fact-finding agency of the Government, but it had no power to regulate futures trading or to limit the gambling operations of the futures markets. The Grain Futures Act of 1922 lacked teeth. This led to renewed agitation for further legislation to cure the evils of futures trading.

In 1936 the Congress enacted the Commodity Exchange Act, amending and putting teeth into the Grain Futures Act of 1922. The Commodity Exchange Administration has taken over the work of the Grain Futures Administration with increased powers of supervision and regulation. It has adopted rules and regulations for the guidance of futures contract markets, but these rules and regulations are not as stringent as the act authorized. There are plenty of teeth in the Commodity Exchange Act to stop gambling in the futures contract markets.

Here is a passage I should like to quote from the Commodity Exchange Act, section 4 (c), as follows:

"It shall be unlawful for any person to offer to enter into, enter into, or confirm the execution of any transaction involving any commodity * * * (A) if such transaction is, is of the character of, or is commonly known to the trade as a 'wash sale,' 'cross trade,' or 'accommodation trade,' or is a fictitious sale."

You will please note that the act expressly outlaws fictitious sales. I wish to quote also from section 2 (a) of the same act, in regard to the meaning of the term "future delivery." It says:

"The term 'future delivery,' as used herein, shall not include any sale of any cash commodity for deferred shipment or delivery."

In other words, the term "future delivery" does not refer to real or actual sales in the cash—the merchandise—market, but only to fictitious, pretended sales in the futures market. That is not your idea, nor mine, of the meaning of future delivery of actual grain. That is the gambler's idea of future delivery. It is said that futures quotations set the pace for cash prices. If so, it is to be observed that they set the pace downward. Futures quotations are usually lower than cash prices. That is especially true at harvest time, when farmers are marketing their crops.

One thing the futures market does do to the cash market. That is, it unsettles prices at all times and causes them to fluctuate without good reason. The futures market could not continue to exist in the absence of continual fluctuation of prices any more than betting on the turn of the roulette wheel could continue if the wheel were not in motion.

Mr. Bernard Rothwell, of Boston, president of the Bay State Milling Co., Winona, Minn., in a radio address published July 13, 1932, in the Northwestern Miller said:

"During the brief 3¾-hours daily session of the Chicago Board of Trade wheat has often swung rapidly back and forth, back and fourth, 3 cents, 5 cents, 10 cents, and in one session 14 cents a bushel, making it impossible for the farmer, the country grain buyer, the miller, or the importer to tell within several cents per bushel the price of wheat at any particular moment.

"The difficulty of transacting legitimate business—production, manufacture, or distribution—in face of such wide fluctuations, the risks involved, and the actual losses liable to be sustained are self-evident.

"These daily fluctuations are not caused by the pressure of actual grain arriving from day to day, but by the operation of huge scale, politely called, speculators, more bluntly described as gamblers."

Millers and handlers of grain, as businessmen, do not like speculation. Some of them hedge in the futures market; some do not. Those who do hedge do so merely in order to nullify the evil effect of speculation on their business. They would much prefer to buy without hedging in a fairly stable market, as other businessmen buy in a stable market without hedging. It is the fluctuations of the futures market that bring hedgers into the futures market to protect themselves from price fluctuations which the futures market itself creates. The futures market came first, hedging came second in point of time. Futures contracts are gambling contracts. The Commodity Exchange Administration has power to put an end to them if it will. It remains to be seen whether it will do it or not. The futures market is the most uncivilized thing in our modern civilization. The futures market is causing a log jam in the stream of progress. Let's take it out!

Investigation of Charges of Coercion, Undue Influence, and Reprisal Among House Members

EXTENSION OF REMARKS

OF

HON. HAMILTON FISH

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Friday, December 3, 1937

Mr. FISH. Mr. Speaker, I presented a privileged resolution yesterday, but it was tabled upon the motion of the majority leader [Mr. RAYBURN] by a vote of 279 to 94. Every single Republican voted for the resolution, and in addition eight Democrats and five Progressives and Farmer-Labor Members.

The resolution did not in any way refer to the merits or demerits of the pending wage and hour bill. The charges contained in the resolution are not mine. They were made by distinguished Democratic Members of the House—I assume in good faith—and reflected seriously on the political integrity and honor of the House of Representatives.

In the 17 years I have served in the House I have always stood for social and industrial justice and a square deal for our wage earners, within the confines of the Constitution and our American system of government, and will gladly support a proper wage and hour bill.

I have repeatedly spoken in the House in favor of minimum wages and child-labor legislation. I have voted for most of the humanitarian legislation that has been enacted, including the social-security and old-age pension bills.

I am opposed to the principle of granting additional power to the President through the creation of a five-man Commission to further control and regiment industry and labor, as is provided in the pending hour and wage bill. I believe the time has come for Congress to take back some of the powers conferred by Congress on the President and restore representative government.

I agree with Mr. William Green, president of the American Federation of Labor, in his opposition to setting up a five-man commission to dominate and control wages and hours, as dangerous legislation, and destructive of the interests of labor and industry. If, in being against this feature of the bill, I am opposing humanitarian legislation, then by the same token Mr. Green, the head of the largest labor organization in America, is likewise against humanitarian legislation. However, I am willing to let my record in behalf of American wage earners and for a square deal for labor stand any political test.

The action of the huge Democratic majority in the House in tabling my privileged resolution for an investigation of the charges of deliberate trades and undue influence to force Members of the House to sign the petition to discharge the Rules Committee on the wage and hour bill practically destroys the last rights of the minority to protect the dignity, political integrity, honor, and prestige of the House of Representatives.

It was a most unfortunate partisan performance, and a serious blow at representative government. The parliamentary form of government, and our own legislative system, is under attack as never before, both from within and without the country. In Germany, Italy, Soviet Russia, and other countries the parliamentary system has been practically abolished. The action of the House majority today in refusing to even permit a free discussion of serious charges impugning the political integrity of its Members smacks of fascism and should be resented by Americans everywhere, regardless of party, who still believe in our representative form of government.

The charges I made emanate from distinguished Democratic Members of the House who had the courage to protest publicly against the vicious and un-American practice of political coercion and reprisals. If such malpractices

continue, it will mean the undermining and eventual destruction of our free institutions, including the House of Representatives itself.

This is not a partisan issue and should have been dealt with immediately, and a thorough investigation should have been made in order to safeguard the reputation and prestige of the House and its Members and to punish those responsible for such unethical practices.

If any Member is guilty as charged, from the Speaker down to the newest Member, he should be expelled from the House as an enemy of our representative and constitutional form of government which he has taken an oath of office to uphold.

The refusal of the Democratic majority to clear the fair name of the House is a sad commentary on the leadership of the present Congress.

The privileged resolution referred to, which was read in the House and tabled by a vote of the Democratic majority, is as follows:

House Resolution 366

Whereas it is stated in the public press that the gentleman from Texas [Mr. DIES] has publicly stated that: "They have swapped everything today but the Capitol. They have traded and promised Members everything to get them on that petition. They even told the Florida delegation they would get the Florida ship canal, I heard, if they signed. They promised so much there won't be anything left for the Federal Government"; and

Whereas the gentleman from Virginia [Mr. ROBERTSON] is quoted in the public press as having stated on the floor of the House: "Charges the House farm bill was being made a 'purely log-rolling proposition' to get signatures on the wage and hour petition were openly made in the House of Representatives by Representative A. WILLIAM ROBERTSON, Democrat, of Virginia. He spoke of efforts to 'trade support for the farm measure in return for support for wage and hour measure.' 'Reprisals are openly threatened,' said ROBERTSON, 'if southern Members who conscientiously believe that the pending wage and hour bill is fundamentally unsound and inherently unworkable do not promptly march to the Clerk's desk and sign the petition to bring up the wage and hour measure' ": Therefore be it

Resolved, That a special committee consisting of five Members shall be appointed by the Speaker to investigate such statements and report its findings and recommendation to the House of Representatives.

The Compulsory Crop Control Bill (H. R. 8505)

EXTENSION OF REMARKS

OF

HON. J. PARNELL THOMAS

OF NEW JERSEY

IN THE HOUSE OF REPRESENTATIVES

Thursday, December 2, 1937

Mr. THOMAS of New Jersey. Mr. Speaker, with the exception of the first few years of my life, I have always lived in the country; and while the little borough in which I live can no longer be called a farming community, it is still rural—so rural that one who has lived there would naturally acquire an appreciation of the interests and the problems of farming people. Nor could one fail to take a vital interest in farm legislation. As there are some 750 farms in my own county and over 6,000 farms in my congressional district, it is perfectly natural, therefore, that I should have a sincere interest in the welfare of the man or woman who endeavors to earn a livelihood by way of the farm. I think also that I know the farmer in my district and in my State. I think I know his attitude toward both State and Federal farm legislation. At least, I have tried to understand what he is up against and what he most desires. If I judge him correctly, he is a hard-working, thrifty citizen, and as industrious and as thrifty as any people in any part of the United States.

The New Jersey farmer, unlike the farmer in many other States, particularly those in the South, long ago realized the benefits from diversification. As definite proof of the marked crop diversity in New Jersey, the United States Census of Agriculture (last publication) shows us that from the farms reporting, the value of wheat threshed in New Jersey in the year amounted to over $1,000,000, oats threshed, over three-quarters of a million dollars; rye threshed, over one-third of a million dollars; corn harvested, $4,800,000; Irish potatoes $4,474,000; sweet potatoes, $2,076,000; hay, $6,234,000; eggs, almost $10,000,000; chickens raised, over $7,000,000. And last but not least, there were about 100,000,000 gallons of milk produced. These are but some of the important farm crops in New Jersey.

The New Jersey farmer has always endeavored to work out his own problems—believes that the best results come from his own initiative and not from governmental Christmas presents. He believes in the democratic form of government, and regardless of his politics, he believes in American institutions and in the tried American principles of democracy. He is not the type of farmer who is waiting around for the Federal agent to come with the Government pay check for the land which he did not use, or for the hogs which he did not sell, but he is up early in the morning, works hard all day, in hot weather and in cold, until after dusk. He is enthusiastic, thirfty, home-loving, a true believer in God, and full of courage.

If I judge him correctly, he is not the type of American citizen who would be in favor of the crop-control legislation which we are debating this week, nor in fact would such legislation be to his advantage.

Up to now I have not received one word from any New Jersey farmer asking me to support this crop-control bill. I have, however, received a number of requests that I vote against it, including one telegram from a person high up in farm administration and farm circles in New Jersey, which telegram clearly and definitely points out that the New Jersey farmers "are not in accord with the restrictive legislation leading to compulsory production or control," and that they do not believe that "acreage from restricted production should be used to grow other crops for market." The same telegram states, however, that "they favor the present Agricultural Conservation Act."

Such a feeling toward the crop-control bill on the part of the people from New Jersey who have contacted me relative to it, is easily understandable, for if the bill should pass in its present form, it will undoubtedly work a real hardship on New Jersey farmers, particularly the dairy people. First of all, the bill is viciously sectional, clearly favoring the southern and western farmer. It will raise the price of many of the products which are consumed by our eastern farmers, while at the same time it will encourage the western and southern farmer to grow and raise farm products on land taken out of production which products must necessarily compete with those of the eastern farmer; particularly will this competition be felt by the eastern dairyman. In addition, the bill will tend to take away from the New Jersey farmer—in fact, from all Eastern States farmers—the last vestige of independence which our eastern farmers have left and which they have for so long enjoyed.

The bill's sound features are unfortunately warped into insignificance by its unsound parts. What might have started out as sound legislation ended up as a heterogeneous collection of pet theories based on conditions existing in the South and in certain parts of the West. Certainly it does not represent an expression of opinion of a majority of the farmers in the United States, for a bulletin from the National Grange by Congressmen the other day, is definitely unenthusiastic as to the contents of such control legislation.

Its crop-control feature, incidentally, will probably turn out to be the bill's most harmful feature, for once a quota is imposed on the farmer he can sell not more than the quota fixes. If he produces more than his quota he is not allowed to sell the excess, but must store it himself. If he has no suitable place in which to store it he must build such a place at his own expense and according to governmental specifications. The farmer must keep detailed and voluminous records, all of which will add to his costs of production. If he violates any of the provisions of the act, even though

unwittingly, he must pay a penalty. And, believe me, if the farmer has as hard a time to read and understand this 86-page complicated act as I have had in my study of it over the past few days, it will be quite unusual if he does not violate the law many times during the first few years it is on the statute books.

Then, of course, there is a strong possibility of the new act being declared unconstitutional, as was the A. A. A. At this point I wish to read a paragraph taken from the minority report of the standing Committee on Agriculture of the House of Representatives:

> It is said that there are those who believe that certain proponents of this type of compulsory legislation (who are not Members of Congress) are very anxious to have enacted into law legislation which is obviously unconstitutional and which will be so declared by the highest Court, in order to provide new life for a continued attack upon the Supreme Court. This is not the way we should do business, for prejudice and class hatred of this character have no place in our American system if we are to continue as a free democracy. When changes are needed in our governmental system the people can bring them about in a constitutional manner without the necessity of hatred or intimidation.

But one of the bill's most vicious features, as far as it may affect our New Jersey farmers, is the total lack of consideration for the dairy farmer as well as the subsidization of southern and certain western farmers in order that they may compete with the eastern dairy farmer.

Dairy farmers naturally do not object to other farmers going into the dairy business, but they must object to the Government practically saying to other farmers "You must not plant cotton or some other crop on a certain portion of your land, but it is acceptable to the Government if you graze cattle on that land, from which milk may be sold in competition with the now existing dairy farmers." In fact, the Government practically says, "If you do not grow cotton or some other crop on part of your land, we, the Government, will pay you." So, in effect, the cotton farmer is paid to go into the dairying business in competition with our own New Jersey dairymen. This, of course, is a hypothetical case, but it is one practical way which this bill, if enacted into law in the form in which it came to the floor of the House, may work out.

There are also other bad features to the bill. Its utter violation of the economic law of supply and demand, its tremendous estimated cost—some $700,000,000—$200,000,000 more than even the President asked for. The huge administrative cost of approximately $45,000,000; and, as you know, there are already some 60,000 people on the Agriculture Department pay roll—over twice as many Government employees in this one Department as there are farmers in all of the State of New Jersey. Then there is the possibility that it may result in a further increase in our farm imports over our farm exports. The National Grange, in its annual report just published, has already told us that for the first 6 months of 1937 the agricultural imports amounted to $1,151,028,222, as against agricultural exports during the same period of only $435,099,385.

So, after weighing all of these adverse factors with all the good factors in H. R. 8505, the compulsory crop-control bill, I am of the opinion that the bill would be definitely injurious to the New Jersey farmer—the farmer who desires and deserves encouragement rather than discouragement, justice rather than injustice, and who so wants to be left alone so that he may work out his own salvation in his own peaceful way, without being hampered and hamstrung by uneconomic governmental theories and experiments. It is true that the New Jersey farmer welcomes governmental advice as everyone welcomes advice of some sort, but he doesn't want to be made a pawn of bureaucracy.

I am quite sure that when the New Jersey farmer has an opportunity to carefully study this compulsory crop-control bill which we have debated over the past week, he will throw up his hands in disgust. I am equally sure he will quickly discern the two little "bogies" in the woodpile—King Cotton and more political pap, all dressed up as agricultural relief.

Furthermore, I predict that this legislation, if it passes in its present form, will be more injurious to the farmers throughout the entire Nation than any farm legislation ever passed by any Congress.

The Farm Bill

EXTENSION OF REMARKS
OF
HON. NOAH M. MASON
OF ILLINOIS
IN THE HOUSE OF REPRESENTATIVES
Friday, December 3, 1937

Mr. MASON. Mr. Speaker and Members of Congress, I am opposed to H. R. 8505, the administration's plan of compulsory control of the farmers of the Nation, for the following reasons:

(a) I am opposed to compulsory control by the Government over the farmers planting and selling which the bill provides. I am for voluntary control through soil-conservation payments and crop loans to peg the price and provide an ever-normal granary.

(b) The provisions of this bill will not bring about desired parity prices nor prevent low prices for farm commodities. Its authors and supporters acknowledge this, and Earl Smith, president of the Illinois Agricultural Association, agreed that this is true.

(c) The bill will give the cotton planters of the South a bonus for not growing cotton, but will permit them to grow instead soybeans, clovers, alfalfa, and grasses for dairy purposes, build up herds, and complete with the dairy farmers of northern Illinois, Wisconsin, and Michigan, getting a bonus from the Government for doing so. The dairy farmer will be badly handicapped in this way by the provisions of the bill.

(d) The provisions of the bill for acreage allotments, especially upon cotton, are unfair and biased in favor of the South. California's present cotton acreage will be cut 61 percent, Oklahoma 3 percent, Alabama 15 percent, North Carolina 12 percent, and Texas 15 percent.

(e) For a government to restrict its own farmers in the production and sale of crops and at the same time invite the farmers of other nations to ship one billion dollars' worth of farm products into this country (the amount shipped in last year) in competition with the products from our own farms seems to me neither wise nor sound.

(f) The compulsory corn acreage and sales quotas contained in the bill apply only to the 10 commercial Corn Belt States that grow three-fifths of our corn crop, but do not apply to the other corn-growing States that grow two-fifths of our corn crop. This is certainly discriminating as it applies to the 10 Corn Belt States.

For the foregoing reasons, Mr. Speaker, I am opposed to the farm bill in its present form.

Reorganization Program Aims To Extend the Civil Service

EXTENSION OF REMARKS
OF
HON. JAMES M. MEAD
OF NEW YORK
IN THE HOUSE OF REPRESENTATIVES
Friday, December 3, 1937

Mr. MEAD. Mr. Speaker, in my opinion, there is no problem among the many now pending before this Congress—there have been few problems dealt with by any Congress more vital or more essential to the preservation of this great democracy than governmental reorganization. It may not

have all the immediate cogency of a farm program or a wage and hour bill, but, from a long-range viewpoint, I believe that reorganization legislation is of more fundamental importance than either of these vastly important matters.

It has, therefore, been a matter of real concern to me to see in some quarters a complete and, in few cases I might say, a willful misunderstanding of the real meaning of reorganization legislation. It has been viewed with studied alarm by certain persons as a sinister move to extend enormously the powers of the President and make this a one-man Government in a way wholly repugnant to the spirit of the Constitution and never contemplated by the people.

Nothing could be further from the truth. Indeed, all the history and background of reorganization legislation is a clear refutation of this charge. Reorganization legislation is not new. Since the memory of man goeth not to the contrary it has been a stepchild of Congress, occasionally considered in part though never in whole, but usually pushed aside to clear the way for more pressing legislation. The time has now come when it can no longer wait. The administrative machinery of our Government is badly in need of overhauling. The many new duties and functions which have been imposed upon it in recent years as a result of the economic crisis have served to accentuate defects which have already, in many cases, gone too long unchallenged.

The present Congress has the opportunity and the duty to deal with this subject not merely in one of its isolated phases, but as a broad-gaged general program. It is my confident prediction that whatever other legislation may be enacted by the Seventy-fifth Congress the enactment of reorganization legislation—and I sincerely hope it will become law during the present session—will be the chief claim of this Congress to honored remembrance.

The Government of the United States has grown from very small beginnings to its present tremendous stature in the relatively short space of 150 years; but, there has been nothing functional in this growth. It is just as if you started with a small bungalow and changed it in the process of years to a great mansion by the device of adding a room here and a wing there as the need arose. The result would probably be a little queer. Your kitchen might be a long way from your dining room and the people in some of the outlying bedrooms might have to walk a mile to meet in the living room—but, you would have a house, and if you had lived in it a long time, you might not even notice that there was anything wrong with it.

It amazes all of us when we stop to consider how complicated our Government is today, and how comparatively recently it was so simple that even a child could understand its organization. As late as the nineties, to give a homely illustration, there was only one telephone in the entire Department of Justice. It was on the fifth floor, and the Attorney General's office was on the ground floor. When someone called up the Attorney General, a clerk had to walk down five flights of stairs and tell him, and the Attorney General had to walk up five flights to answer the telephone. Perhaps that did not make so much difference, because all the problems that the Attorney General had to grapple with at that time were not of earth-shaking importance. They tell the story of a day when the Attorney General wanted to go to a ball game. So did the other officers of the Department—there were not very many—so the entire staff of the Department of Justice spent the morning wrestling with the legal problem, whether a colored messenger could be designated Acting Attorney General for pro forma purposes during the afternoon. Those of you who have tried recently to find out which subdivision of which bureau of which agency is handling a particular matter realize how different things are today.

It is an axiomatic truth that the National Government of this country is of first importance to the citizens of the United States. Modern government must be strong, intelligent, efficient, coordinated, and economical. If it is not, it will fail to perform those services which the people demand of it. It will be unable to deal with new and changing difficulties. It will bungle and muddle and waste. It will precipitate one emergency after another. It will collapse and may even be abandoned for dictatorship merely in the hope of getting unified and swift action. Government, like business, follows great economic laws of supply and demand. Government, like business, is cruelly competitive. If any government, however sound its theories, however noble its aspirations, becomes inefficient in the execution of its governmental functions, becomes unable to adjust its faculties to the ever-changing kaleidoscopic world in which it exists, it will not survive. Some other form of government, perhaps more cruel, more rapacious, less sparing of human rights and liberties, but more efficient, will take its place. You remember Shelley's Traveler from an Antique Land, who describes seeing in some remote desert two vast and trunkless legs of stone and near them in the sand, half sunk, a shattered visage—

> Whose frown,
> And wrinkled lip, and sneer of cold command,
> Tell that its sculptor well those passions read
> Which yet survive, stamped on these lifeless things,
> The hand that mocked them and the heart that fed.
> And on the pedestal these words appear—
> "My name is Ozymandias, king of kings:
> Look on my works, ye Mighty, and despair!"
> Nothing beside remains. Round the decay
> Of that colossal wreck, boundless and bare
> The lone and level sands stretch far away.

Even in those days, it appears, Government was competitive. Now, it is true that our democracy has survived for a century and a half and flourished among competing forms of government of many different types and colors, old and new. It is true, too, that from time to time decay, destruction, and death of democracy have been gloomily predicted by false prophets who mocked at us. But our American system has matched its massive strength successfully against all the forces of destruction through parts of three centuries. All this is true and it means much, but there are many things that it does not mean. We cannot become sluggish and lazy. We cannot point to our past laurels and say, "For 150 years American democracy has been preeminent among the governments of the world; it will always be so." How many centuries was Greece preeminent, and Rome, and Spain, and Portugal? It may not always be so. It may not even be long so unless we make it so. The fundamentals of our Government are sound, as they have always been, but the superstructure is in some respects as outmoded as that of the first automobile. We must functionalize and streamline our Government in a manner analogous to the evolution of the automobile lest some other "maker" lure the people away with eye-filling vistas of long sleek body lines hiding an unsound engine.

In a practical country like ours we insist upon and appreciate good management. Our people demand sound laws, but also sound execution of sound laws. It is not true that in giving to the Executive the necessary machinery of good management the Congress diminishes by just that much its own inherent powers. On the contrary, the dignity and authority of the Congress are actually strengthened by making easier the enforcement and administration of legislative decisions. The Congress does not pass laws in the spirit of New Year's resolutions but in the just and confident expectation that these laws will be put into practical effect in the speediest and best manner.

Beginning with the turn of the century, accentuated by the World War, and now made critical by the past depression, we have moved gradually into a new era, the era of administration. But the structure of the Government, with the exception of the introduction of civil service in 1883 and the Budget system in 1921, has not been changed to deal efficiently with this new age of administration. The weak link in American Government today is unquestionably administration. The time has now come to face this problem squarely and to reconstruct the administrative machine of the Government so that it may meet the requirements of

the new age of administration and, in so doing, to make certain that no element of popular accountability and control is lost.

The House Select Committee on Government Organization has reported four bills, the purpose of which is to deal fundamentally with the problem of administrative management in the Government of the United States and to make that management modern, efficient, economical, and democratic. Two of those bills, H. R. 8202, which gives reorganizing power to the President and creates a department of welfare, and H. R. 7730, which provides the President with not to exceed six administrative assistants, have already passed this House, but we will undoubtedly have further opportunity to consider them in conference. The other two bills, H. R. 8277, modernizing the civil-service administration and extending the merit system, and H. R. 8276, correcting the defects in, and modernizing, our present accounting and auditing system, have been reported favorably by the committee and are now pending on the calendar awaiting our consideration.

The Select Committee on Government Organization, of which I have the privilege to be a member, has, under the able chairmanship of the distinguished gentleman from Missouri [Mr. COCHRAN], carefully studied the subject matter of all these bills. In addition to its own hearings it has had available to it the past hearings of many congressional committees upon the subject of reorganization, as well as a great deal of disinterested expert advice. For purposes of convenience, the committee divided the reorganization problem into four parts, each one of which became the subject of one of the bills to which I have referred. The committee divided itself into four subcommittees and to each assigned one of these parts. I myself served on two of these subcommittees. One of these subcommittees considered the accounting and auditing system of the Government, the other, of which I had the privilege to be chairman, considered matters affecting the civil service. I did not, however, limit myself to these two problems alone, but have attempted, within the limits of my ability, to give the most careful study to the subject matter of all four of the reorganization bills.

I wish briefly now to discuss the provisions of each of these bills for the benefit of those of you who have not had an opportunity to examine them since the end of the last session.

First. I will first discuss H. R. 8202, which gives reorganization powers to the President and creates the Department of Welfare. This bill reenacts title IV of the Economy Act of June 30, 1932, as amended, with certain minor additions and important limitations. It thus authorizes the President to investigate the existing organization of the various executive and administrative agencies of the Government and under policies and limitations which are set forth—these pertain to such matters as increasing the efficiency, elimination of overlapping and duplication of effort, and so forth—to regroup, consolidate, transfer, or abolish agencies and functions.

The authority granted to the President by this bill is considerably less than that granted to him in previous legislation. His power to make transfers affecting independent commissions and boards charged by law with regulatory functions is strictly limited, though no such limitation was provided in the 1932 act. The only authority granted to the President with respect to the independent regulatory commissions and boards is that which will enable him to exercise a salutary budgetary supervision over such agencies. This is necessary if we are to have a sound Budget applicable to all agencies of the Government. Within recent years there has been a tendency of some independent commissions and boards to regard themselves as above any budgetary review by the President. This is contrary to the intent of the Budget and Accounting Act of 1921; it is contrary to the principle of Executive responsibility to the Congress.

The bill also embodies the provisions in the 1932 act, as amended, that any Executive order issued under the authority of the act had to be submitted to Congress while in session and did not become effective until 60 days thereafter, and that the grant of authority to the President was limited to a period of 2 years from the date of enactment. As part and parcel of the reorganization plan, H. R. 8202 also creates a new Department of Welfare, which is charged with the promotion of public health, education, and welfare activities of the Government. The bill, however, does not contain any provisions authorizing wage cuts, payless furloughs, or the involuntary retirement of personnel.

There is nothing new or unprecented in legislation authorizing administrative reorganization by the President under policies and limitations set forth by Congress. Such authority was granted to the President in connection with the creation of the Department of Commerce and Labor in 1903 and the Veterans' Administration in 1930. The Overman Act of May 20, 1918, gave him that power for wartime purposes. In 1932 Congress gave broad reorganization powers to President Hoover under the Economy Act of June 30 of that year. That act was extended and amended on March 3, 1933, and again on March 20, 1933. It is reenacted by this bil' with substantial limitations.

The need for administrative reorganization and a reduction of the administrative agencies of the Government is apparent to all. The President's Committee on Administrative Management has testified that there are at present in the Government 133 separate departments, commissions, boards, authorities, and other agencies. This multiplication of independent agencies defeats the ends of efficient and economical administration of the affairs of Government. A thoroughgoing reorganization has been needed for years and is more imperative now than ever before. Repeated efforts during the last 17 years by the Congress to enact the detailed reorganization have proved to be futile. A considerable amount of reorganization was accomplished by the President under the authority of the act of June 30, 1932, before it expired, through the issuance of a number of Executive orders, but the attention of the administration during this period was necessarily turned to the urgent problems created by the disastrous depression, and the real task of administrative reorganization had to be postponed until a more favorable time. That time has now come.

Second. The next bill is H. R. 7730, which, like the bill I have just discussed, has already received the approval of this House. This bill authorizes the President to appoint not to exceed six administrative assistants and to fix the compensation of each at a rate of not more than $10,000 a year. The purpose of this bill has been so thoroughly discussed, both in this House and in the public print, that I do not feel it necessary to elaborate on its objectives. You all know that the work of the office of the Chief Executive has steadily increased in magnitude and complexity as our Government has grown. The President is overworked. Because he lacks sufficient assistance, it is necessary for him to concern himself personally with details which he should never have to consider. This bill will increase the efficiency of the operation of the Chief Executive's office, regardless of who the occupant may be.

Third. The third bill is H. R. 8277, which reorganizes and improves the administration of the civil-service laws and provides for the extension of the merit system upward, outward, and downward. This bill has been reported favorably by the committee after the most searching study and is now awaiting the consideration of this House.

The bill substitutes a single civil-service administrator and an advisory civil-service board of seven members for the existing Commission of three members. The work of the Civil Service Commission has increased almost 4,000 percent since its establishment, over 50 years ago. It is well known that the commission form of organization is unsuited to large administrative tasks. It is almost always slow, cumbersome, and inefficient when utilized for administrative functions. Its decisions are arrived at by compromise or by the domination of one strong member over the others. It is not suited to provide the constructive leadership, initiative, and vigorous administration needed in the central personnel

agency of the Government. It is significant that there is a growing trend in the States toward single-headed responsibility in civil-service matters.

In each of the five States which adopted new civil-service laws this year, the administration of civil-service activities was placed under a single personnel director instead of a commission. The civil-service board, provided for by H. R. 8277, will be advisory in character and will serve as the watchdog of the merit system. It will be composed of seven high-caliber, nonsalaried members drawn from business, industry, labor, and other walks of life. Its functions will be to oversee the administration of the civil-service laws and to make recommendations to Congress and the President for desirable and constructive changes. The stimulation of safety and health programs, the improvement of working conditions, and the establishment of adequate machinery for dealing with personnel grievances will be within the province of the board.

The bill also recognizes that the time has now come to extend the classified civil service to the great majority of positions now outside it. The new and emergency agencies created since 1932 were necessarily exempted from the classified civil service. It was not possible at the time of their creation to determine how long their activities would be continued and it would have been unwise to place them within the classified civil service at the outset. The situation has now changed. Positions and activities which are to be continued should be brought within the classified civil service without further delay. The bill will thus provide the machinery for a real career service in the Government. It will offer an opportunity to the rank and file of Government employees to advance through promotion to high positions of honor and distinction. This step is essential in the building up of a great civil service.

The bill also provides for the extension of the Classification Act of 1923, as amended, by authorizing the President to extend the provisions of that act to offices and positions not now subject to its provisions. This action, which has been long delayed, will provide for the uniform application of definite salary standards and the more careful budgeting of personnel services.

Fourth. The last of the reorganization bills, but far from the least important, is H. R. 8276, which revises the Government's accounting and auditing system in some very desirable respects. Like the civil-service bill, it is now awaiting the consideration of this House.

The purpose of the bill is to strengthen the Budget and Accounting Act of 1921 by amending it so as to carry out the original intention of Congress in enacting that act, namely, to provide Congress with an independent audit of the receipts and expenditures of the Government by an agent directly responsible to the Congress. As will be recalled, that act vested in a single agency, to wit, the General Accounting Office, the functions of settling and adjusting accounts and claims and rendering advance decisions involving the expenditure of public funds as well as the functions of criticizing such settlements and adjustments and reporting its criticisms to the Congress. The purpose of this bill is to segregate the functions of settlement and adjustment under one officer and the functions of reviewing and criticizing such settlements and adjustments and reporting thereon to the Congress in another officer directly responsible to the Congress, and thus provide the Congress with an independent audit.

The present bill is the result of careful consideration by the Select Committee on Government Organization and involved the sifting of many alternative proposals as to how the desired objectives could be obtained. The plan of the bill is to leave in the General Accounting Office the functions now exercised by it in respect to the settlement and adjustment of accounts and claims and the rendition of advance decisions involving the expenditure of public funds. The Comptroller General hereafter will serve without term and will be subject to removal by the President. This is a recognition of the fact that the functions left in the General Accounting Office, as distinguished from auditing functions, are executive in character and the officer vested with them should be responsible to the President.

In order to furnish the Congress with an independent audit of receipts and expenditures by an officer other than the one who settles and adjusts accounts and claims and renders advance decisions involving expenditures, the bill provides that there shall be in the General Accounting Office an Auditor General of the United States, who shall be an agent of the Congress, and shall exercise the functions of his office without direction from any other officer. The Auditor General will be appointed by the President, with the confirmation of the Senate, but can be removed only by a joint resolution of the Congress or by impeachment. He will hold office for a period of 15 years.

Under existing law the Comptroller General is both an auditing and an accounting officer. Under this arrangement he is placed in the anomalous position of being required to settle accounts and claims and then report to Congress his criticisms of his own settlements and adjustments. Obviously, under such an arrangement it is impossible for Congress to obtain an independent audit of the settlement and adjustment of accounts and claims. H. R. 8276 corrects this situation.

It would take too long for me to expatiate on the minutae of this important bill. I wish to state, however, that I believe that in addition to retaining and strengthening all of the protective features of the present system it will also mark a constructive step forward toward greater efficiency in the set-up of the Government's accounting and auditing machinery.

Let me say in conclusion that the Congress of the United States has too often considered ways and means of improving the administrative machinery of the Government and too seldom has done anything about it. Such measures as have been adopted have never covered the whole landscape. A step has been taken here and a move has been made there, but we have never pushed forward on all fronts; we have never circled the horizon. This is true because one of the unfortunate characteristics of reorganization legislation is that it can almost always wait. Wars, floods, famines, and depressions must be dealt with instantly; but if the administrative machinery of the Government is rusty and outmoded, we have in the past been able to apply a little oil here and there and still creak along a few more years with the old-style model. The point has been reached, however, when we can no longer employ stopgap measures. We must act, and we must act now or we will be gravely derelict in our responsibilities.

We have before us a carefully planned, broad-gaged reorganization program. As I have indicated, the need for it is greater than it has ever been before, because of the growth of our Government and because we have gone so long without attacking the problem with all our energies. It is the opportunity and duty of this Congress to enact at this special session, if possible, a general reorganization program. I say to you now, as I said in the beginning, that if we do so, it will be the principal claim of the Seventy-fifth Congress to an honorable place in the memory of the people of the United States.

National Labor Relations Board—Weirton Steel Case

EXTENSION OF REMARKS

OF

HON. H. STYLES BRIDGES

OF NEW HAMPSHIRE

IN THE SENATE OF THE UNITED STATES

Friday, December 3 (legislative day of Tuesday, November 16), 1937

Mr. BRIDGES. Mr. President, under unanimous consent granted me, I insert an article from a magazine and one from a newspaper, as follows:

[From Mill and Factory Magazine, October 1937]

THE TRUE STORY OF WEIRTON

(By Hartley W. Barclay)

For the best show of the year—go to Weirton. What comedy! What tragedy! What a colossal burlesque staged with taxpayers' money! What a curse to democracy! What a lot of expensive Wagner Act nonsense! What a silly waste of money! Of course, these are my own conclusions. But they are not based upon swivel-chair observations. They are based upon scores of personal interviews with all the individuals most concerned with and affected by the National Labor Relations Board trial of Weirton Steel Co. on charges of an unprecedented and all-embracing character. I saw and talked repeatedly at day and at night with all kinds of workers, in the mills, in their homes, on the streets, at a wrestling match, at their magnificent swimming pool, in the meeting of the men's choir, around the dingy court room in which the trial is being held, and in my own room in the Fort Steuben Hotel at Steubenville, Ohio. Their statements are important because it is reasonable to assume that what is going on here is typical of what is going on in a lot of places where similar hearings of the N. L. R. B. are being held. Most of the workers expressed quite original opinions as to why they thought the trial was being conducted. One worker said, "Kenny Koch, the C. I. O. organizer, told me that John Lewis can get the N. L. R. B. to crack down on any company that won't sign up with C. I. O." Another worker said, "The C. I. O. told me that President Roosevelt wants us to join them." Others said, "When I went to a C. I. O. meeting they told me the N. L. R. B. men stand all around town telling everybody they are going to 'free the slaves'—but of course we know that they are just holding down easy jobs."

THE JUDGE, JURY, AND PROSECUTOR

I had dinner with National Labor Relations Board Trial Examiner "Judge" Edward Grandison Smith, a lovable old small-town West Virginia lawyer who does not know a thing about the wages of steel-mill workers who operate ladle cranes or work on open-hearth floors and, therefore, who apparently cannot realize that some of the Weirton workers make more in the mill than the $35 per day which he is said to receive for uplifting them. He appeared to be quite interested in the news which I brought him of the mine fire which occurred in 1884 in the nearby Ohio coal fields as a result of labor violence. The fire has been raging for 54 years, and to the employees of Weirton whose fathers, grandfathers, and grandmothers found an object lesson in that huge conflagration the ever-burning coal fields, stretching more than 110 square miles in the immediate vicinity of this tri-State region, serve as a constant warning of the futility of certain kinds of industrial relations methods, some of which appear to be endorsed now by the N. L. R. B. "Judge" Smith has never been a real judge. His right to the title of judge is not even as valid as is a Kentucky colonel's right to the title of colonel. He was admitted to the bar in 1893. He told me that he first became interested in the problems of industrial relations when he was a student at Washington and Lee and won an intercollegiate oratorical contest on his theme of "Plutocracy"—and he has been polishing off the same subject ever since. "Judge" Smith cannot be blamed for the unfortunate aspects of this ridiculous inquisition, because under the Wagner Act he is prevented by the language of the act itself from permitting the usual rules of court procedure to apply in any case, and the National Labor Relations Board has not seen fit to establish any floor or ceiling to the nature of the methods of persecution and prosecution adopted by its representatives. "Judge" Smith has an open mind, because he listened with attentive interest while I told him of some of the interesting things I had seen during the past year which had not previously come to his attention—things like the ruinous bootlegging of anthracite coal in Pennsylvania by employees of the W. P. A. and members of the United Mine Workers, among others—things like the closing of plants permanently and loss of jobs to hundreds of workers as a result of ruthless labor wars. "Judge" Smith is a member of Phi Beta Kappa, and his key appears prominently on his vest. He is also the president of the board of trustees of West Virginia University. He particularly enjoys talking with his professors about Shakesperean and Elizabethan literature. Nevertheless, he should realize that Weirton Steel Co. has brought opportunity rather than industrial oppression to many deserving people, because he told me that one of the high officials of the university got his start on the road to success working in the Weirton mills many years ago.

THE COMEDY OF IT

High lights of rip-snorting comedy provides a welcome relief from the depths of tragedy to which certain phases of the trial have plunged. When the attorneys for the National Labor Relations Board, with supercilious smirks, announced during the trial that the only statement upon which they could agree with Weirton counsel was "that that table is a table"—C. I. O. observers and Weirton loyal workers alike roared with unrestrained laughter. When on cross-examination a witness for the National Labor Relations Board was brought to explain how he could have stood a distance of one long city block, plus one-half of another block away from a closed sedan faced the opposite direction, and see the smile on the face of the driver when the driver turned to talk to men in the back seat of the car, and because of that smile could psychoanalyze and read the mind of the car driver, the pitiful hopelessness of this crude attempt at an effective hoax exploded the funny bones of scores. It was high comedy when the Weirton attorneys called attention to the fact that a C. I. O. organizer was standing behind the witness chair, wearing a large revolver and an ammunition belt loaded with ammunition. It is equally mirth provoking when the citizens of Steubenville stand around on the corners of the city streets telling their story of how Trial Examiner "Judge" Smith went asleep on the bench during one period of the trial and an attorney for Weirton accidentally coughed, rudely awakening "His Honor," who through automatic reflexes immediately barked "objection overruled." His record at the end of 2 weeks of the trial was 455 objections of Weirton overruled against 19 N. L. R. B. objections overruled. The odds against Weirton, in the scales of the N. L. R. B. brand of justice, calculated on this basis looked as if they had dropped to 50 to 1 instead of 23 to 1 when I checked the record again September 21 to 25.

There is comedy galore when witnesses for the National Labor Relations Board made such startling admissions as, "I am not sincere (in what I say on the witness stand)," and another admits that he had not worked in the plant since months before the Wagner Act was passed by Congress. There is plenty of comedy, so much that often the scenes remind an observer of an endless comic strip of the type run on the funny page of daily newspapers, five scenes in each episode, each working up to a good gag.

The biggest and most ironic comedy of the whole thing is that when this "O. G. P. U."-like trial is concluded—and if the case goes to the Supreme Court, the review of the case will not and cannot be based upon whether or not a fair trial was held, because the Wagner Act does not provide for a fair trial. The review will be decided upon the basis of whether or not the trial was held as provided for under the Wagner Act. And since the act is faulty but has been sustained by the Supreme Court, a faulty conclusion in this case and in other cases will have to be upheld by the Court. That is what makes it seem so futile, to see Weirton attorneys and attorneys for 12,000 loyal workers who belong to an independent union and attorneys for the Community Security League, which is made up of the local citizens of the region, trying to protect rights and to follow procedures established by the Constitution and the Bill of Rights.

THE TRAGEDY OF IT

For those who are deeply concerned with all of the philosophical, legal, psychological, and industrial significances, effects, and implications of the trial—its gross tragedies wipe out all superficial comedy. The loss of business to the town—the growing fear of the future among local businessmen—the sales of securities by local investors and the hoarding of cash, the dearth of new construction which would speed ahead if the trial did not represent a menace to democracy in the minds of those who can afford to build—the unfamiliarity of the trial examiner with the realities of industrial operations at Weirton—the merciless plotting and scheming of the N. L. R. B. attorneys, who take advantage of every technicality for their own defense and make up their own new rules and interpretations extemporaneously to apply to Weirton Steel Co.—these things and scores of others not only constitute deep tragedy but in fact are a handwriting of dictatorship upon the wall of constitutional government. In these tragedies we can see how the rights of liberty guaranteed by the Constitution are being washed away one by one, and how the privileges of a free and democratic people are being changed to conform to a tyrannical creed.

The greatest tragedy of all is the fact that apparently none except the Weirton loyal workers and management and the local citizenry appear to be concerned about the fairness of the trial or the consequences of the apparently inevitable directed verdict by Trial Examiner Smith of, "I hold the Weirton Steel Co. guilty of the charges as named in the bill of complaint, and they are therefore directed to bargain collectively with the C. I. O." The way the farcical trial is being conducted there is not now and never has been any doubt about the outcome. The public will be led, as a result, to think that this predetermined verdict was the result of a fair trial because they will not know all of the real facts about it which they should know, and perhaps some will feel inclined to say, "Those dirty dogs who oppress labor ought to get convicted." The only reason that they will make this statement is because they know nothing about steel labor—Weirton working conditions—and they do not care about what the actual Weirton workers really want. They will overlook the fact that here 12,000 workers, making a minimum of $5 a day in the lowest wage classification in the plant (roughly about 7 percent or 8 percent of the total employment), and earning a maximum of $53 per day, not only do not want the C. I. O., but insist upon maintaining their own independent workers' union. They will overlook the fact that there can be no underprivileged among workers who earn average daily wages of $15, $18, $23, and on up to $30, with even higher peak wages. The public will know nothing about the real facts of the case, and some misguided folks who call themselves liberal will say "It's about time some reactionaries accept a new viewpoint on labor problems."

The Weirton employees have their own answer to such sloppy sentimentalists. They say, "This is no place for sissies." And they have their own good and sufficient reasons why in that plant there is no place for anyone who is not wholly and exclusively concerned with his immediate job and nothing else. They know why these fabulous Weirton wages are paid—the highest wages in the steel industry according to the workers—and probably the highest wages in any industrial organization in America. Higher than John L. Lewis agreed to for the auto workers, the rubber workers, the mine workers, and other steel workers. When huge ladles full of from 100

to 250 tons of molten steel are being swung through gaping space within the mill they know that it is too dangerous a place in which to listen to a C. I. O. speech on the Wagner Act. When white-hot bars, strips, plates, and sheets of glowing steel are swishing across the hot floors and leaping and crashing through the heavy mills, that is no place for speeches on John L. Lewis. And when the men go to their homes—80 percent of which at least are owned outright by the employees, most of them without mortgages—in this town 99 percent of the scores of workers with whom I talked do not want to discuss John L. Lewis there. When the C. I. O. offers the leaders of the independent union of mill workers as high as $20 per day to go to Pittsburgh and to sign up as C. I. O. organizers, most of them laugh at the offer, according to their stories, although perhaps the C. I. O. work would be easier they prefer their steady jobs in the mill.

There is great tragedy in the fact that America will never see this picture of the mills, and the tragedy is compounded by recent incidents. For example, when representatives of a Senate investigating committee attempted to take C. I. O. organizers into the mills to solicit members, when the representatives of the Senate committee refused to investigate the C. I. O. spy system, despite plenty of evidence, and refuse to pay any attention to the repeated beatings, violence, and intimidation of loyal workers in the mill and prefer to spend their time associating with C. I. O. leaders and to go out of their way to police the distribution of C. I. O. literature by known Communists. There is tragedy in the fact that the N. L. R. B. selected a C. I. O. organizer as their witness and he testified on the stand under oath during cross-examination that he was a Communist and was refused United States citizenship for this reason. There is tragedy in the fact that the trial examiner is obviously prejudiced in favor of the C. I. O. in the opinions of typical workers and that the C. I. O. is allowed to use spies to invade the offices of the corporation at night to get information which is admitted as N. L. R. B. evidence. There is tragedy when the N. L. R. B. introduced national politics into the trial when trying to prejudice the case by showing that their witness voted for Franklin D. Roosevelt for President. There is tragedy in the fact that the local constable, a C. I. O. organizer, goes around the town and the courtroom with a huge pistol strapped to his ammunition belt and serves N. L. R. B. subpenas at night, then spends his days idling about the courtroom. There is tragedy in the fact that there is no place in the trial for the production of evidence of the great social and economic contributions made to this community by Weirton Steel Co. in their work of turning a barren, ugly wilderness of West Virginia mountains into a thriving, peaceful, productive community of fine homes, schools, churches, and amazing incomes. There is tragedy in the fact that convicted criminals are allowed to testify for the N. L. R. B. and that the transcript of the trial is composed almost entirely of hearsay evidence which is incompetent, irrelevant, and immaterial. There is tragedy in the fact that a part of the complaint of the Government is that Weirton Steel Co. dominated the social life of the community when the facts are that the company has encouraged the development of social freedom by encouraging the growth of schools and churches and recreation by donating sites and equipment which could have been made available otherwise only by a longer and more difficult process of progress. There is tragedy in the fact that many townspeople fear the activities of the N. L. R. B. combination with C. I. O. so greatly that they compare it to the celebrated O. G. P. U. and will not discuss their opinions openly in public for fear of being overheard and subjected to reprisals. There is tragedy when factory workers who can afford to spend money for luxuries out of wages ranging from $5 minimum to $53 maximum per day hoard their cash in fear of a shutdown, due to expected disorder which they believe will result from the activities of the N. L. R. B.-C. I. O. combination. There is tragedy in the contrast between the N. L. R. B. portrayal of the C. I. O. as being composed entirely of heroes, martyrs, and public benefactors and the Weirton Steel Co. and its loyal workers as enemies of all good things of life. Yes; there is plenty of tragedy here, and it all developed out of the hopeless misunderstanding of the real ideas which Senator WAGNER had in mind when he wrote the Wagner Act and in the failure of Congress to clarify the act and equip it with proper machinery for administration.

THE N. L. R. B.-C. I. O. COMPLAINT

Although there are some other items in the N. L. R. B.-C. I. O. bill of complaint, the most important and principal complaint is the blanket indictment included in paragraph F, which charges that Weirton Steel Co. has exerted a preponderant influence upon and has dominated the government, the administration of justice, the political, business affairs, and social relationships of the community to the serious prejudice of the liberties of its employees. In other words, the Government is seeking to prove that the free men of Weirton are not in fact free men, but are slaves, and should join the C. I. O. in order to attain emancipation. Unfortunately for its case, the Government did not realize that the workers in Weirton are so independent that they tell anyone to "Go to hell" whenever they feel like it. They asked Congressman ARTHUR P. LAMNECK, of Ohio, whether they had to join the C. I. O. He said, "Select your own leaders and let them deal with your company. If that does not suit John Lewis, tell him to go to hell." They did just that—they told John Lewis to go to hell. But he is not satisfied, and the N. L. R. B. says "Nix." People in this region have so much spending money that the town of Steubenville, just across the river, is noted as one of the greatest gambling centers north of Miami, Fla., and the workers are so healthy that you can hardly name a single great college or university east of the Mississippi River and west of New England in which at least one Weirton worker has not been a member of the football squad during the past 10 years.

The Government is trying to prove that the community has "gone to hell in a bucket" because the Weirton Steel Co. has given some real civic improvements to the town of Weirton and takes a pride in better homes, education, health, and recreation. In other words, the company is damned if it does not distribute the wealth and, according to the N. L. R. B., is damned if it does. "Right or wrong, the company be damned," seems to be the best summary of the entire affair.

That is where the company employees disagree with Uncle Sam's New Deal stepchildren. The C. I. O. is no sacred cow to them, and they do not want Uncle Sam to tie them up to his sacred cow. They think that the starry-eyed boys who drew up the amazing N. L. R. B.-C. I. O. document were carried away in their zeal for New Deal-C. I. O. reform. They have no doubts about their attitudes. The company did not dominate their politics when they voted overwhelmingly for Roosevelt while some of the company officials were perhaps unwisely so bold as to believe that the officials could vote the Republican ticket without harvesting New Deal reprisals. This same dominant spirit of independence makes the workers insist upon independence from John L. Lewis or any other labor boss except the ones that they elect themselves in their own elections.

THE MELTING POT OF NATIONALITIES

You have to talk with a lot of workers to get the real atmosphere of Weirton. You have to visit them in their homes, have them tell you about their wages and savings accounts, their sons and daughters, their sports, and their vital problems. Then, and only then, you realize that this is a unique section of America. It is a lusty, full-blown, healthy, hard-working, hard-playing melting pot of the first, second, and third generations of more than 50 emigrant nationalities plus native Americans dating back to the Revolutionary War. This is a place to which Italian, Polish, Russian, and Slav emigrants came 30 years ago to find social and economic opportunities which did not exist in their native lands. Now they are Americans and they are proud of it. They look upon their relatives in Europe as being the real underprivileged. Many have gone back to the old country for a visit, only to return to Weirton at their earliest opportunity to take a new pride in building a bigger and better industrial community. Many of these new Americans helped to build the original mills, erect the first walls, lay the pipe, install the machinery in the plants, and are proud of the part which they have played in the local drama of steel. For that reason, among others, the children of the new Americans work in the mills, too, but only after they have become 18 years of age. When these children save some of their wages, many of those who do not immediately marry and raise a family attend the best colleges and universities in America, where they are not in any way discriminated against because they have worked in the mills.

I looked through the mills for the underprivileged. I could not find them because they were not there. Every worker I talked with told me that he made more money and enjoyed better working conditions in the mill than he could find elsewhere. Even girls here made twice or three times the wages they could earn elsewhere, and it would be hard to distinguish them by their appearance from the best paid office workers in New York. Men in the mills did not hesitate to tell me their actual wages and to show me their earnings records. Many showed me the homes they had built, drove me around in their new automobiles. I went down to the worst street in town, the one published on page No. 37 of the September 13 issue of Life Magazine. From the illustration and caption in Life Magazine, every reader undoubtedly derived the impression, since the editors said "like most Weirton streets"—that this street is the kind of a place where the alleged dominated workers referred to by the N. L. R. B. are housed—where opportunity is alleged to have become a blind alley. I talked to the people who live on the street. Their stories are quite different from the impression given unintentionally by Life. They are not all mill workers, as Life infers. One owns a book store. One is a baker. Another operates the Academy poolroom. The owner of a restaurant lives there, too. One tenant is a truck driver. Some of them do work in the mills, but most important of all, and certainly overlooked entirely by Life, is the fact that 16 out of 19 of the houses were occupied by their owners, and those who work in the mills are regarded as being more fortunate than those who are in business for themselves. On this street, known as Avenue B, a typical product of Weirton, a young, attractive school teacher, had just returned from a 2½ months trip to Europe. A young mill worker, earning almost $9 a day during his first year out of high school, is the proud owner of a substantial bank account which would make most big-city white-collar workers very envious. The majority of the people who live on Avenue B reveal adequate and specific reasons for wanting to live there. Many of them lived there when this was the first street built up with homes back in 1909; and almost every one of the inhabitants could afford to live in a more imposing edifice if they so desired. Most of the people on this street are thrifty Greeks—there are only two houses occupied by colored families—and only two families on this street needed relief assistance during the worst days of 1932-33. One person here, when asked why he did not own a car, said: "Why should I have to put $5 in a gas tank every time I want to go anywhere. I'm smart; I save my money."

There was certainly not much to feel sorry about there. I asked him whether he wanted to join C. I. O. or was already a member. He said, "Why should I pay them loafers my money? I would first buy a car if I was going to spend. All they do is hang around the cigar stores."

A REAL FRIEND OF LABOR

The N. L. R. B. should call to the witness stand more of the men who actually work in the mill and fewer men who have not worked there for years. Perhaps they would accept the statement of a young man who graduated from Hiram College with an A. B. in 1931 and received another degree from Yale in 1934. He is a member of Theta Phi Kappa fraternity and was prominent in athletics, debate, and the glee club during his college career. He said, "I am on the side of labor. But I know what the workers are facing. My father and brother were forced to join the C. I. O. in Akron in order to hold their jobs and help keep the plant open and avoid violence and lost wages. As members now, they don't pay their dues until pressure is brought to bear upon them, but what choice do they have in the matter? In Weirton, I believe the company, as far as I can understand it, and as far as I can see and judge, are very much in sympathy with labor and the people in this town recognize that sympathy and feel that anything that would jeopardize that sympathy and consideration should be abhorred. I believe that the decisive element in the community, the C. I. O.-S. W. O. C. is now jeopardizing this relationship between employer and employee. I wouldn't want it in my church—and I can understand why workers do not want it in their plant." The man who made this statement is the highly esteemed pastor of a local church who knows the problems of the workers and the management and gave me his opinion of his own free will and accord and without any monetary or other consideration involved. It would be interesting if the N. L. R. B. would give a little more time to the study of the facts presented by educated people, college graduates, church members, and actual workers, instead of listening to so many loafers, atheists, Communists, ex-convicts, and liars.

SOCIAL DISTINCTION—NOT DOMINATION

I tried to get at the bottom of the facts concerning the great and excessive oppression cited by the N. L. R. B. by talking with men in the mill whom I found to my great surprise were graduates of West Virginia University, University of Pittsburgh, Carnegie Tech, Colgate, Western Reserve, Duquesne, Bethany, and Allegheny, among others. Many of these men who are finding their opportunity in the mill are boys who have known what it means to see their pictures published in the most prominent newspapers in the country. Many of them have more than one college degree—find that a job in the mill gives them not only better wages than they could find elsewhere, but enables them to study the evolution of new discoveries in metallurgy, chemistry, and engineering at first hand. They told me that a great change has occurred in the steel mills and that apparently Mr. Lewis and Mr. Roosevelt do not understand this.

Thirty years ago, in their opinion, the C. I. O. might have been a good thing because they think the workers themselves at that time could not have run their own union because of the difficulties of a general lack of education. Many of their fathers worked in the mill after having emigrated from Europe to Weirton. The men could not speak the English language—often could not read or write. They knew nothing about the principles of contracts and certainly were afraid to move around the country to find new jobs whenever they got into a dispute with their boss because they did not know where to go. Now they have no such problem. In the 30 years that have passed, these first-generation emigrants have become American citizens, and they are proud of their citizenship. They found that during 1909, Mr. E. T. Weir introduced the 8-hour day to steel to correspond to Henry Ford in the automobile industry. Except that Mr. Weir went much further than Mr. Ford. They say that there are no other plants which have kept up with the consistent and regular increases in the wages paid to workers in Weirton. They cite the fact that $39.284 is the average wage of all hourly, piece work, and tonnage employees combined—that this is paid for an average workweek of 42.7 hours. Therefore, they say, with plenty of remarks about wages of from $12 per day up to $40—that they think Mr. Weir has done the best job of anyone in the United States—not only by not taking advantage of the emigrant families which could neither read nor write—but also by constantly pushing wages up—constantly making more and better jobs—providing an insurance plan—helping the ignorant emigrants to learn to read and write and play baseball, football, basketball, sing, use orchestral instruments, play in the band, save money, build more and better homes, and use library and health facilities seldom equaled elsewhere.

The very things the N. L. R. B. complains about. They cite the experience of the recent depression during which Weirton citizens were not the ones who ran up a substantial share of the public debt burden due to relief requirements. Weirton employees say that while they did not receive their normal earnings in full during the pit of the slump, and often worked only 2 or 3 days per week, had more regular and high-paid employment than almost any other large group of industrial workers in the three nearby States. During the years of 1932 and 1933 Weirton workers went to grocery stores and bought groceries to take to their starving friends who were unemployed in the nearby coal mines—they were members of the United Mine Workers Union. Even today miners who earn, for example, $15 per week under United Mine Worker contracts, within a radius of 20 miles from Weirton, have to pay $4 per week in dues, powder, insurance, and assessments out of their small earnings before their earnings are given to them by their employer. That is because the mines operate on the closed-shop and the check-off system. The C. I. O. dues are taken out before the miners even have a chance to buy shoes or groceries. Perhaps, too, it is because the better workers—those who helped to educate themselves and their families—have become physically and mentally capable of working in steel mills, while some of the miners are still unable to speak the English language or to read or write after having been in America an equal length of time. As a result, when steel workers go to visit miners they often take their own food with them so that they will not deprive the miner's family of food. And so with these union mine workers so close by, all around them, in fact, it is not surprising that the Weirton men say that they want their own organization and not C. I. O. or any part of any idea advocated by John L. Lewis. They say, "When the miners begin to make half as much as we make we'll think about it but not before. Lewis is a miner, not a steel worker. We'll collect our own funds, handle our own money, run our own affairs, and if Mr. Lewis comes around this plant we'll kick him out of here so fast he won't know what happened to him."

NO SOCIAL DOMINATION

I asked the employees about social domination by the company. They thought I was crazy to suggest such a thing. They point out, for example, that in their opinion everyone who wants to own a car either has one or can afford to buy one. Most of the cars are new. They say that anyone who has a car can go anywhere and be socially dominated only by gas stations. This last summer Weirton employees either accepted the equivalent in extra pay for their vacations or else took their vacations in the following places, among others: H. J. Patterson, a trip to Detroit; Walter Hazel and wife, fishing in the Spanish River in northern Ontario; "Bud" Phebus and Pete Rosso, Oklahoma; Robert Winovich, Cumberland, Md.; Engineer Ivory, fishing 21 miles off the coast of Nova Scotia; Amy Rowland and Helen Rees, New England tour; Shannon Sage and Herb Huff, Virginia Beach, Va.; Ted Tolkweitz, Atlantic City, N. J.; John Wargo, Canada; Chester Sheftick, New York City; C. Shipley, a tour of Western States; Ann Cain, Minnesota; Stella Mieczkowska, Crystal Beach, Canada; Daisy Garbo, Geneva-on-the-Lake; Alice Struzik, Niagara Falls; Wilma Kunkle, Cedar Point, Ohio; Eddie Hughes, Washington, D. C.; Jack Winwood, Cape May, N. J.; Andrew Usmiani, a 3 months' trip to Europe; Dave Cassidy, Alaska; and here is the pay-off: One mill employee spent his vacation in London attending the coronation. These are not uncommon examples by any means. After mill workers finish telling you about 50 or 60 others—too rapidly for you to write their names down—and mention vacation resorts from Bar Harbor, Cape Cod, Nantucket, and Block Island, all the way across the Nation to the Grand Canyon and Hollywood—where some of the fine looking youngsters have tried to crash the movies—you realize that the charge of social domination is just another "brain trust" myth—a New Deal propagandists' pipe dream.

Some idea of the great oppressive activities of the company would undoubtedly be discovered if the N. L. R. B. tried to restrict the opportunities given by the company to the second generation of the emigrant families who have gained independence by working in the mills. Here every worker has the same opportunity for progress through enterprise that E. T. Weir, board chairman, and Tom Millsop, 38-year-old president, had when they worked in the mills. This opportunity for the second generation would be restricted if the N. L. R. B. succeeds in harnessing the entire plant in the horse collar of C. I. O. The older men in the plant want their children to have more—not less opportunities for advancement. Just as the second generation objects to the C. I. O. because they say that John L. Lewis has not apparently brought any social and economic freedom to the coal miners, the first generation objects to C. I. O. because they think that the Lewis plan would restrict the opportunities which exist for their children. Here in Weirton, the usual routine for a family is to raise from three to five children and to educate them by sending them all through high school and usually at least half of them through college or to a business or trade school. In high school the second generation kids have attended the same school attended by the children of the officers of the company, from Tom Millsop, president, on down. When they go away to college they often go to the same schools attended by the children of the company officers and stockholders and they say there is no feeling of social discrimination. Any reasonably careful study of what happens to Weirton kids when they go away to college shows that they have a better chance to be invited to join one of the better college fraternities or sororities than do youngsters from other less well-known communities. When the boys come back to the mills they wear the following fraternity emblems—among others: Chi Psi, Psi Upsilon, Delta Kappa Epsilon, Delta Upsilon, Delta Tau Delta, Kappa Alpha, Sigma Chi, Phi Delta Theta, Beta Theta Pi, Phi Kappa Psi, Sigma Alpha Epsilon, Phi Sigma Kappa, Zeta Psi, Chi Pi, or Sigma Nu. There is a reason for this. It is because the kind of life led by people who live in Weirton is a good life and creates a better and more wholesome kind of citizenship than is created in many other communities. When these kids go to college they have learned the unusual self-discipline and democracy which steel creates. They meet each other and their new friends as equals because within the lifetime of their family they have seen steel bring a higher standard of living and more of the good things of life to the entire Nation. Pole, Italian,

Greek, Slav, Scot, German, Russian, or Albanian in origin—they have the immediate background of the reality of social progress in industrial America and they suffer from no inferiority complexes or feelings of discrimination as a result. They go to colleges where they see that there is more opportunity back home in steel than there is on the farm or in the lumber camps or in mines, and as a result they come back to Weirton to take their part in making more and better steel.

Let us go over the names and experiences of typical workers whose records will not be known to the N. L. R. B. because they will not be called as Government witnesses. Almost two all-star football elevens could be placed in the field tomorrow out of Weirton workers from just among the men whom I checked during my visit. Paul "Bulldog" Reider, captain of University of Pittsburgh football team, who beat Army practically single-handed, graduated from Weirton High School and worked in the hot mill before he went to Pitt. His father was a roller—one of the men whose wages average from $15 to $28 a day.

Patsy Slate, captain and star from University of West Virginia, worked in the mill. Joe De Franko, now at Notre Dame, when at Weirton High School was all-State guard in 1935; worked in the mill and his family worked in the mill.

Mike Rodak, Western Reserve University triple-threat man, one of the most sensational football players in the State of Ohio; a 6-foot-3 giant who knows steel operations from stem to stern.

Tony Slate, captain of Bucknell University, and Clark Hinkle, recently one of the highest-scoring backfield players in the United States, both worked in the mill. Bob Smith, captain of Colgate and all-American selection of 1932, worked in strip-steel mill; graduated from Colgate in 1932 and from the University of Michigan in 1936; now practicing law in Steubenville, Ohio, and employed by Weirton Steel Co. as associate counsel; one of the outstanding football players of the last 25 years. Ken Sole, captain of football, Geneva College, about 1934; knows all operations in two sections of the plant.

Harry Smith, quarterback for Allegheny, played 3 years. Matthew Borek, now at George Washington University after 1 year in the plant. Andrew Mestrovik graduated from West Virginia University in 1936, played guard position, and worked every summer in the mill from the time he was 18 years of age; now working in the sheet mill. Jack Hamill, star of Bethany College in 1930, now in the employment office of Weirton.

Carl Hamill, fullback for Bethany College, a 12-letter man and now coach of Weirton High School. Member of Beta Theta Pi. John Bonaccaci, now at Duquesne in his second year. Worked in the sheet mill. Howard Gelini, graduate of Pitt in 1934 and on the Pitt squad. Now an inspector. Worked in strip and hot mills before he went to college. Member of Sigmi Chi fraternity. Played football 4 years and won three letters. Took an A. B. in industrial engineering at Pitt.

Harry Smith, who worked in the blooming mill of the steel works, went to Allegheny College and became a member of Sigma Alpha Epsilon fraternity. He weighed only 140 pounds, but played quarterback position and won three football letters, two basketball letters, and two baseball letters. He returned to Weirton after graduation from college and later was promoted to a position in the sales department, finally being promoted to the Chicago office of the company. Vincent Cooper and Carl Reardon, of Wittenberg College, at Springfield, Ohio, and Horace Hampton, of Akron University, are three more Weirton boys who made an enviable record on the gridiron.

"Puck" Burgwin made the Western Reserve football team in his sophomore year and was particularly distinguished for making an 80-yard run for a touchdown in the game against Case University. Formerly worked in the tin mill. Stanley Miltko, guard at Western Reserve, worked in the strip mill. Larry Stoops, assistant athletic director of West Virginia University, worked in Weirton mills.

These boys are typical of Weirton. Others, in the realm of baseball, have hung up amazing records. Mike Naymick, now pitcher for the Cleveland Indians, is 6 feet 8 inches in height, weighs 210, wears a size 15 shoe, and worked in the mills from the time he was 18 years old until he went to Springfield. John Zapor, of the national amateur championship Weirton baseball team of 1937, has had an offer to join the Detroit Tigers at a salary of $400 per, plus a $5,000 bonus. Almost every member of the 1937 championship team has had some offer in professional baseball, and those who have elected to stay at work in the plant are hanging up enviable earnings records in steel production.

Not all of the Weirton boys elect to excel in athletics however. Many choose scientific fields for concentrated work. A typical case of this type is that of the son of Joe Fabiamich. Joe came to this country at the age of 15 from Yugoslavia in the year 1905. He arrived at Weirton in 1913 and has worked here ever since. This year his son is in college at West Virginia University studying medicine. Joe is no more proud of his son however, than are the other fellows in the mill. They expect him to be at least as great a physician and surgeon as Dr. Nick Micheals, the nationally known superintendent of the City Hospital at Columbus, Ohio. Dr. Micheals was born and raised in Weirton and worked in the mills before obtaining his education. They expect the same of Emil Capito, 19-year-old son of Peter Capito, a roller in the tin mill. Emil is also studying medicine at West Virginia University. Harry Sykes, now working in the strip steel hot mill finishing, kills two birds with one stone. He works in the mill now and attends Bethany College, too, and is expected to graduate this year with magna cum laude honors. Everyone in the mill is proud of the enviable record of "home town boys who have made good." Weirton ex-mill hands, graduates of the so-called school of hard knocks, earned their initial capital in the steel mill which enabled them to start their own business. These loyal Weirton alumni, who have written hundreds of personal letters to their friends back home in the mills—are located from Maine to Mexico.

Thus both generations appear to have had advantages which even Uncle Sam with all his W. P. A. benevolence could not provide—and surely such advantages are anything but company domination. The company always has to compete against the economic and social oportunities which the combination of thrift and high wages provides for employees. But the employees understand a great deal more about the results of this evolutionary process of the production of individual independence. They know that out of every 50 boys born here in the second generation, there may be an occasional one who does not want to work and save and educate himself. Such men combined in this "loafers' legion" are described by Weirton workers as the "hot-shots." Their gangs are the inevitable riffraff—the industrial flotsam and jetsam—who do not want to succeed by following the road of hard work and self-improvement. They want "pay without work" and "power without principle." They are glad to oblige Mr. Golden of the C. I. O. by accepting his jobs of spreading discord and fomenting trouble. They are glad to get all they can out of the N. L. R. B. by sitting in the witness chair to answer the leading questions of the N. L. R. B.-C. I. O. attorneys—and they are too thick-skinned to feel embarassed when eventually they are often forced by Weirton counsel to admit that they have repeatedly lied. These compose the human residue of the process of successful evolution. They are not sufficient in number to be greatly concerned about. But they become a serious problem when Uncle Sam joins up with their gang and says, "Well, boys, let's give the 12,000 Weirton loyal workers the works."

But the Weirton workers are not deceived by Uncle Sam's strange alliance with pool sharks and snipe hunters. They say, "While the steel mill strikes this spring cost the other steel workers $9,000,000 in the other mills, we made two and one-half million in wages. The only ones who made any money under C. I. O. leadership during the strike were the C. I. O. leaders themselves. That is why we want no part of it. That is why we have our own independent loyal workers union."

THE CONTRAST OF C. I. O.

In contrast to the healthy picture of the real social and economic background of Weirton employees, typical of the best that American life has to offer, let us briefly look behind the scenes of the C. I. O.-N. L. R. B. plan of uplift and see what it proposes. One of the big men of C. I. O.-N. L. R. B., who most frequently cheers up the alleged down-trodden in Weirton for a consideration of a certain amount each month, is none other than our old Communist friend Clinton Golden, formerly business manager of the Brookwood Labor College at Katonah, N. Y. While in that position the college was repudiated by the American Federation of Labor as being a hotbed of Communist teaching, and Mr. Golden was severely rebuked. He admitted this on the witness stand during the Weirton hearing. Along with him is often seen Madam Rose Stein, the well-known New York agitator and Communist, a writer for the Daily Worker, the official organ of the Communist Party of America. These two have solicited and obtained the local cooperation of a young man named Kenny Koch, who is a local organizer of the C. I. O. Disregarding some personally very disagreeable things about Mr. Koch in the interest of editorial sweetness and light, we may point out that he too boasts that he is a product of the Communist Brookwood Labor College and has had a thorough course in instructions to organizers, how to conduct a strike, and other higher elements of educational routine unfortunately neglected at such reactionary places as Yale, Harvard, Princeton, Carnegie Tech, University of Pittsburgh, and elsewhere. Next in rank comes organizer Michael Jurich, the distinguished globetrotter who admitted on the witness stand that he was refused citizenship papers by the United States Government because he was a Communist. Then last of all we have the young fellow who was elected to office in the Weirton region on the New Deal ticket in the last election, Constable Steve Barron, who goes around wearing sidearms and ammunition belt while delivering N. L. R. B. subpenas at night and demanding C. I. O. memberships. These are the folks who lead the "hot shots" about whom the Government is so seriously concerned. These are the people who are causing all the furor, who are helping the N. L. R. B. to devise some scheme of forcing Weirton employees to drop their own independent union and join the C. I. O. Under the right Government dictatorship, the union ought to be able to collect at least half a million dollars a year in dues out of Weirton workers alone. Everyone in Weirton with whom I talked objected to this partisan C. I. O. sales promotional project of the N. L. R. B. There may have been some people who did not work in the mills and who cannot speak English and therefore whose opinions I could not have obtained who would be willing to trust their collective-bargaining fortunes to this collectivist brain trust, in return for the privilege of paying dues, but I could not find any who have a job in the mill now.

Here you have a colossal paradox—an act, the Wagner Act, designed to promote industrial peace, and it has, instead, fomented industrial discord. On the one hand you have a plant which has made big pay checks bloom. Where a whole community knew nothing of the real hardships of the last depression because the

company decided, instead of closing, to make more steel to provide the usual jobs for its employees, until the whole valley for a distance of 2 miles was loaded up to the roof tops with many, many times the normal stocks of steel, a total of more than 250,000 tons. Here you have workers who say that their earnings top the highest average of all American industries for all time. A company in which the highest officers worked in the mill and know every problem of a mill worker. A company whose president plays ragtime on the piano while the mill workers gather around and sing—believe it or not. You have employees who belong to their own independent union and who have negotiated more favorable terms for employees than the C. I. O. ever obtained under any contract they have signed up anywhere else.

A town in which 8 out of every 10 of the homes are owned, usually without mortgages, by the workers; a town where even the most modest workers have savings accounts and where the higher-priced workers, who make from $15 to $30 and up per day, say they can show bank books with deposits of from $5,000 to $25,000. A town where mill hands go out and pay $5,000 cash for a home and peel the bills from a roll they have hidden in an old sock in a trunk in the attic; a town in which the children of the president of the company sit side by side in school with the children of $5 per day laborers. A region noted for its production of nationally known athletes; a plant in which college-bred men prefer to take factory jobs rather than to take white-collar jobs elsewhere. A plant which is the alma mater for the managers and owners of some of the most successful enterprises in other communities from coast to coast, and some of the best lawyers, doctors, and teachers in America.

On the other hand you have the Government prosecuting a company on charges preferred almost entirely by men who are not employed by the plant and some who have not been employed since before the Wagner Act was passed, a prosecution based on charges preferred by men who never asked the management for the right to represent the workers in a collective-bargaining contract negotiation, by men who in total number are less than 1 percent of the total employment of Weirton.

You have witnesses who discredit themselves on the stand, only to have their statements made a part of the record by arbitrary rulings of the trial examiner, organizers who cheerfully admit their espousal of communism, a trial held at great expense and no end of annoyance to local business people and private citizens, and a tidal wave of loyal workers who are denied the right to testify to refute some of the statements which are admittedly lies which have been permitted to remain in the record of the trial. You have a town which has been overrun with Government investigators ever since 1933. You have a company which would have to reduce wages if the usual C. I. O. steel contract was signed.

My study of the situation convinces me, as it will convince any unprejudiced observer, that the record of 30 years in Weirton proves that the company has unquestionably created more and better jobs, provided increased wages and shorter hours in a form which furnished an example of leadership to industry, provided better homes and schools, encouraged those who wanted to build churches, created better and cheaper industrial products, provided better citizens and healthier families than otherwise would have been possible, have cheerfully accepted a legitimate plan of Wagner Act wage and hour negotiation prepared by their employees, and both company and workers regularly practice the plan. And in general both workers and management have done a good job of acting like self-respecting, ambitious American citizens who live according to the Golden Rule. And the company has apparently done a much better job of this here than Uncle Sam himself has apparently done in many Government departments.

The trial, in every particular, has proven to be a mockery of justice and a harbinger of dictatorship. It has invaded the constitutional rights of citizens and has devastated business conditions wherever its influence has extended. It has destroyed the confidence of Weirton employees in the possibility of obtaining a square deal from Uncle Sam in the handling of situations provoked by John L. Lewis and the publicity attending the trial is creating a spirit of depression which is best reflected on a broad scale in the repercussions of similar inquisitions elsewhere which parallel this case and which have been largely responsible for the recent decline in the values of stocks and bonds, the lowering of demand for commodities in many lines and the depression which is growing in the capital goods lines. The best antidote for this case is obvious. The N. L. R. B., if not soon abolished entirely, should be forced to establish fair rules of practice. It should be restrained from using the testimony of convicted criminals. It should be deprived of the use of information obtained by C. I. O. spies who have invaded the private rights of individuals and corporations. It should be subjected to the imposition of the same rules of evidence of common law and existing statutes which apply in all other courts if the Wagner Act remains in force at all. This case should be declared a mistrial and dropped.

[From the New York Herald Tribune of December 3, 1937]

N. L. R. B. Calls Editor To Task for Criticism—Labor Board Subpenas Publisher To Give All Data Used in Article on Weirton Steel Case—Assailed as Attack on a Free Press—Summons Is Called Void Because Board Lacks Right To Stifle Opinion

Washington, December 2.—The National Labor Relations Board has issued a dragnet "fail at your peril" subpena, it was disclosed today, requiring a trade magazine and its editor to make a complete revelation of all details of preparing, writing, and publishing an article frankly critical of the Labor Board's investigation of the Weirton Steel Co. The Board's move was described by counsel for the resisting publisher as unprecedented in the history of Federal agencies.

The magazine Mill and Factory, published by the Conover Mast Corporation, of New York City, contained an article in its October issue under the title "The True Story of Weirton." It was written by Hartley W. Barclay, editor of the magazine, which is devoted to the business of the steel and allied industries. A reprint of the article was widely distributed by the Weirton Co.

The subpena subsequently issued over the signature of J. Warren Madden, Chairman of the Labor Relations Board, requiring Mr. Barclay and the Conover Mast Corporation to appear before the trial examiner of the Board at Steubenville, Ohio, next Monday, was disclosed today when Mr. Barclay informed the Board he would not appear.

Elisha Hanson, counsel for the Conover Mast Corporation and Mr. Barclay, gave to the officers of the Board a letter declaring that the subpena was void and that the Board was seeking to violate the constitutional free-press rights possessed not only by his clients but by the American people as a whole. The Labor Relations Act gives the Board "no authority to stifle criticism," he said. "The action of the Board is without precedent in the whole span of this Nation's life." The kind of action it was attempting could be used to harass all critics into silence, he added.

"Those engaged in the business of the press are but trustees of the people's right to have a press free from official restraint," said Mr. Hanson's letter. "As trustee it is their duty to resist aggression against this right, from whatever source that aggression comes. Publishers and editors who are true to their trust must refuse to comply with any demand of any Government agency for them to lay bare not only the sources of their information but the record of their work, the inner workings of their minds, and the reasons controlling either their news or editorial policy."

MANY LISTED IN SUBPENA

The Labor Board apparently seeks to discover every contact between the magazine and the steel plant and town. The sweeping subpena, dated November 23, submits a dragnet listing of the names of people connected with the Weirton plant in requiring the production of any information exchanged between the magazine or its employees and the Weirton plant. In addition to individuals, the subpena schedule lists the Weirton Steel Co., the National Steel Corporation, "any employee of Weirton Steel Co.," and any member or officer of the Weirton Steel Employees' Representation Plan and the Employees' Security League.

The subpena requires production of letters, memoranda, telegrams, cablegrams, radiograms, reports, and other communications, and all written, printed, typewritten, and pictorial matter received by the Conover Mast Corporation directly or indirectly through its offices or employees, whether or not addressed to the corporation, from any individual, group, employees' association, or representative of the Weirton Steel Co. with relation to the article or the reprint.

All information pertaining to interviews or any other material used in the article are required to be produced. The magazine is directed to surrender "office copies of all letters, memoranda, telegrams, cables, radiograms, reports, and other communications" sent by the magazine to employees, officers, or other persons connected with the Weirton Steel Co. and its labor relations. "Records, memoranda, invoices, and bills relating to the sale or loan or gift" of copies of the October issue of Mill and Factory and the reprints are demanded. Proofs of the articles and corrections are also listed for production. In addition to records and transcripts, any "notations" of telephone communications between the magazine and any of the persons connected with the steel company are required. "Drafts, outlines, sketches, and layouts which may have been corrected or approved by anyone connected with the Weirton outfit are subpenaed.

DISCUSSES WEIRTON IN FULL

The magazine article about which this battle rages covers an account of the Labor Board hearings initiated on C. I. O. complaints against alleged antiunion discrimination at the Weirton plant. The article goes on to discuss income and social and labor relations at Weirton. It includes interviews with workers, excerpts from the testimony before the Board, and pictures of Weirton and its people. The article is written frankly from a conclusion that labor disputes were started by a minority of C. I. O. troublemakers and that the conduct of the N. L. R. B. hearings was prejudiced and entirely unfair.

The article begins: "The true story of Weirton or the best show of the year—go to Weirton. What comedy! What tragedy! What a colossal burlesque staged with taxpayers' money! What a curse to democracy! What a lot of expensive Wagner Act nonsense! What a silly waste of money! Of course, these are my own conclusions. But they are not based upon swivel-chair observations. They are based upon scores of personal interviews with all the individuals most concerned with and affected by the National Labor Relations Board trial of Weirton Steel Co. on charges of an unprecedented and all-embracing character. I saw and talked repeatedly at day and at night with all kinds of workers, in the mills, in their homes, on the streets, at a wrestling match, at their magnificent swimming pool, in the meeting of the men's choir, around the dingy courtroom, in which the trial is being held, and in my own room in the Fort Steuben Hotel, at Steubenville, Ohio. Their statements are important because it is reasonable to assume that what is going on here is typical of what is going on in a lot of places where similar hearings of the N. L. R. B. are being held.

Most of the workers expressed quite original opinions as to why they thought the trial was being conducted. One worker said: 'Kenny Koch, the C. I. O. organizer, told me that John Lewis can get the N. L. R. B. to crack down on any company that won't sign up with C. I. O.' Another worker said, 'The C. I. O. told me that President Roosevelt wants us to join them'"

UPHOLDS PUBLISHER'S RIGHT

Mr. Hanson, in his letter, pointed out that neither the Conover Mast Corporation nor Mr. Barclay was involved in any labor matter within the Board's jurisdiction. A publisher, he said, has perfect right to describe and criticize the activities of public officials without being haled before an official examiner.

Mr. Hanson referred to Supreme Court decisions in recent Minnesota and Louisiana cases where the attempts of State legislatures to curb an opposition press were halted.

"The subpena by its precise language demonstrates that the Board is convinced that the article on 'The True Story of Weirton' was prepared at the instance of or in collaboration with the respondents in the Board's proceeding," he said. "Even if this were true, which it is not, the Board has no power to summon before it any editor or publisher and command him to give testimony of the nature here sought. The Board is not a court which may punish for contempt. The Board is not immune to criticism. And the act under which it operates gives it no authority to stifle criticism in the manner here attempted.

"The action of the Board is without precedent in the whole span of this Nation's life. Yet it is a historical fact that similar action by the British Government 175 years ago not only precipitated the Revolution which gave birth to the American Nation but laid the cornerstone of the Bill of Rights in our Federal Constitution, the very sanctity of which is violated by this subpena."

The letter added: "If the power which the National Labor Relations Board now seeks to assert through the subpena directed to the Conover Mast Corporation and Mr. Barclay can be asserted, then there is nothing to prevent the Board from haling before one of its trial examiners any newspaper or magazine publisher, any editorial writer, correspondent, or commentator who writes or publishes anything critical of the Board's activities. If the National Labor Relations Board has such power, then myriad other agencies of Government have similar power.

"Such power of itself would constitute a direct restraint upon the press. It would enable any agency such as the National Labor Relations Board, smarting under discussion or criticism of its activities, so to harass those whose function it is to keep the public informed as to the acts, methods, and measures of public officials, as to restrict them in the performance of that function. the Board has no such power."

Federal Finances

EXTENSION OF REMARKS

OF

HON. ROYAL S. COPELAND

OF NEW YORK

IN THE SENATE OF THE UNITED STATES

Saturday, December 4 (legislative day of Tuesday, November 16), 1937

SPEECH OF THE HONORABLE DAVID I. WALSH, OF MASSACHUSETTS, AT THE MEETING OF THE MASSACHUSETTS REAL ESTATE EXCHANGE AT BELMONT, MASS., ON SEPTEMBER 14

Mr. COPELAND. Mr. President, I ask unanimous consent to have printed in the RECORD an address delivered by the senior Senator from Massachusetts [Mr. WALSH] on September 14, 1937, before the Massachusetts Real Estate League at Belmont, Mass., on the subject of Federal Finances.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

Everyone seeks to avoid consideration of the subject of debts and taxes. This is a natural state of mind. The mere statement of one's debts and one's tax burdens is not of itself necessarily objectionable—it is merely informative. The discomforting feature is that you cannot intelligently discuss debts and taxes without considering your income, and this may give you information that may be disquieting by indicating that you are on the way to bankruptcy unless drastic steps are taken to increase your income, reduce your expenditures, eliminate some of your luxuries—in fact, a new and rigid readjustment of all your fiscal affairs. The result is that the individual, rather than face the facts, delays, postpones action, and often develops a state of mind of indifference.

This state of mind in the commercial field determines the difference between efficient and inefficient management of business. It cannot exist long in business without ruinous results. In the field of Government the indifferent state of mind is conspicuous. It is much easier and more agreeable to spend than to curtail, to promote new governmental activities than to lessen those already in operation; to expand beneficial agencies than to reduce their number and usefulness.

The public generally believes that the government—Federal, State, or municipal—can undertake any fiscal obligation and somehow, and in some way, meet such obligations. Some cities have found out to their misfortune that this is not true. Some of our States have been made to realize this fallacy, as indeed have several foreign countries. Here in America because our national resources have been so extensive, our accumulation of national wealth so easy and rapid, the thought of inability to pay any Federal debt or fiscal obligation has been tabooed. Because of this public state of mind toward debt, expenditures, and taxes, such subjects are unpopular. Public officials avoid them. They prefer to be considered as givers and providers rather than alarmists. When occasionally an official attempts to restrict governmental luxuries by calling attention to what has been the result of debt accumulations—suffering, destitution, poverty, economic slavery—the public shrugs its shoulders as if to say "it cannot happen here."

All this is preliminary to calling attention to the importance and necessity of some group of our citizens becoming directly and intimately concerned about this subject of debts and taxes; of becoming interested to the extent of opposing waste and inefficiency in the administration of public funds, and the restriction of expenditures which may be beyond the fiscal strain of the Public Treasury. No group can do this better than the owners of real estate. No group ought to be more thoroughly and completely organized to perform this public service than the owners of real estate, small and large. Indeed, no group of our citizens has more at stake in the disastrous results of governmental debt accumulations and oppressive increases in taxes than real-estate owners.

Let me caution you against permitting yourselves to be arrayed in any move to eliminate the fundamental obligations of the local, State, or Federal governments to provide for the needy and to relieve destitution. Your cause will be prejudiced by any attitude other than that of recognizing the importance of all necessary governmental aid being extended to those who, through unemployment or other causes beyond their control, are in need of the necessities of life. You, as all citizens, should insist that even this primary obligation be met without waste, inefficiency, or favoritism. You will find other activities of government, where there may be prompt and drastic reductions, without beginning at this supreme governmental obligation.

Neither will it serve any useful purpose to criticize the debt that has already been accumulated. In times of emergency, extraordinary expenses must be incurred. If necessary, money must be borrowed. Such an emergency confronted us 4 years ago. Under the leadership of President Roosevelt that emergency was courageously and humanely met. The emergency has now largely passed. Now it is time to put our fiscal house in order.

Let me now present some facts about the biggest bill we all have to pay—our national debt. The Federal Government has just completed its sixth successive deficit year. The gross accumulated deficit during this year is $19,441,000,000. The increase in the debt during these 6 years is $17,593,000,000. The national debt, including contingent liabilities, is now $38,521,938,000, an increase of 138 percent in 6 years, representing a debt of $1,400 to every family in the United States.

How staggering these figures are can be gained from some comparisons. During the past 6 years the Federal Government has spent enough money to pay all the expenses of the Federal Government from its establishment to the last fiscal year before our entry into the World War, and in addition $11,750,000,000 more.

Deficits have continued in spite of the increased receipts which have occurred since 1933. The shortage first occurred in the year that ended on June 31, 1931. Less than half a billion dollars was the amount involved. It then started the ascent. In 7 years the red on the books stood to the extent of just under $20,000,000,000. These red-ink figures represent the amount paid out by our Government over and above the dollars received from taxes. They show how far the Federal Government has fallen short in making both ends meet.

Throughout the entire 6 years we have spent approximately $2 for every $1 collected in revenue. The ordinary receipts for 6 years totaled $18,000,000,000 plus, while gross expenditures totaled $37,000,000,000 plus.

At the same time the Federal expenditures have been rapidly increasing, State and local governments have kept up a high rate of spending. Consequently the total of all governmental expenditures has swelled to approximately $17,000,000,000 annually. This means that when the local and State government costs are added to expenditures of the National Government the average American must work 2 years out of every 8 to pay the cost of government. The aggregate public debt, totaling that of State and local governments as well as the Federal Government, has risen from $34,000,000,000 in 1930, the start of the 7 red years of government financing, to $56,000,000,000, a two-thirds increase. Today each person's share of the total public debt would be approximately $400. If borrowing were to cease and all the governmental outlays were to be met by tax collections, $1 out of every $4 of the annual national income would be taken by the tax collector. Notwithstanding the fact that the Federal revenues were higher this past fiscal year than ever before in peacetime, yet the gross Federal debt continues to rise.

The Federal Government is facing three almost equally difficult choices:

First. New taxes.

Second. Drastic expenditure cuts.

Third. Prepared to see the Budget for 1938 unbalanced not only as regard to debt retirement but any new spending as well.

As to new taxes: When the Government decides it needs more money it will turn to its one source of revenue, and that is your pocketbooks. I am not unmindful of the argument that these debts and expenditures can be met by a "soak the rich" program. This is one of the popular fallacies of the present day.

Any analysis of Federal income taxes leads to the conclusion that the shortage in revenues unfortunately must be met by levying taxes upon the low-income groups.

Nearly 61 percent of the entire annual net income of the country is reported by individuals with incomes of less than $5,000 a year. Only 7 percent of the taxable income is earned by individuals with incomes of more than $50,000 a year.

These figures plainly show that the Federal Government is going to be compelled to look to people with small incomes for a large part of the money that it will need to pay its deficits and reduce the debt in future years.

If the Government confiscated the entire income of those earning $1,000,000 a year, it would run the Government less than 1 week. If the Government confiscated the income of all those who earn $5,000, it would run the Government less than 7 months. Those that think that taxation is a problem only for the rich are very much mistaken. "Soaking the rich" will be necessary, but the low-income group will have to make up the deficit. In the last analysis taxation is a problem for everybody. Even when the Government levies high taxes upon the rich, the workers and those with low income must carry the burden.

How few people realize that when we talk about taxpayers no one is excepted. Our citizens pay more for taxes than they do for food or for rent, and twice as much as they spend for clothing. This is true whether one pays an income tax or not. The earnings of 3 full months of one's work year, or 25 cents out of every dollar one earns is what one pays to be governed.

There was a time when most of our revenues were gotten or raised by a direct income tax which people understood, as they could feel it. Today, our taxes are sugar-coated and hidden in various business transactions, leaving most of us unconscious of the assessment. Every proposal for an out-and-out sales tax as a revenue measure is strongly opposed as unfair to the masses, yet today we have such a tax on almost everything we buy, necessities as well as luxuries, the only difference being that it is a hidden tax and hardly one in a thousand realizes he has paid it.

Therefore the job of creating tax consciousness among the group of our people who are not real-estate owners, as well as those who are real-estate owners, is one of the greatest needs of the day. I am not attempting to criticize indirectly any particular phase of Government spending, nor do I wish to create an unnecessary alarm. I am trying to emphasize the fact that we must either curtail our spending or levy additional taxes, or both. I am trying to emphasize the fact that a prolonged evasion of this duty is a serious threat to our national security. I have no desire to criticize any particular spending project of our Government, for such criticism would be apart from the point at issue.

Bureaucratic costs make up a large part of the current difference between Government expenditures and Government revenues. The elimination of ineffective agencies, the consolidation of overlapping bureaus, and the ending of emergency expenditures which are no longer justified by the urgent necessity of the people will bring the balanced Budget within the reach of the Government. President Roosevelt recognizes these facts. The recent session of the Congress did likewise. The President's Committee on Administrative Management and the Senate special committee on the same subject have been at work for months on a far-reaching program of consolidating all Federal agencies.

Congress alone cannot do the job of reducing expenditures and removing inefficiency and waste. Indeed, it can do nothing without the vigorous support and leadership of the administration. The job-holding bureaucrats in the Government have placed many Members of Congress under obligations to them, and pressure from this source is always strong. The President is less subject to this pressure, hence he must lead the way, and if he does this, as I believe he will, with the courage with which he met the economic crisis that confronted him when he became President, he will have the undivided support of the American people and the approval of a substantial majority of both the House and the Senate.

No one can observe the present situation without reaching the conclusion that a real thrust for economy by the Government would be extremely popular with Members of Congress and public opinion in general. Such a move would be entirely in line with the advices given recently by the Chairman of the Federal Reserve Board, counseling on the best way to avoid damaging inflation. After all is said and done, the best way to approach the Budget-balancing objective is through the economy route.

The situation is not altogether discouraging. The recent Executive order of the President requesting a reduction of 10 percent expenditures in the executive departments and other assertions of intentions to cut expenditures indicates his recognition of the importance of this action. The Ways and Means Committee of the House and the Appropriation Committee of the Senate indicated in the late days of the session a determination to reduce expenses. Almost the last speech made in the Senate by the late Senator Robinson, leader of the administration forces in the Senate, constitutes a prophetic warning. I quote: "We cannot forever continue spending more than our income without impairing the Government's credit. It is about time, it seems to me, there should be cooperaton not only on the part of Federal agencies and Federal officers but on the part of others outside the sphere of National Government to bring about a condition which shall maintain the high standing of public credit which our Government has enjoyed, notwithstanding the fact that we increased the public debt by more than $18,000,000,000 during the last 7 years. Closing the gap which has so long existed between revenues and expenditures, and closing it as promptly as is possible, is not only essential and exceedingly desirable but it is almost imperative."

While the debts, expenditures, and revenues of the Federal Government are of concern to real-estate owners, yet the fiscal policies of local governments concern them more intimately. It is taxes upon real estate that local governments chiefly rely upon for their revenues. I need not tell you, who are members of the real-estate exchange, of the scope and extent to which real estate has been subjected in recent years to an ever-increasing tax burden. Unfortunately, too, there appears to be little immediate relief in sight.

The harmful effect of the increasing tax burdens upon real-estate owners must be stressed if relief is to come and home owning to be encouraged. The increase in real-estate taxes in many parts of the country has made home ownership on the part of those in the low-income class almost impossible. There is little incentive toward home ownership in view of the small return on money invested for those outside the salaried and comfortably well-to-do classes. It can be easily demonstrated that many of our working people who desire to establish a home for themselves and their family can rent property for the amount of taxes and other governmental assessments they would have to pay if they possessed their own real estate. Such persons cannot see any return on the money saved by investing in a home and, furthermore, they know that, except in unusual cases, heavier and increasing taxes limit the market for the sale of their property, which represents their sole savings, and may result in a considerable investment loss in the event the property has to be sold. In my opinion the decline in real-estate values and the slow recovery, since the beginning of the depression, in the upturn of real-estate values are due in large part to the ever-increasing tax rates.

We have thus far been speaking of direct taxes, and not indirect taxes, which are constantly increasing the cost of food and necessities of life and becoming a real problem for those of low incomes. What are we going to do about it? I recommend, first and foremost, vigilant and united action on the part of real-estate owners for the maintenance of efficient and honest local governments; a courageous protest against expenditures that are beyond the immediate needs of the people, especially those that enter into the field of extravagance; an insistence that the local budget be reduced and kept at a reasonable figure, one which will invite home ownership, encourage location of industries, and thereby promote and increase the value of home properties and give assurance to those who invest their money in real estate that they are not going to be assessed more and more year after year to pay tax burdens that are unnecessary. If wise, prudent, and practical administration of local affairs prevails, it can be done.

I realize all this is difficult in obtaining. I realize those who engage in such a fight will be charged with selfishness and sometimes even with a lack of public spirit. Such an effort, however, is quite the opposite. The cost in freedom, morale, and happiness is incalculable when the national credit of a nation collapses. President Roosevelt well said in his first message to the Congress: "Too often in recent history liberal governments have been wrecked on rocks of loose fiscal policy. We must avoid this danger."

Waste, extravagance, debts, and unreasonable taxes ultimately lead to rigid, strait-jacket economic administration by authorities outside of the local ones, or by the receivers of bankrupt courts, and thus liberal government and reasonable salaries to Government employees and all the other blessings of a local democracy disappear—temporarily, at least.

I have thus far made no reference to the fact that the Federal Government has been entering the real estate field through its housing activities. The consequences of such action, unless strictly limited and definitely restricted in scope, is bound to be harmful to every owner of real estate. I repeat, unless carefully guarded it will destroy private initiative in its field. Not only the individual who desires a home, but private capital will be frightened away from the housing field by the shadow of Federal Government competition, through grants and subsidies.

There is a limited field for the Federal Government in home-ownership activities. It is not in the field of building homes for those in comfortable circumstances. Unless we are committed to a policy of doing this for all our people, it ultimately means universal ownership of homes for our people by the Government, a form of socialism that no one heretofore has seriously proposed.

There is a field for Federal grants and subsidies that private capital does not touch. It is in the field of eliminating slums. Grants and subsidies that result in tearing down slums and providing homes for people with the very lowest incomes, who are obliged to live in slums because of their low incomes, can

be justified. Federal activities of this kind will help in militating a condition that cries for correction. Appropriations from the Federal or State Governments that will remove unsanitary, unsafe slumliness will be welcome everywhere. This can be done without large or extravagant expenditures and, indeed, as has been done in one instance at least, namely the District of Columbia, without ultimate financial loss to the Government, where slums have been taken over and put to uses that provide a reasonable income.

Furthermore, our local governments should evoke the same law as is on the statute books of New York. It permits local housing authorities to modernize and repair slum dwellings and put them into a habitable condition and thereby vest a lien in the public authority. It is a mistaken notion to think it is necessary for the Government to wipe out slum areas by purchasing. There is ample law that can be evoked permitting the abatement of a house nuisance which breeds disease, is unsafe and unhealthy, just as there is law to remove an open sewer or other nuisance on any individual's property.

As a consequence of these debts, deficits, and taxes to which I have referred, inflation is advancing, Government bonds are decreasing, and rates of interest rising. Prices on commodity purchases are increasing. The rising cost of living is stimulating labor agitation. Business that has been rising rapidly is at the moment hesitant and apprehensive. What will happen if another business recession comes along is being asked by more and more citizens as they observe the rapidity with which the national debt has mounted.

As the National Government is the ultimate custodian of credit for the entire country, it seems to me it is time, if we are to avert another economic crisis, that action should not longer be delayed. The first step to restore confidence is to balance the Federal Budget. We must make a choice in order to do this between large deficits and increased taxes or economy. There is no alternative.

The Farmer's Place in the Solving of World Economic Problems

EXTENSION OF REMARKS

OF

HON. ELBERT D. THOMAS

OF UTAH

IN THE SENATE OF THE UNITED STATES

Saturday, December 4 (legislative day of Tuesday, November 16), 1937

RADIO ADDRESS BY HON. JAMES P. POPE, OF IDAHO, NOVEMBER 28, 1937

Mr. THOMAS of Utah. Mr. President, I ask unanimous consent to have inserted in the Appendix of the RECORD an address delivered on Sunday, November 28, at 2 p. m., over the Columbia Broadcasting System, by the junior Senator from Idaho [Mr. POPE], on the subject the Farmer's Place in the Solving of World Economic Problems.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

Last week a United Press correspondent in China sent the following cable in his news reports: "Scenes of horror mark the retreat of the Chinese * * * screaming and running like maniacs were soldiers whose skin had been burned from their hands and faces, splashed by a sulphur bomb. Speeding military trucks added to the confusion, running down soldiers and refugees who did not step aside in time."

A Chinese general summed up the situation with the remark "Things are upside down."

On the other side of the world things are likewise upside down. One group of Spaniards is engaged in the destruction of another, and between them they are destroying generations of productive human effort.

The ironical thing about it all is that men are killing other men, destroying property, demolishing institutions of culture and objects of art which can never be replaced, without knowing what it is all about. All they know is that leaders in whom they have confidence have promised them prosperity and a more abundant life if they are successful in destroying their neighbors.

The dictatorial governments of the world have for the past generation manipulated their policies, their economic forces, and their peoples like giant chessmen in a game where checkmate means war. When that point is reached, it is too late to undo, in a day, forces and economic pressures which have been built up over a quarter of a century. If we are to be fair and sensible in our consideration of the problems of the world, we must take a lesson from this experience and avoid disastrous moves in the next game.

The warlike attitude of Italy is as much the cause of Mussolini as the result. Preparation for war in Germany on a large scale could not be brought about solely by Hitler and the war in China can be blamed no more on Japanese militarists than on the forces which put militarists in power in Japan.

In the United States we use a process of approaching a problem which, if properly applied, would be of tremendous value in solving the problems of a restive world. When the Department of Agriculture needs to deal with a sudden flood in the flow of agricultural commodities to market, it seeks the remedy at the source of the stream—agricultural production. When our Government has sought to control floods on the great Mississippi and other rivers, it has gone to the source of the waters which constitute the flood and has constructed check dams, improved the watershed, rather than rely upon levees and embankments at the point where floodwaters rage. We are gradually learning that our top-heavy financial structure can best be balanced by remedying the condition of those with whom all business originates—the wage earner, and the farmer, and other producers of wealth.

By analogy, statesmen must, if they would be successful, deal with international complications at their source—the economic condition of the peoples of the earth. Who has not heard it said that Japan would not resort to war but for overpopulation and the need for foreign markets? Never a day passes but that someone argues that Germany and Italy are threatening war to improve the economic welfare of their own people. It is easy enough to prove that war never improves the condition of a people, but such proof is rather barren and academic so long as nations have governments which send them to war on that pretext.

Whether they are the intrinsic causes of war or the excuses on which a war spirit is built, the troubles of the modern world find their origin in trade restrictions, tariff walls, embargoes, and other economic discriminations. Such barriers tend to confine the exportable surpluses of all commodities, and, when confined, nothing can cause more trouble internally or internationally than an unusable, unsalable supply of exportable goods.

Japan and Germany, for the most part, have been manufacturing nations. The United States originally was an agricultural nation. We did not manufacture goods for the world markets to the extent that Japan or Germany were compelled to do. Nonetheless, we have erected barriers in the form of high tariffs against foreign imports of manufactured goods. Foreign nations, finding themselves with a resulting surplus of manufactured commodities retaliated by restricting imports of American agricultural commodities. The result has been depression for the American farmer. As a result we have had comparatively mild internal strife. In smaller nations that strife has grown until revolution placed dictatorial nationalist governments in power, and they now threaten the peace of the world.

In view of this situation, I commend the establishment of this world economic cooperative program; and I hope that our people will devote their thoughts to providing for the future by adopting measures of economic cooperation among themselves and with other nations. If all nations could cooperate like the United States and Canada, the international problem would be well-nigh solved.

The United States is so large and its climate so varied that we do not feel the vicissitudes of foreign trade as keenly as other small, less diversified nations. We are capable, therefore, of withstanding shocks in international trade much more effectively than other nations. Nevertheless the international trade problem is with us, and upon our handling of it largely depends our future relations with the nations of the world.

In 1937 the Nation is harvesting a wheat crop of about 887,000,000 bushels. The average domestic consumption of wheat is about 668,000,000 bushels. It is likely that there will be a carry-over of about 200,000,000 bushels of wheat on July 1, 1938. If there is a favorable season in 1938, with a probable 80,000,000 acres planted to wheat, we will find ourselves with an unexportable carry-over of between 400,000,000 and 500,000,000 bushels of wheat in 1939. There are many, many nations which could use that wheat to good advantage and exchange for it products needed in the United States, but that possibility has been precluded by an unsurmountable barrier of tariffs and trade restrictions erected years ago at the behest of a self-seeking, industrial minority.

In 1937 there is being harvested a crop of more than 2,500,000,000 bushels of corn which will result in a carry-over of about 325,000,000 bushels. The 1937 corn production is sufficient to produce an excess of livestock products so far as domestic needs are concerned. That surplus, too, might well be exported and help to cement friendly relations between the United States and other nations, but trade restrictions, still existing as a result of the Smoot-Hawley tariff bill, stand in the way.

This year we are growing about 18,500,000 bales of cotton. The world's supply of cotton promises to be more than 49,000,000 bales and the world never uses in any one year more than 31,000,000 bales. Domestic consumption of cotton has reached an all-time high record of 8,000,000 bales and yet the enormous surplus which we are unable to sell promises to ruin the cotton growers. Our export market in cotton is declining simply because other nations have commenced growing cotton. They are growing

it because of high tariffs and other restrictions on their products which they customarily exchange for cotton.

The net result of these facts is that the United States is left with a surplus on the domestic market. It ruins farmers' prices. It causes political strife and results in a general economic maladjustment. But that is not all. The gradual reduction of our trade with foreign nations not only has destroyed the market for our cotton and our wheat, but it has destroyed the market here for things which other countries are peculiarly adapted to produce. As I have pointed out, in smaller nations where economic pressures are more severe, sentiment is gradually shaped to favor wars of aggression, to break down by bloodshed and strife, tariff walls which never should have been erected.

Until a few years ago every session of Congress was besieged by various interests to put a prohibitive tariff on some product. They contended that as an American industry they were entitled to protection. They were given protection. Eventually, protection resulted in, first, higher prices to American consumers; second, the destruction of an export market for other nations; and, third, the consequent destruction of export markets of this Nation. It is conceivable that a group of lobbyists will be in Washington before long, urging a high tariff on bananas and rubber trees, because they can be grown in hothouses at home. When they are grown in hothouses, bananas will cost $10 a dozen, and automobiles will run on the rims. Another portion of the export market for our minerals, agricultural commodities, or manufactured articles will be destroyed, and some southern country will be establishing a dictatorship to fight for a new foreign market.

The importance of foreign trade cannot be overemphasized. There is no practicable way for this Nation to reduce the total acreage of crops to a point where we would produce only that which is needed for domestic consumption. In other words, there is no immediate prospect of getting the American farmer out of the world market, and the main question is whether he shall be forced to deal on a cutthroat basis and to destroy lives and property in acquiring markets to which he is justly entitled, or whether he can deal with his neighbors in a civilized, cooperative way and maintain a prosperous and peaceful relationship with them.

Nothing can be more inconsistent with principles of civilized society. Nothing can show greater lack of intelligence than building up artificial barriers and then going to war to tear them down. The war always costs more than the market is worth after it is acquired and the market could be acquired better by peaceful methods anyway.

On the Pacific coast, in the three great States of Idaho, Oregon, and Washington, this problem is particularly acute. This year those three States are producing more than 80,000,000 bushels of wheat. The local estimated consumption for food, feed, seed, and shipments to other States totals about 59,000,000 bushels, leaving available for export and carry-over approximately 35,000,000 bushels of wheat. Our exports at the present time from that area will not begin to take care of it and every agricultural expert in the country knows that an outlet must be devised for Pacific Northwest wheat or each year the carry-over will become excessively large and prices correspondingly low.

That would mean bankruptcy for many farmers in that region. Yet, we know that if Japan and other Asiatic nations would approach the matter on a businesslike cooperative basis and provide sensible remedies there would be plenty of wheat in Asia and if the program were extended to other raw materials, there would be no need for war. Furthermore, the price of the wheat and other raw materials which we and other nations could supply to the Far East would be but a small fraction of the cost of war.

During the last few years the United States Government has provided an object lesson in a method of developing foreign trade. We have concluded trade agreements with 14 foreign countries. The preponderant tendency in these agreements was for the United States to lower tariffs on manufactured products and for the foreign nations to lower tariffs on our agricultural products. The exports from the United States to the 14 trade-agreement countries have increased 44.5 percent in 1937 over 1936. Our exports to all other countries have increased only 33 percent. Our imports, on the other hand, from the 14 trade-agreement countries have increased 27.4 percent this year over last year; and our imports from the non-trade-agreement countries have increased 44.4 percent. The beneficial effect of such a trade growth cannot be questioned and it appears that the nations with whom we deal are likewise being benefited.

In 1936 the Secretary of State, the Honorable Cordell Hull, said: "Prosperity and peace are not separate entities. To promote one is to promote the other. The economic well-being of peoples is the greatest single protection against civil strife, large armaments, war. A people employed and in a state of reasonable comfort is not a people among whom class struggles, dictatorships, and war can thrive. But a people driven to desperation by want and misery is at all times a threat to peace, an invitation to disorder and chaos, both internal and external."

To recognize this truth is to see in clear perspective the cause of war. To realize this fundamental cause of strife is to begin a solution. If the United States of America with her tremendous economic influence and prestige will continue upon a program of international economic cooperation, the world will soon begin to follow suit. Then, and then only, can we make real progress toward a lasting peace and prosperity among the nations.

Government Control of Agricultural Production

EXTENSION OF REMARKS

OF

HON. JOHN H. BANKHEAD, 2D

OF ALABAMA

IN THE SENATE OF THE UNITED STATES

Saturday, December 4 (legislative day of Tuesday, November 16), 1937

ADDRESS BY EDWARD A. O'NEAL, PRESIDENT, AMERICAN FARM BUREAU FEDERATION, ON THE TOWN HALL PROGRAM, THURSDAY, DECEMBER 2, 1937

Mr. BANKHEAD. Mr. President, I ask unanimous consent to have printed in the RECORD an interesting radio address delivered on the Town Hall program by Edward A. O'Neal, president of the American Farm Bureau Federation, supporting the affirmative of the question, Should there be Government control of agricultural production?

There being no objection, the address was ordered to be printed in the RECORD, as follows:

"Should there be Government control of agricultural production?" I support the affirmative of this proposition because I believe that through adjustment of production farm income may be stabilized at a prosperous level; and I believe further that this country will never enjoy steady continuous prosperity for any considerable length of time until this is done.

This country can attain the greatest measure of economic well being only when a fair economic balance exists between the different population groups. Nobody can successfully dispute that. We can't have successful mass production of industrial goods unless our economic system permits wide distribution of purchasing power among the people. We are prosperous when the different groups are exchanging goods and services in large volume.

This Nation is enormously rich in natural resources, in scientific attainments, in the productive enterprise of its people. We have the facilities to provde in abundance for every human need. And yet we are subjected to recurring periods of business depression. We find poverty in the midst of plenty. We cannot maintain a political democracy in a country where we have economic autocracy. Every nation has discovered that.

Since farmers produce the bulk of the new wealth, and since they are the biggest buyers of industrial goods, it follows that the welfare of the farm group is the key factor in maintaining prosperity for the entire country. Factory pay rolls rise and fall with the rise and fall of farm income. If the farmer cannot buy in normal volume, labor cannot be employed in normal volume.

The farmer has been at a disadvantage as compared with other groups nearly all the time since the Great War. During all of that time, except for short periods, farm commodity prices were so badly out of line with other prices that the farmer could not buy the industrial goods that he needed and wanted.

Prices were held down chiefly because of great surpluses. We had surpluses because we had lost the bulk of our foreign markets. Farmers were cultivating some 35,000,000 acres of land more than was necessary to supply the domestic market. Surpluses accumulated and prices fell to unprofitable levels. Faced with such a condition, farmers have only two possible alternatives. They may find new domestic uses for farm products, or they may retire some land from cultivation, just as the manufacturer closes part of his factory when demand falls off. There are possibilities in developing new uses for farm products, but they can be developed only through long years of painstaking research. The present emergency cannot be met in this way.

It seems obvious, then, that if we continue to cultivate our usual number of crop acres, it will be many years before increases in population will permit the domestic market to absorb all of our production.

Manufacturers of automobiles produce only as many cars as the market will absorb at a price. Everybody would think they were crazy if they deliberately produced more than they could sell. And yet many industrial leaders have condemned production control for farmers as unsound, and even immoral.

Farmers have tried production control in their business, under the provisions of the Agricultural Adjustment Act of 1933, and they found it good. Large majorities approved the control programs whenever a referendum vote was taken. Some of the commodity groups voted almost unanimously for the program.

Those control programs were wiped out by the Supreme Court. Now great numbers of farmers, including the group that has honored me with the responsibilities of leadership, are demanding another law that will permit them again to adjust production to effective market demands, so that farm prices may be stabilized.

I maintain that, as a matter of equity and justice, the Federal Government should do this, because it has already granted equivalent benefits to almost any other group of our population that you can name.

The heart of our national policy for industry is the protective tariff, a device to raise prices by artificial means. The favorite argument of the proponents of the tariff theory is that it protects the manufacturer against cheaper goods of foreign manufacture, and it protects the American laborer in his standard of living. They say that if tariffs were wiped out, American manufacturers would have to reduce prices and consequently the wages of labor, which in turn would lead to reduced consumption of goods, unemployment, bankruptcy, and chaos.

So runs the argument. I am neither attacking nor defending the theory—I simply call your attention to it. The indisputable fact is that tariffs raise prices and the public pays the bill. Tariffs are imposed by the Federal Government, therefore the Federal Government is at least partially responsible for the high prices that farmers must pay for industrial goods. Tariffs work against the farmer on export crops. Wheat actually sold in 1932 for less than the amount of the tariff of 42 cents a bushel.

Now let us consider the field of monopoly. The Federal Government has held that some phases of industry constitute natural monopolies, and that the public is best served when competition in these fields is eliminated or at least regulated by law. Rates are presumably established to provide for all necessary costs and to provide profits for the operator. If you want to ship wheat to market by rail, use a telephone, use electricity or gas in your home, you must pay a fixed rate or you won't get any service.

Let us consider retail prices of manufactured goods. The corporate form of organization, and the concentration of industry in huge units has given manufacturers a large measure of control over prices. Now they are to have, by law, much greater control, under the Miller-Tydings Act, a law for retail-price maintenance. That law provides that the manufacturer of any standard article can establish the minimum price at which retailers can sell the article to the public in some 40 States which have adopted so-called fair-trade laws.

Price fixing by government is bad enough; but here is something far more sinister in its implications, for it enables individuals and corporations to, in effect, absolutely dictate the prices which the public must pay for many articles of commerce. With the Government fixing prices, we could at least hope that prices would be fixed in the public interest; but with manufacturers fixing prices, nobody doubts that prices will be fixed primarily in the interest of the manufacturer.

Lastly, let us consider the fixing of wages. In the old days, if a farmer wished to build a barn, he hired a carpenter in the nearby village. Wage rates were the result, roughly, of free competition. If carpenters were scarce and prices were high wages were likely to be high. If times were hard and carpenters eager for work, with living costs low, farmers could hire carpenters at rates that he could afford to pay, considering the low price that his commodities were fetching in the market. If you build a barn today you must pay the carpenters according to an arbitrary wage scale. When the farmer buys a tractor, or a car, or a radio, or an electric-light bulb, he must pay prices that reflect fixed costs for the labor that produced the goods.

I am not attacking labor; I am simply pointing out truths that anybody can verify and for which I blame nobody. Farmers want labor to get its fair share of the national income. What I am saying is that the farmer, when he buys goods and services, must pay prices that are more and more fixed in arbitrary fashion, while he sells his commodities at prices that are allowed to fluctuate in response to natural economic forces. You may say that high wage scales have been achieved by labor through organization, not through legislation. But remember that the principle of collective bargaining by labor has been recognized by the Federal Government in the Wagner Labor Relations Act. Bear in mind, too, that the wage and hour bill which has already been passed by the Senate and will soon be considered by the House proposes to fix very definitely minimum wages for the entire country.

Now, if all groups except the farmers are favored with such advantages and the farmer is denied equivalent helps in maintaining his own commodity prices, it is evident that farmers cannot trade on fair terms with other groups except as fortuitous circumstances happen to raise his prices to levels in line with his fixed costs. That will have serious consequences to the Nation as a whole, because when farmers can't buy goods labor cannot be fully employed.

Some of you will doubtless contend that all laws that lead to freezing of prices and wage scales at arbitrary levels are wrong in principle and that farmers should not ask for legislation to insure parity prices simply because other groups have secured unwarranted advantages from the Government. Two wrongs do not make a right, you say. All right. Erase from the statute books all tariff laws, all monopoly grants, all labor legislation, all price-maintaining laws, and any other legislation which introduces any artificial factor to interfere with free and open competition. The farmer will not complain. He will be well able to take care of himself if free and open competition is allowed to prevail. But if we continue all these artificial aids to other groups as a matter of national policy, then by every consideration of fairness the farmer is entitled to equivalent protection. How else, I ask you, can fair balance be maintained between groups?

All of you have heard and read of an alleged "philosophy of scarcity" which farmers have been said to endorse. The farmer does not believe in such philosophy, and he has never favored legislation based on such philosophy. He believes in abundance and fair prices, but he does not believe in a philosophy of wastefulness. He does not believe in producing for a market that no longer exists. Some have attributed the present scarcity of beef to a production-control program. The fact is that there is no production-control program for beef cattle in this country, and there never has been one. Present scarcity is the result of the drought of 1934, the worst in our entire history, which destroyed the range herds of thousands of ranchers, followed by another drought in 1936.

Many have said that if farmers would produce more the people would eat more; that if you get prices low enough there would be no surplus. The record does not bear out this theory. Breadlines have been longest when crop surpluses were greatest and prices lowest.

Because of lack of time I have not discussed the fact that adverse economic conditions have forced farmers to follow a destructive policy with regard to the soil, which is our greatest natural resource. I speak as a southern cotton farmer. I contribute raw material for one of the country's great industries which has made countless people rich and which has contributed enormously to increasing the national wealth. Yet as a producer of the raw material I am penalized because our national policy decrees that the manufacturer of cotton shall be protected against foreign competition, but the grower of cotton must compete with peasant labor in competing countries. The result is that we have gutted our soils. What responsibility does the Government hold for a condition that must be corrected?

Caught between world prices for the commodities he sells and American prices for things he buys, the farmer is indeed in a vicious lock which becomes tighter and tighter as other groups obtain increasing legislation to give them artificial advantages, and as our entire national economy becomes more complex.

What does the farmer ask for? He is willing and anxious to provide commodities in abundance to meet all domestic and foreign demand; and in return for this he is asking for his fair share of the national income. The American Farm Bureau Federation today is fighting for the enactment of the Pope-McGill bill at Washington. That bill provides not only for sufficient production to meet current demands, but also for reserve supplies against the time of disaster. It provides a mechanism to protect market prices against the depressing price of large surpluses, but it guards against prices rising to unduly high levels. It is designed to give the farmer a fair measure of stability and security in his business. Its great objective is a parity price for farm commodities, which is a price that will enable the farmer to trade on even terms with other groups. I earnestly hope that consumers will study this legislation, because I believe that by stabilizing agriculture, our basic industry, it will do as much or more for other groups as for farmers. I say this because agriculture is the broad base of our entire economic structure. If you stabilize the buying power of farmers you will do more to stabilize industry and business and maintain employment than you can accomplish by any other means.

Stabilized Farming

EXTENSION OF REMARKS

OF

HON. GEORGE McGILL

OF KANSAS

IN THE SENATE OF THE UNITED STATES

Saturday, December 4 (legislative day of Tuesday, November 16), 1937

RADIO ADDRESS OF HON. JAMES P. POPE, OF IDAHO, DECEMBER 3, 1937

Mr. McGILL. Mr. President, yesterday afternoon the junior Senator from Idaho [Mr. POPE] delivered over the Columbia Broadcasting System a radio address upon the subject Stabilized Farming. It is a very interesting address, and I ask that it be printed in the Appendix of the RECORD.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

"Steel production last week estimated 32 percent of capacity." This is a headline in the Wall Street Journal for December 2. On November 30 the same paper carried this headline: "Newsprint output to be cut again after January 1." These news reports

would indicate that something is wrong with the steel and newsprint industries, and yet the price of steel, at the present time, is several dollars per hundred pounds higher than the 1930–36 average. A great many newspaper editors have told me that the price of newsprint is higher than they can afford.

Compare this with similar news stories affecting the agricultural industry. On December 2 the New York Journal of Commerce carried two headlines. The first was: "Knitters curtail output of cloth." The second was: "Raw wool prices decrease further as demand continues stagnant."

Those who are interested in the welfare of American agriculture frequently wonder why it is that the price of steel, farm machinery, and many other commodities which farmers buy continue on a high level. At the same time the price of the things the farmer sells drops when agriculture has a good year. The demand for steel this year apparently is low. Production is 32 percent of capacity, yet prices are as high as they were when the demand for steel was at its peak. Early this year the average farm price for wheat exceeded a dollar. Farmers throughout the Nation had an excellent year producing abundant crops. As soon as those crops were harvested, wheat fell to an average price of 80 cents a bushel and other agricultural commodities have experienced similar price declines. The potatoes, for which the State of Idaho is famous, were produced in abundance this year and the growers are receiving about 40 cents per hundredweight.

It is obvious, at a glance, that there is some radically unfair disparity between the practices of industry and agriculture.

It seems wise, therefore, to examine the essential practices of American industry. An automobile manufacturer knows at the beginning of each year about how many cars he can sell. He knows how many other automobiles are manufactured and he knows how to regulate his production so that it will be absorbed by the market. If orders from automobile dealers do not keep abreast of production, production is immediately curtailed.

Consider, on the other hand, the methods used by American agriculture. In the spring a farmer plants his crops. He has no way of knowing how many other farmers are planting the same crop nor how much of it they are sowing. At best, he can plant his farm and trust to luck that an enormous surplus of his commodity will not be produced to ruin prices and force him into bankruptcy. I have known a great many farmers in the State of Idaho and the methods they use in selecting the crops to produce. Those whose farms are capable of diversification endeavor to select crops of which a surplus is not likely to be produced. Those farmers are simply guessing in competition with 7,000,000 other farmers. Occasionally one of them guesses right. He produces a large crop and receives a fair price. On those occasions he makes some money, but such times are few and far between.

For the most part, the farmer spends the entire growing season at hard labor, producing his commodity; and when harvest time comes he finds the market already overstocked with the goods he has to sell. He is hard pressed for cash to pay his debts and sells his commodity below cost of production. It is in this way that a tremendous number of American farmers have gradually gone deeper and deeper into the morass of debt until foreclosure takes them from the soil and places them in bread lines and on relief rolls.

Thirty-one million American people are directly or indirectly dependent upon agriculture for their livelihoods. It is more than a question of helping the farmer, stabilizing the occupation of farming; it is the first link in the chain of America's economic and political stability.

As a result of recognizing the basis of the agricultural problem and endeavoring to cure the defects at their source, the farm program now pending before the Senate was evolved. The basic principle of the pending farm bill is the coordination of production with demand. The program has become known by the widely publicized phrases, "production control" and "the ever-normal granary."

When the program was proposed, many of the professional critics of any legislative program raised their voices in protest against any effort to control agricultural production. The argument, or at least the sophistry most widely used, is that the Government should not attempt to deal with agricultural production. Other industries, they say, are free to produce as they will, but nothing could be farther from the truth. Agriculture is the only industry in America today which does not have adjusted production. The Government has nothing to do with it, it is true, but the organizations which manufacture and market everything from a locomotive to a can opener, or a pair of shoes, control production, absolutely, on the basis of probable demand. Virtually every industry is organized on a large scale. A handful of men, at most, can bring to an abrupt halt the production of automobiles or farm machinery, should the demand decline.

It is easy enough for the leaders of great industries to use their own initiative and regulate their own production, but what about the farmer? Is there anyone who will say that 7,000,000 farmers can get together unaided to apply business methods to farming? Time after time groups of farmers in my State have tried to make voluntary agreements to reduce production of surplus commodities. Ninety percent will keep the agreement but an individual here and there invariably increases his production to such an extent that the efforts of the group to get better market prices are frustrated.

Suppose, for a moment, there are 7,000,000 manufacturers of automobiles in the United States totally independent of each other. They would manufacture so many automobiles that one could be purchased for a song, until they all went broke. If there were 7,000,000 independent, competing railroads and transportation companies, a vacationing clerk could probably go round the world for a nickel.

There are people who blind themselves to these obvious facts and continue to shout for rugged individualism in the industry of agriculture. Every high-school student who studies economics soon learns that no amount of rugged individualism can obstruct the operation of the law of supply and demand. If there are 2 bushels of wheat where only one can be consumed, the price will fall below the cost of production as surely as the law of gravity will force thrown stones to earth again.

In the United States we consume about 650,000,000 bushels of wheat each year and export less than 50,000,000 bushels. This year the Nation is harvesting a crop of about 887,000,000 bushels. On July 1, 1938, the United States will have a carry-over of about 200,000,000 bushels of wheat. Without legislation farmers are expected to plant 80,000,000 acres to wheat next year, and with a favorable season there will be a crop of nearly 1,000,000,000 bushels. Thus we can anticipate, if nothing is done, a surplus of wheat near 500,000,000 bushels next year. This would be as large as the wheat surplus which existed in 1932. That surplus largely contributed to placing prices at the lowest point since the reign of Queen Elizabeth. In those unfortunate times farmers had no incomes. They stopped buying from department stores and automobile dealers. Eventually, their loss was reflected in the big industries and all business went on the rocks.

A similar situation exists with respect to other major commodities. A carry-over of about 325,000,000 bushels of corn is estimated. That is more than double the normal carry-over. The 1937 cotton crop is over 18,500,000 bales, and the highest annual domestic consumption of cotton the United States has ever seen is 8,000,000 bales. Is there anyone who thinks that a surplus of 11,000,000 bales of cotton will not depress the price to the farmer? Those who buy cotton will simply offer a continuously lower price and growers will be forced to accept low prices to avoid destitution and want.

These are the reasons why the new farm program seeks generally to permit agriculture to regulate production to meet probable demand. The regulation does not, by any means, compare with the precise measurements of regulated industrial production. The ever-normal-granary provisions of the pending farm bill would at all times maintain a surplus of about 100,000,000 bushels as a protection against drought or other emergency.

The so-called production control, incidentally, is entirely voluntary as to corn and wheat. Those who are antagonistic to agricultural relief talk of regimenting the farmer and controlling his activities, but, as a matter of fact, under the pending farm bill the farmers are simply given an opportunity to sign a contract by which they would reduce production to a point where a reasonable relationship with market demands is maintained. In return for signing and complying with such contracts, the farmer gets a guaranty from the Government of a reasonably fair income. The purpose of the bill is to bring up farm prices, as nearly as possible, to parity. Parity means $1.17 per bushel for wheat and 85 cents for corn. At that rate a farmer has an opportunity, by good management, to make a decent living and the interests of the consumers are fully protected.

The treatment accorded to the producers of other basic commodities—cotton, corn, tobacco, and rice—is similar, and if production is limited to a reasonable extent the cost to the Government will be slight.

Another provision of the bill which is of tremendous importance to every farmer is the establishment of the Surplus Reserve Loan Corporation to grant loans to farmers and enable them to market their products under favorable conditions.

Using wheat as an example, everyone knows that, in general, wheat is harvested throughout the country at about the same time. When harvesting season arrives, hundreds of millions of bushels of wheat arrive in marketing warehouses and terminals in a sudden flood. The product, however, is not consumed that way. The miller grinds flour and the baker bakes bread, day by day, as it is needed by consumers. If a farmer were to take advantage of the market, as do his industrial brothers, he would market his product gradually as there was demand for it. But the agricultural population is not financially able to do so. They are forced by the burden of indebtedness, the due date of taxes, and living expenses to market their commodities as soon as they are produced.

Thus it is that even if the market eventually can absorb the total of agricultural production, prices are forced down during the market season by the sudden dumping of vast quantities of agricultural commodities by producers. To remedy this condition the farm bill provides for surplus reserve loans. Producers of basic commodities can hold their products and market them gradually by obtaining loans. Credit is made available to agriculture so that taxes can be paid, living expenses cared for, and the produce of the farm can be held until market conditions are at their best.

The last and a very widely discussed section of the farm bill is the provision for marketing quotas. If agricultural production in a given year were to exceed the normal supply by more than 10 percent, the Secretary of Agriculture is empowered to proclaim a marketing quota, providing that all farmers withhold a small portion of their crop from market to prevent disastrous price declines. The marketing quota must be submitted to a vote by the producers of the commodity it affects and if over two-thirds of

them vote in favor of the quota, then it becomes compulsory upon all producers.

This is the most controversial provision of the farm bill, but it was demanded by farmers themselves who insisted that a small percentage of producers should not be permitted to destroy the program of the entire industry.

An analogy may be found in the legislative program affecting almost every other industry. The great percentage of men engaged in any business have insisted upon and obtained protection against chiseling by a few engaged in the same business. This is the fundamental principle of the marketing quota. It is not anticipated that marketing quotas would be used very often and it is a form of marketing protection which agriculture has long demanded.

All in all, the farm bill is not a radical departure. It does not instill into American economics any radical or untried theories. The measure simply seeks to provide governmental assistance to our 7,000,000 farmers, to operate their business in a sound, economic way, just as their more compact, better-organized industrial competitors have operated for more than a century. The object of the legislation is not to subsidize farming but to give it security. It is not to discriminate in favor of agriculture and against industries, but to equalize them. It is not to destroy any American principle of capitalism or democracy, but simply to give agriculture an opportunity to utilize those great principles. The farm bill is, above all, a carefully prepared, well-worked-out system to permit farmers to stabilize farming.

Agricultural Relief

EXTENSION OF REMARKS

OF

HON. ROYAL S. COPELAND

OF NEW YORK

IN THE SENATE OF THE UNITED STATES

Saturday, December 4 (legislative day of Tuesday, November 16), 1937

ARTICLE BY JOHN T. FLYNN

Mr. COPELAND. Mr. President, I ask leave that there be inserted in the RECORD a very interesting article by my old friend John T. Flynn entitled "Plain Economics." I will say that it is a splendid and a common-sense article.

There being no objection, the article was ordered to be printed in the RECORD, as follows:

PLAIN ECONOMICS

(By John T. Flynn)

NEW YORK: At the moment the Senate and House are busy with differing versions of a farm-rescue plan which no one will say, by the widest stretch of the imagination, are well-laid plans, and which, like the thought of the poet Burns, are likely to go awry.

They are hurried, ill-considered, patchwork, obscure, and full of that priceless ingredient known as politics.

Some witnesses of the spectacle are asking in wonder if these two Houses and the President are not a little abashed, even a little terrified, at the manner in which their past efforts at farm salvation have gone awry.

For instance, in 1934 the A. A. A. was set up to raise farm prices. Of course raising farm prices would inevitably cut down the sales of farm products abroad. Yet the foreign market has always been an essential spot for absorbing farm surpluses.

Of course this is exactly what happened. So then the President launched his famous and ill-starred gold-purchase plan. Its announced purpose was to get prices up still higher at home, but at the same time reduce them to the foreigner in order to expand the market for American crops.

Here was a double-barreled program, first to build the American market for the farmer at higher prices, and, second, to open up again the foreign markets to him. And then, to insure the latter, Secretary Hull began a series of foreign reciprocal trade treaties which he assured the world would increase the foreign market for our farm products.

What has happened, however, is the precise reverse of all this.

First, in 1934, when all this was begun, our agricultural exports were $787,000,000. In the same period of this year they were $733,000,000. They have actually fallen off.

In the same period the history of agricultural imports has been quite different. In 1934 imports of competitive farm products were $419,000,000. In the last fiscal year they were $868,000,000.

Our farm exports fell away; our competitive farm imports doubled.

Last year this country imported huge quantities of meats, cattle, butter, eggs, corn, and wheat. This country, "cursed" with a wheat and corn surplus, brought in from abroad 48,000,000 bushels of wheat and 78,000,000 bushels of corn, 150,000,000 pounds of meat, 428,000 head of cattle, and 15,000,000 pounds of butter.

The reasons for this are now quite plain. If the saviors had taken a little time to think in 1934, they could have foreseen this—that their program accomplished the exact reverse of their intentions.

Now they are at it again, this time in an even speedier manner.

Fifth Anniversary of the First Election of President Roosevelt

EXTENSION OF REMARKS

OF

HON. CLAUDE PEPPER

OF FLORIDA

IN THE SENATE OF THE UNITED STATES

Monday, December 6 (legislative day of Tuesday, November 16), 1937

ADDRESS OF CHAIRMAN JAMES A. FARLEY, OF THE DEMOCRATIC NATIONAL COMMITTEE, TO THE YOUNG DEMOCRATIC CLUBS OF AMERICA DINNER GATHERINGS THROUGHOUT THE COUNTRY IN CELEBRATION OF THE FIFTH ANNIVERSARY OF THE ELECTION OF FRANKLIN D. ROOSEVELT TO THE PRESIDENCY, NOVEMBER 9, 1937

Mr. PEPPER. Mr. President, I ask unanimous consent to have printed in the RECORD an able and interesting radio address delivered by Hon. James A. Farley on November 9 to the Young Democratic Clubs of America dinner gatherings throughout the country in celebration of the fifth anniversary of the election of Franklin D. Roosevelt to the Presidency.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

Ladies and gentlemen, it is my pleasant duty in this broadcast to convey the greetings of the Democratic National Committee to those young men and women who are gathered together in country-wide meetings to celebrate 5 years of progressive government under the inspiring leadership of President Roosevelt. This is more than a routine celebration because, in one sense, these meetings symbolize the reason why our party is in almost undisputed control of the Nation's political affairs.

If there is one reason above all others why the Democratic Party has been highly successful, it is found in the fact that the leadership of the party has had the common sense to give the young voters a place at the Democratic council table. In adopting that course the party has not divorced itself from the wise and salutary traditions of the past—it has merely sought to fuse the wisdom of experience with the energy, the enthusiasm, and the flaming courage which are so characteristic of youthful minds and hearts.

You know without my telling you the significant role played by the Young Democratic Clubs of America in the public affairs of State and Nation. You have been given a job to do by the high command of the party, not in a spirit of mere toleration, but with a genuine regard for the contribution you are able to make to the cause of good government. The results speak for themselves. Even our opponents, after last fall's Presidential election, were frank enough to concede that a great majority of the new voters had found their way into the party whose precepts and principles are founded on the teachings of Thomas Jefferson. We intend to keep them there.

So, then, with that fact in mind, I greet you tonight as veterans who have won your spurs in the political arena; as fellow workers with whom we labor side by side on equal terms for the great cause which means so much to the party and to the Nation.

In the past few years we have made victory a Democratic habit. Undaunted by the power and might of the forces arrayed against us, we swept to overwhelming victory in the campaign of 1936. It was the third consecutive national triumph for our party. We all like to win and naturally the extent of these victories was most gratifying. But it is well to remember that before we were permitted to experience the pleasant taste of success, our party had 12 long years during which it was compelled to watch from the sidelines and to play the role of minority watchdog to a rival party which at that time was rapidly becoming drugged from the excess of its own power.

I sometimes think that in those years out of office, the Democratic Party found the discipline, the foresight, and the courage which made it so eminently successful when the reins of Government were passed into its hands. In the first place the party never abandoned the primary principle that the true purpose of

government was to advance the well-being of the great mass of citizens. In the second place, the party had the fortitude and the bravery to return to the political battlefields undaunted and unafraid, after defeats and discouragements that would have broken the spirit of a less courageous group of men and women. In other words, the Democratic Party had confidence in itself and by that unflinching attitude, it won the confidence of the Nation.

There is a great lesson to be learned from the course of the Democratic Party when it was out of office and during the period when the only force available to keep it functioning was the deep-seated conviction that its principles were right. Conversely, there is much to be learned from the fate of the opposition during that same period. The fact is plain that the Republican Party was the victim of its own successes. It almost literally fell apart, not because of what it did, but because of what it failed to do. The vice of omission and indecision paralyzed its leadership when the Nation was praying for action. Having won election after election by the simple process of letting things drift, the Republican leaders were unable to rid themselves of the do-nothing habit.

When the country finally voted them out of office by an overwhelming majority, the captains of the G. O. P. turned over the Nation to their successors not with reluctance but with relief. Even they had come to deplore their own inability to get things done.

The story of the past 5 years has been vastly different. Our party has been solemnly accused of nearly every possible crime on the political calendar—that is, all but one. No one has yet charged that the Democratic Party is afraid to do things or that it is hesitant to accept responsibility for its own actions. We have a President in the White House who looks responsibility squarely in the face and who dares to do those things which he considers necessary for the welfare of the whole country. He never backs away, he never accepts the counsel of delay, merely because a problem is difficult or because he fears it will offend the prejudices of a powerful group in the community. Above all else, he bears in mind always the fundamental fact that the purpose of the Democratic Party and of his administration is not simply to win victories but to promote the best interests of the United States of America.

With that reason in mind, the Chief Executive has called Congress to meet here in about a week's time, nearly 2 months in advance of the next regular session, to consider legislation of vital importance to millions of citizens. He wants the Congress to formulate an agricultural policy that will insure a stabilized industry, a fair level of prices, and orderly marketing conditions to the men and women who derive their livelihood from the soil. A good start has been made in dealing with the problem—now he wants to consolidate the gains that have been made and to erect barriers against possible dangers in the years that are to come.

Another objective of the President is to find some way of raising the scale of living for those millions of Americans who, unfortunately, are compelled to exist at bare subsistence levels, and in many cases below subsistence levels. He looks upon this effort to improve the living conditions and to raise the purchasing power of the poorer classes as an essential step in the long-range plan to insure permanent prosperity for America. And so he has asked the Members of Congress to assemble this month in order that these problems may be considered in unhurried fashion and methods of action agreed upon.

Now, I am conscious of the fact, as you are, that a great many folks are disappointed over the fact that the Chief Executive has summoned Congress here for this extra session. They point out the obvious fact that it could have been avoided. They emphasize the fact that the proposals of President Roosevelt are certain to awaken sharp differences of opinion and perhaps stir up heated partisan debate.

All those contingencies were known and appreciated by the Chief Executive before he decided to act. But over against them was the bald truth that the economic and social well-being of the United States will never be established on a satisfactory basis until these problems are dealt with in honest and realistic fashion. To persist in overlooking them would be a serious error in public policy.

The wage problem and the farm problem were not born in the brain of any individual. The demand for action has swelled up in a united demand from millions of toilers and millions of farmers who are insistent upon obtaining some kind of financial and economic security in return for their daily toil. The solution may be difficult—perhaps it can be found only by a process of trial and error—but the necessity for action is too urgent to be overlooked.

I wish you to bear in mind this paramount fact at all times: If the Democratic Party fails to do the things that must be done, the task will be turned over to other leadership because the American people will no longer tolerate inaction. They want party leadership and they want party responsibility.

I think it might be well to offer a word of assurance to those who are fearful of the consequences of a party split. There is a serious split existing at this very moment—but not in our party. Our ancient rivals, the Republicans, attempted a harmony gathering and instead found themselves torn apart into hostile camps, with at least two factions ready to stage a death struggle against one another for control of party affairs. What happened at the meeting was a clear indication of bigger and better battles to come.

While the Republican leaders have at last awakened to the fact that the American electorate will have nothing to do with a party that lacks both leadership and a program, there is nothing to indicate that they know what to do about it. The Old Guard reactionaries in the G. O. P. will never yield up their place of power at the party council tables. Neither will they consent to the adoption of a liberal, forward-looking declaration of policies and principles. The only genuine hope for progressive government in this country will continue to rest on the Democratic Party. As for the talk of a dissension in our own ranks, let me emphasize that it is impossible to divide a party which has the backing of the overwhelming mass of the electorate.

The political lesson of the day is plain. The Democratic Party is in control because it is honestly grappling with those things which the American people want done. The opposition has merely reached the point of realizing its own weakness. From now on it must begin the process of building itself once again into a positive force in the Nation's political life.

There is nothing for us to fear if we escape the deadly error of inaction and reject the counsels of those who suggest evading issues as the easy way to victory. The facts are all on our side. The constructive achievements of the past few years can never be uprooted either by propaganda or by ingenious misrepresentation.

With his customary keen insight into public matters, President Roosevelt pointed out recently that the mass of citizens are taking a far greater interest in the affairs of government than they ever did before and that this newly awakened interest is a healthy sign for the future of democracy in this country. It is well for all of us to heed what the Chief Executive said, especially those of you who are charged with the responsibility of directing the affairs of the young Democrats. In the years that lie ahead, it will be your duty not only to see that the Democratic Party is well organized, but that it continues to be a party with a program and a purpose. Bear in mind that having witnessed the beneficial effects of responsible party leadership under the Roosevelt administration, the majority of the people will never be satisfied with less.

The past few years constitute a glorious chapter in the history of party government. In that time a new luster has been added to the brilliance of Democratic Party achievements.

We have won the hearty support of millions of hard-working, upright citizens who are marching forward under our banner because they are determined to realize the ideal of a free and prosperous America, unhampered by the deadly doctrines of unreasoning radicalism or blind reaction. We must never lose sight of that ideal.

With commendable determination, the Young Democratic Clubs have charged themselves with the task of making sure that the great majority of first voters continue to find their way into the Democratic Party. Because I am acquainted with what you have done in the past, there is not a single doubt in my mind that your goal will be accomplished.

In closing let me thank the young Democrats of America for their magnificent contributions to the party in the past, and at the same time extend a hearty good wish for the success of their present endeavors.

How the Tariff Hurts the Farmer

EXTENSION OF REMARKS

OF

HON. BENNETT CHAMP CLARK

OF MISSOURI

IN THE SENATE OF THE UNITED STATES

Monday, December 6 (legislative day of Tuesday, November 16), 1937

EDITORIAL FROM MEMPHIS COMMERCIAL APPEAL

Mr. CLARK. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD an editorial published in the Memphis Commercial Appeal entitled "How the Tariff Hurts the Farmer."

There being no objection, the editorial was ordered to be printed in the RECORD, as follows:

[From the Memphis Commercial Appeal]

HOW THE TARIFF HURTS THE FARMER

(Trade barriers rather than crop control are chiefly responsible for loss of foreign farm markets, says Cotton Belt newspaper; exclusion of goods from other countries makes them unable to obtain exchange with which to purchase our surpluses; urges gradual tariff reform, retaining "indemnities" for farmer in the meantime.)

There are two fundamental reasons why southern cotton has lost its dominant position in the world market—they are the high protective tariff and America's position as a creditor nation. All other factors are corollary and contributory.

Prior to the World War we owed money to the rest of the world, which we had borrowed to build railroads and otherwise expand our national industrial plant. These loans were in the form of domestic securities. When the war broke out the belligerents cashed in and bought war materials. That squared our interna-

tional debt. As the war went on, we began to lend money, and we kept right on lending up to the crash of 1929. Those lendings are still debts.

Because there is no international currency, one nation buys from another through the medium of credits in the currency of the nation from whom goods are bought. These credits can be purchased with gold and in other ways; but the chief method is through the sale of goods. If a nation has only a few dollar credits in the United States, it can buy only a limited amount of goods from us. It can get additional dollar credits only to the extent to which America is willing to buy its goods.

Until 1929 we lent foreign nations money with which to buy our goods, but they kept on getting deeper in debt and finally went broke. Hoover signed the disastrous Hawley-Smoot tariff bill of 1930, which created an even more desperate situation. In the cotton industry one emergency measure after another was applied, including the New Deal's policy of controlled production and price.

The point is that New Deal devices have not been the fundamental cause of our losses in the world market. To repeat, we have lost ground primarily because (a) the world has an insufficient number of dollar credits, and (b) it can't get more of them because the tariff limits the amount of goods they can sell us in exchange for credits with which to buy.

Opinions as to cause and effect might differ, but all conclusions point to the inescapable economic facts that prices which are determined by world supply and demand cannot be controlled within the United States, and that income for parity in the buying market cannot be brought about through natural economic forces so long as the cotton farmer sells at a price determined by the cost of production in other countries and buys at prices artificially suspended above the prices in the countries in which he sells.

The false assumptions of the tariff are, of course, well known. Its chief fallacy is that it does not create and protect a high standard of wages for American workmen. In case of a tariff levied to protect an industry where there is little domestic competition, the industry raises prices as high as possible and pockets the amount of the tariff as profit.

In the case of industries where there is keen domestic competition, both prices and wages are forced down as a result of the competition, and the tariff has no effect. It is the tremendous American market for volume sales, and not prices, that determines profits for industry and wage standards for labor. The tariff is in effect a sales tax levied for the benefit of inefficient industry; the American workman does not enjoy its alleged benefits because it is a toll taken out of his pay envelope.

That fact has not seemed to be sufficiently clear to the industrial sections of the country, nor does it appear entirely clear to them that the economic relationship of the cotton-producing section to the manufacturing sections is equally harmful to both. The South buys its consumable goods from the manufacturing sections, mostly in the North and East, but sells back to these sections a disproportionate amount of what it produces. There is, in consequence, an unbalance of trade between these sections.

That could be balanced by price parity, but, because of the tariff, the South balances it through borrowing which, as fast as compound interest can work, creates bankruptcy. It should be understood by industrial leaders and investors that if the purchasing power of the South could be increased by reason of a larger distributable income, brought about by price parity, the result would be a tremendously expanded market for the sale of domestic goods.

In this country, political leadership must soon determine whether agriculture is to be sabotaged for the benefit of a few marginal manufacturing industries.

We have said that in our judgment acreage restriction does not necessarily have to result in crop curtailment. We believe acreage restriction for conservation purposes can be brought about without political control.

The problem of the tariff, meanwhile, must be faced realistically. American goods collide everywhere with tariff walls as high as our own. We are living in a world of nationalistic self-sufficiency. American inventive genius, American industrial methods, and American financing have contributed to that self-sufficiency. Foreign workmen manufacture goods for sale in their own domestic markets with American-devised machinery, in factories built with American money.

To demolish utterly our tariff—fallacious and disastrous as it is—would dislocate trade the world around, and we, for a period of time, would also suffer. Drastic but gradual reform is more practical. We are not optimistic that much headway can be made in tariff reform in the limited time in which Congress has to fashion new farm legislation. Once again, therefore, the problem of an impoverished agriculture must be approached through the medium of artificial devices.

The Commercial Appeal believes in the justice and the economic necessity of a cash subsidy as an indemnity against the injustice and economic folly of the tariff. We would like to see it called by its right name—an indemnity.

We believe the processing tax is the fairest and soundest method yet advanced for creating a subsidy. Meanwhile, we wish to repeat and to emphasize our conviction that the way of courageous and liberal political leadership points unerringly in the direction of tariff reform, which, even under conditions of a disjointed world economy, is in our judgment not impossible.

Leadership of Republican Party

EXTENSION OF REMARKS

OF

HON. ERNEST W. GIBSON

OF VERMONT

IN THE SENATE OF THE UNITED STATES

Monday, December 6 (legislative day of Tuesday, November 16), 1937

LETTER FROM GOVERNOR OF VERMONT

Mr. GIBSON. Mr. President, the poll of the American Institute of Public Opinion appearing in the Washington Post and other newspapers of Sunday, December 5, shows that a majority of the Republicans are not satisfied with their present leadership, which has so wrecked the party that it now has a representation of less than a quarter of the membership of the Congress. The poll further discloses that the Republicans of the Nation believe that a development of new leaders is more important than a development of a new program; that they want the Republican Party to be more liberal in its social and economic viewpoint; that they pick economy, tax reduction, and restoration of business prosperity as the chief issues for a political campaign.

Hon. George D. Aiken, Governor of Vermont, the only State in the Union that has always remained loyal to the Republican Party, has issued an appeal to the Republicans of the Nation through an open letter to the Republican National Committee. I ask unanimous consent that his letter may be printed in the Appendix of the RECORD.

There being no objection, the letter was ordered to be printed in the RECORD, as follows:

OPEN LETTER TO THE REPUBLICAN NATIONAL COMMITTEE, FROM GEORGE D. AIKEN, GOVERNOR OF THE STATE OF VERMONT

DECEMBER 4, 1937.

GENTLEMEN: The State of Vermont deserves the respect and attention of the Republican National Committee. With our sister State of Maine, alone of all the 48 States of the Union, we returned a majority for our Party in the last national campaign. As elected leader of the Republican Party in this one of the remaining Republican States, it is my duty to inform you that, in my judgment, neither in Vermont nor elsewhere in the Union will we, as a national party, again receive the support of a voting majority unless your body recognizes the necessity of reorganizing and becomes responsive to the enlightened opinion of the voters whom you profess to serve.

America faces a crisis. The Democratic Party, swept into power on the wave of the depression, has now ruled our Nation for several years. During this time a large part of the vaunted liberty of our citizens, won at the cost of a century and a half of struggle and sacrifice, has been wiped away. Our children's children have been bonded to pay the costs of inefficiency; small business has been stifled; the ranks of labor have been sundered; confusion has increased, and hope has been largely superseded by despair; for millions, centralized paternalism has supplanted self-reliance, and a virtual dictatorship over a hundred thirty million educated and erstwhile free Americans is being seriously proposed and sought.

But there is still in the hearts of the great majority of our citizens a love of liberty that does not die, a desire to bring order out of this confusion, a will to make workable those proposals upon which the spotlight of time focuses our attention as desirable, and the courage to discard the great mass of unworkable or premature theories, dreamed by dreamers and seized upon by opportunists as a vehicle on which they may ride into power.

Ordinarily patriotic citizens would turn to the Republican Party as a means of combating the insidious changes coming over our form of government, but they are not doing so today. They see no hope in a party offering no constructive policy or program; a party whose leaders are apparently more concerned with controlling the party machinery than in American welfare; a party so torn by internal bickering, hopeless ambitions, and lack of direction as to be in a nearly complete state of demoralization. The body politic of American citizens demands a party of integrity and ability to which it may give allegiance. The Republican Party has a last opportunity—it may become the grand new party of America or it may not.

After consultation with leaders of opinion in the Republican Party in this State, and with their advice and encouragement, I make three demands with reference to your organization.

The first demand is that at the earliest opportunity the National Committee be purged of the baneful influence of the southern committeemen who represent no one except themselves and their allied officeholders, past and present—mostly past. Nourished on political patronage alone and used as a tool for controlling the party, this body of committeemen is your organization's greatest liability. The character of their representation is such as to preclude any possibility of securing the cooperation of the millions of patriotic fellow citizens south of the Potomac and the Ohio, and their prominence in party councils repels right-minded voters everywhere.

I suggest that each committee member be allotted to vote equal to the proportion which the Republican vote in his State bore to the total vote in that State cast for President in the last national election. The enforcement of this rule would do more than deprive a group of opportunists of unearned and misused power. It would make the position of committee member attractive only to men and women who are convinced of the possibility of building up the party in Democratic territory and are determined so to build it.

My second demand is that the national committee set before itself, as a major aim, the winning to the party of the youth of the Nation, and the placing upon it of the serious responsibilities of party leadership. We have become a party of old men. Unless we can become also a party of and for young men and young women the party will die—and the processes of dissolution have already begun. It is obviously necessary not only to draw the younger party members into counsel, but necessary that there be a program for party policy and later for party platforms which appeals to the keenest intelligence and highest aspirations of American youth.

My third demand is the immediate preparation of an affirmative program. Among the points acceptable in such a program I suggest the following:

First. Accept in general the social aims which the opposing party has had the wisdom to adopt, but has lacked the ability to put into efficient operation.

Second. Reject decisively the use of enormous expenditures and special benefits as a political expedient for attaching agriculture, industrial groups, and other workers to our party. We can never outbid our opponents and we should be ashamed to try. Our claim for support must be made on higher grounds.

Third. Instead of offering a place at the feed trough, invite the youth of the Nation in all occupations and in all walks of life to work together to produce and distribute, by the labor of head and hand, a larger volume of goods and services for more people of the Nation. Emphasize what we can give and do—not what we can get.

Fourth. For the sake of all of us, recognize both the fundamental importance and the peculiar difficulties of the business of agriculture. Encourage the farmer in self-support and in the preservation of the fertility of his soil, provide means for carrying over the surplus of bumper years into the lean years, and on crops whose prices are made in the world market provide a subsidy on domestic consumption that is the equivalent of the tariff subsidy available for manufactured goods. I believe that all this can be done without detriment to the annual purchasing power of the industrial worker, without imposing production control on the farmer, and without destroying the foreign market for his surplus. We can surely avoid in this last respect the mistakes of the present administration whose policies have dangerously crippled our farm market abroad, and have so done in the face of the obvious failure of similar experiments with British rubber and Brazilian coffee.

Fifth. The industrial worker must be assured of his fair share of the Nation's production. We ask as the main objective to this end an expansion of employment and increase of production. The consequent demand for his services will assure him of both an increased pay envelope and increased actual purchasing power for the enjoyment of himself and his family. Everything has been tried but this, and nothing but this will serve the worker's needs.

In the interest of the small businessman upon whom the perpetuation of free competition depends, we demand the restriction of monopolies and a minimum of regulation. When regulation seems necessary, the Government should bear in mind the difference between large and small industries and their respective abilities to bear regulatory burdens. Free competition fosters personal initiative, aids the smaller communities, and also reacts to the benefit of the consumer.

Sixth. For all workers, whether in industry, agriculture, or the service occupations, we further demand the coordination into a rational system of our present unrelated policies of governmental borrowing, expenditure, employment, and relief on the one hand, and private employment, taxation, and debt repayment on the other.

Seventh. The neglected element in the preceding demands is a proper relationship between Government and business. It is imperative that Government shall look upon business as the source of production, employment, and consumption, and that private industry be fostered to this end. It is the corresponding duty and interest of business to meet more than half way the honest overtures of an honest Government. In this mutual respect and understanding of business and Government depend the solutions of most of our yet unsolved problems. A more profitable and active private business can and will pay larger real wages, make a better market for the farmers' produce, draw into its workshops the surplus population of the farms and thereby reduce the surplus farm production and raise farm prices. And a prosperous business can and will, through higher wages, salaries, and dividends, pay the taxes needed for the maintenance of our social program and reduction of our public debt to a point where national credit can safely withstand a peace or wartime emergency. No other source of financial support is available.

Eighth. We must defend the rightful sovereignty of the States, not because of our attachment to some outworn doctrine of States' rights but because the well-being of the people demands that we do so. The shift to Federal rule results in an unwise relinquishment of local responsibility. The process is insidious. First we exchange self-reliance for dependence on local and State government; then we yield local and State responsibility to the Federal Government. Such yielding in the majority of cases induces a weakness of character in our citizenship which our party must make every effort to prevent, whether among our own members or in the body politic at large. It is particularly necessary that young men and young women be infused with the sense of personal responsibility for local government. The other aspect of this problem is that the Federal Government is taking on itself powers too great and too complicated to be successfully used. As a result, we are now on the point of legislative and administrative break-down, a situation whose consequences we scarcely dare imagine.

Ninth. Finally, we must preserve all useful elements in our form of government and change only by constitutional means those whose usefulness has ended. We must return to Congress its legislative and deliberative functions. We must preserve the authority, integrity, and independence of our courts. We must refuse to the Presidency a blanket grant of power by methods or for purposes unauthorized by law and unrevealed before the elections, but should strengthen it and its supporting staff in the gathering of information and the making of wise and constructive recommendations.

With the break-down of parliamentary governments and the growth of personal power and rule in Europe as our warning, and with the harassed state of the peoples living under them as our warrant, we must sound a trumpet call to the citizenship of America, young and old, to take upon itself the responsibility for making this Nation truly great and its Government truly a minister to the needs of its people; and that trumpet call must summon them not merely to legislative halls and to the polls, it must summon them as well to farm, store, and factory.

To purge the party organization of its reactionary and unfair elements, to focus its forces on the recognition of the youth of our Nation, to prepare immediately an affirmative program—that is the demand which the Republican leadership of Vermont makes on the Republican leadership of the Nation.

If that demand is not met, we must look elsewhere for an organization through which thoughtful and devoted Americans of North and South, East and West, can join together to work for the good of all.

Sincerely yours,

GEORGE D. AIKEN,
Governor of Vermont.

Working Conditions in the District of Columbia

EXTENSION OF REMARKS
OF
HON. VIRGINIA E. JENCKES
OF INDIANA
IN THE HOUSE OF REPRESENTATIVES
Monday, December 6, 1937

Mrs. JENCKES of Indiana. Mr. Speaker, I desire to bring to the attention of the Members of the House of Representatives a most important situation which has developed here in Washington, D. C., during the past 10 days.

This situation will no doubt have a decidedly unfavorable effect on the workers in your own congressional districts.

We Members of the House of Representatives have heard a great deal of talk and the Congress has spent much time on legislation to promote fair practices toward labor and fair standards of practice in industry.

We Members of the House of Representatives have always had the interest of our American workers and those who must toil at heart.

The Congress has made sincere efforts to better the condition of wage earners throughout the Nation.

However, as the citizens of the District of Columbia are not permitted to vote, and as the citizens of the District of Columbia, therefore, do not have elected Representatives in this House or in the United States Senate, those who toil and labor in the District of Columbia are without direct elected representation in their Nation's Congress.

Their only recourse is through an appeal to the Members of the Congress who happen to be appointed to the District

of Columbia Committee of this House of Representatives or of the United States Senate.

An urgent appeal has been made to me by my constituents in the Sixth Congressional District of Indiana, and by other citizens of the State of Indiana.

The Honorable L. P. Lindelof, who is the general president of the Brotherhood of Painters, Decorators, and Paperhangers of America, with headquarters at Lafayette, Ind., and whose subsidiary local unions are situated in Terre Haute and other cities in my congressional district, has advised me that there exists a deplorable situation at the Woodward & Lothrop Department Store in the District of Columbia. This deserves the attention of the Congress, not only from the viewpoint of protecting our own constituents but because, while we are only temporarily located in Washington, we are at this time patrons of the Woodward & Lothrop Department Store, which is undoubtedly one of America's very fine merchandising establishments. I have endeavored to ascertain the facts, and I ask you, my colleagues, to also become interested in behalf of your own constituents in your own congressional districts, and I am sure you will disclose some surprising conditions, which deserve the attention of, and possibly the correction by, the Nation's Congress.

Large groups, members of organized labor unions, particularly the long-established Painters' Union Local No. 368 of Washington, D. C., which includes many citizens of my congressional district who are craftsmen in this local painters' union, came to my office and asked for justice.

Painters' Union Local No. 368 of the District of Columbia has had from 75 to 100 pickets surrounding the Woodward & Lothrop Department Store for the past 10 days.

Mr. Bryce P. Holcombe, business agent of Painters' Union, Local No. 368, has advised me that the executives of the Woodward and Lothrop Co. refuse to recognize and employ any painters who are members of an organized labor union, while all other department stores in the District of Columbia do employ union craftsmen. The strange phenomenon of this situation, in which it differs from others, is that organized labor seems to be unable, and is totally unable to get its story before the public through the usual channels. It has been reported to me by Mr. Holcombe that this is apparently because the Woodward and Lothrop department store is one of the largest purchasers and users of advertising space in the local Washington newspapers. Mr. Holcombe has advised me that rumors are widespread in local labor circles that the firm of Woodward and Lothrop has an internal union commonly called a "company union."

I am this day officially bringing this situation to the attention of the Secretary of Labor as well as the National Labor Relations Board, and I have asked these Federal agencies to become active in a searching investigation to develop the true facts, in order that the rights of those who work and toil may be safeguarded under the law, as was the intention of the Congress, when laws protecting the rights of labor were enacted.

I am greatly interested in the protection of industry. We must have successful, prosperous industries, capable of distributing great quantities of articles of high value at the lowest possible cost to the American consumers. This distribution should be carried on with a legitimate profit, which should enable corporations to declare legitimate dividends to stockholders, after having paid good wages under good working conditions.

It is my understanding that the firm of Woodward & Lothrop has made large profits in the past, and it would be of interest to this Congress to know to what extent those who invest their labor and devote their lives to the service of this company also participate in the profits, by means of a fair wage under proper working conditions, commensurate with an American standard of living.

In conclusion, I wish to say that it has been my observation that organized labor has always stood for the protection of industries which provide a fair wage commensurate with our American standard of living.

I appeal to you, my colleagues, to become interested in this situation, which will be an act in favor of your own constituents who also labor and toil.

The Wage and Hour Bill

EXTENSION OF REMARKS
OF
HON. FRANK HANCOCK
OF NORTH CAROLINA
IN THE HOUSE OF REPRESENTATIVES

Monday, December 6, 1937

LETTER FROM HON. FRANK HANCOCK, OF NORTH CAROLINA, TO ONE OF HIS CONSTITUENTS EXPLAINING HIS VIEWS ON THE WAGE AND HOUR BILL

Mr. HANCOCK of North Carolina. Mr. Speaker, under the leave to extend my remarks in the RECORD, I include the following:

NOVEMBER 4, 1937.

MR. KARL BISHOPRIC,
Spray, N. C.

DEAR MR. BISHOPRIC: I am grateful for your recent letter comparing the Black-Connery bill, as passed by the Senate, with the bill as reported by the Labor Committee of the House, which as a result of the discharge petition will automatically take its place on the Calendar of Motions and be before the House on December 13 for consideration. In keeping with my concept of true Democratic procedure, I shall vote to discharge the committee, but unless the measure is radically revised in several vital particulars it is my intention to vote against its passage. Notwithstanding my hearty approval of both its social and economic objectives, I am firmly convinced that in its present form it is administratively infeasible and that its application could not be other than injurious to the country and particularly harmful to a majority of the unorganized group of workers it is designed to help; and the more I learn of its probable effect the larger the doubt grows in my mind as to its desirability and soundness.

Recent economic disturbances and dislocations seem to accentuate both the untimeliness and unwisdom of the enactment of this measure in its present form. Though the bills under consideration are designed to apply only to unorganized or under-privileged workers, it is generally conceded that under either of them a considerable proportion of the working population of the country would be brought within the scope of a Federal regulatory system which would remove or greatly reduce the incentive to extend trade unions to hitherto unprotected fields of employment. Organized labor seems to be quite properly conscious of the fact that these persons would quickly become proteges of the Government and be assured of certain minimum rates of pay, which would always constitute a serious danger that such minimum rates would become a test of the adequacy of pay in organized industry. At first blush, Government intervention of this kind might seem to help the cause of organized labor; but upon more careful reflection it is apparent that this would not be true, for the reason that a forced product is not as sturdy as a normal, uncoerced growth. If Government control and regulation should spread in this direction, as experience proves that it always has done, we would shortly witness in my opinion the disappearance of real free labor organizations and their consequent replacement by a system of Government control over working conditions like that found in many of the European states.

In view of my convictions about the measure I wonder if it would not be the part of wisdom and statesmanship for Congress to confine itself at this time to legislation against the products of child labor in interstate commerce, leaving the question of minimum wages and maximum hours for adults to be dealt with by collective bargaining, as provided in the Wagner Labor Relations Act. However, if a minimum wage and maximum workweek must be established on a national basis, the standards should be determined by law and not by decrees of a bureaucracy as now permitted in both bills. Furthermore, the standards should be set at such a point as not unduly to unbalance economically those areas in which money wages are, because of peculiar circumstances, below average levels. In this connection I cannot but keep in mind the unfair and unjust freight-rate discrimination that has obtained against our industries since almost the development of industry in the South. It is also pertinent, I feel, that in the consideration of this measure we keep in mind the true economic fact that increase in the average worker's purchasing power rather than increase in money wages is what counts in bringing about a real increase in the Nation's productive and consumptive capacity.

You will recall that the President's message stated that most fair labor standards, as a practical matter, require some differentiation between different industries and different localities. The inference here would seem to recognize a regional rather than a national program, though I concede that there is some weakness in

such a contention, and especially because of the growing interdependence of the various sections of our country. On the other hand, the President makes it very clear, based on the long and exhaustive study of his aides and experts, that in the consideration of this question from a national viewpoint there are certain rudimentary standards which should be given general and widespread observance and the lack of observance of which must be regarded as socially and economically oppressive and unwarranted under almost any circumstances. Unquestionably he has in mind those few employers who continue to exploit helpless and unorganized men, women, and children through payment of unfair, indecent, and starvation wages. In my opinion no industry, regardless of its location, which depends for its existence or success upon a standard of unreasonably long hours and unreasonably low wages is entitled to the respect of the people or the consideration of the Government, and the sooner it "folds up" the better off society, industry, and the country will be.

I join you in the hope that between now and December 13, when the wage and hour bill will come to the House floor for debate and amendment, members of the committee will give further serious consideration to the wisdom of requiring Congress to fix the wage and hour standards and eliminate from the bill all provisions delegating that legislative power to executive department bureaucrats. Unless this is done, it would be contrary to all experience to expect a board, as now provided in the bill, to do other than constantly reach out for more power over labor and industry, which would in time no doubt bring about the downfall of our economic system of industrial and social freedom. Such delegation of power to a board, unaccountable and irresponsive to the will of the people, would also make impossible the administration of the law in such a way as to contemplate a minimum of governmental coercion and would serve to lessen the incentive for self-regulation which has been the typical American way between those who work and produce and those who direct the work and provide the means for production. It is my fervent hope and sincere trust that such measure as may be enacted will bring peace and happiness to both labor and capital and create between them a genuine partnership in industry and business. Such an achievement would at least be a rough attempt to institutionalize our Christian philosophy.

With good wishes, believe me,

Very sincerely yours,

FRANK HANCOCK.

Wage and Hour Bill

EXTENSION OF REMARKS

OF

HON. DONALD H. McLEAN

OF NEW JERSEY

IN THE HOUSE OF REPRESENTATIVES

Monday, December 6, 1937

RADIO ADDRESS BY HON. FRED A. HARTLEY, JR., OF NEW JERSEY, FRIDAY, DECEMBER 3, 1937

Mr. McLEAN. Mr. Speaker, under the leave to extend my remarks in the RECORD, I include the following radio address by my colleague, Hon. Fred A. Hartley, Jr., of New Jersey, Friday, December 3, 1937:

Every decent American citizen wants to put an end to the sweatshop and stop the exploitation of labor as soon as possible. No individual, political party, or organization has a monopoly of concern over the welfare of our underprivileged, and the desire to lead them to the "more abundant life." However, the solution of this problem requires more than a kind heart. The road to economic hell for both capital and labor may be easily paved with the best of intentions.

The wage and hour bill about to be considered by the House of Representatives is just such an example. Permit me to unmask this legislative wolf in sheep's clothing. This bill is based upon the popular, but none the less grave, misconception that Washington has the answer for everything, and that Congress can legislate prosperity. However, the law of economics is not an act of Congress. Of course wage rates may be raised by governmental fiat, but real wages cannot. Sixteen dollars a week may be established as a minimum weekly pay, but who will profit if that $16 buys only $8 worth of food, clothing, and shelter? And that can happen here.

We are told that this measure will raise the wages and lower the working hours of the exploited workers of America. As a matter of fact, it does nothing to help the poorest paid of all, the farm laborer, whose average weekly wage for 1937 was $4.76. These low-paid, long-hour tillers of the soil who constitute the largest element of that "third of the people who are ill-fed, ill-clad, and ill-housed" are excluded from its alleged benefits while their living costs are being raised by it.

This bill will apply almost exclusively to industrial workers, and when we stop to consider the many exemptions such as seamen, fishermen, all public employees, those employed in administrative, executive, or professional capacities, all piece workers, so-called white collar help, domestic help, outside salesmen, those toiling for department stores, 5- and 10-cent stores, chain stores, hotels, and all other local retail and intrastate businesses, we find that but a small percentage of the Nation's workers will obtain increased wages. As a matter of fact, the only real beneficiaries under the bill will be the 35,000 or more politicians who will be added to the Federal pay roll to run the works, or, should I say, ruin the works. On the other hand, in thousands of industries paying wages above the bill's requirements but affected by the hours provisions, there will be a loss in wages to workers. For example, workers paid 60 cents an hour and working 48 hours per week may be cut down by the Fair Labor Standards Board to 40 hours, resulting in a weekly loss of $4.80 in pay. Is that what American labor wants? As Dorothy Thompson has said, "It is a share-the-poverty law with a vengeance."

This measure sets up certain standards that must be met by all American industry. If our industry fails to meet these requirements, it is denied the right to ship in interstate commerce, but what about the products of Chinese coolies, Russian slave labor, Argentine peasants, or Japanese labor, paid $2.70 for a 60-hour week. There's nothing in the bill to stop them from shipping their products in interstate commerce. And so we find American industry ordered to raise wages while its market is turned over to foreign low-wage competitors. Is this legislation for the benefit of the United States or the rest of the world? Some of our labor will get a pay raise all right but for how long will they have jobs?

And now we turn to the latest alphabetical combination, the F. L. S. B., the Fair Labor Standards Board, to be created by this proposed act. A politically controlled board empowered to discriminate between one industry and another, one State and another, and between one section of the country and another, five omnipotent dictators to guide the destiny of all American industry and labor as well. A "roving commission" such as has already been declared unconstitutional by that recognized liberal, Mr. Justice Cardoza, given power to make laws, administer them, and invoke the police powers to enforce them. Where will you find five such Solomons for ten thousand dollars a year, or at any price? That, my friends, is government by fiat.

Such a board could by intent literally ruin any individual manufacturer it might desire, and it could ruin manufacturers by the score through errors of judgment alone. These objections also hold good should the administration of this act be transferred to the Department of Labor.

The current business recession which is rapidly developing into another real depression should be sufficient evidence of the adverse effect of continued political interference. Business will adjust itself to the new social trends far more quickly by natural economic laws than by more artificial legislative stimulants. Fixing arbitrary standards to apply to millions of workers in thousands of industries is like prescribing a patent medicine as a cure for all disease. However, industry will not alone suffer from the effects of this legislation.

The leadership of the American Federation of Labor wisely recognized that this bill might easily sound the death knell of the organized-labor movement. What will be the incentive to join a union if the Government is to set the hours, wages, and other conditions of employment? And who is there who contends that the workers of America will be better served by the politicians than by labor's established leaders exercising the rights of collective bargaining? A board which has the right to raise wages also has the authority to lower wages. In the light of its many complications and the serious and adverse changes in the industrial life of labor and the Nation since the measure was first reported, the A. F. of L. suggested that the bill be recommitted to the House Labor Committee, where hearings might be held. This was refused. Imagine this 55-page measure of 25 sections and innumerable subsections vitally affecting the economic life of the Nation being jammed through Congress without even a public hearing. What can be expected of legislation so enacted?

Pass this bill and gone with the wind is local self-government and the sovereignty of the States. Gone with the wind is our democratic system of government and all the institutions we hold dear. There is a right way to do almost everything and there is a proper approach to the objectives of this legislation which may be done within the Constitution, and that is for Congress to say to the various States, labor conditions within your own borders are primarily your own concern, but if you permit substandard conditions to exist there you will not be permitted to send the product of such substandard labor into other States or areas where goods of higher labor standards are competing. In other words, such a proposal would preserve the rich national market to the States having the highest labor standards instead of lowest, as at present. Of this plan Gen. Hugh S. Johnson, whose experience in matters of this kind is unsurpassed, has said:

"With one stroke it reverses the downward pull of degraded labor everywhere and makes the entire pull from the high standards upward. It preserves the constitutional authority of the States to regulate their own internal affairs, to regulate their commerce up to the point where it affects more States than one; even more than that, it preserves us from dictatorial bureaucracy. It prevents centralization in one-man government, it substitutes economic persuasion for political dictation, and is the most complete and simple answer to the whole vast problem."

This idea is within the Constitution in that it is based on the act prohibiting prison-made goods in commerce, the constitutionality of which has been upheld by the Supreme Court.

The administration wage-hour bill as previously pointed out could affect in its operation only a very small percentage of low-paid long-hour labor engaged in interstate-commerce industry. My suggestion enables the States to include in their legislative acts not only the workers in the interstate industries but also those employed within the State.

It is fully recognized by everyone that any wage-hour legislation is purely experimental, and the danger of the administration bill is that the Federal Board would have to set up a "guinea-pig laboratory" in which to experiment on both labor and industry throughout the whole United States. The measure I propose offers a more gradual and safer method of arriving at what eventually would become more or less national standards for wages and hours.

If we are to do this job, let us approach it properly; let us look where we are going before irreparable harm has been done. May we realize that there is no difference between the interests of capital and the interests of labor, and that legislation hurting one injures the other. Above all, may we understand that there will be more jobs and better pay for all when the politicians and theorists permit that initiative, which made this the most prosperous Nation on earth, to go to work once again.

The Futures Market, That Is, Gambling in Grain Futures, Not Supply and Demand, or Tariffs, Fixes Farm Prices

EXTENSION OF REMARKS
OF
HON. JOHN A. MARTIN
OF COLORADO
IN THE HOUSE OF REPRESENTATIVES
Monday, December 6, 1937

On the bill (H. R. 8505) to provide for the conservation of national soil resources and to provide an adequate and balanced flow of agricultural commodities in interstate and foreign commerce.

Mr. MARTIN of Colorado. Mr. Speaker, under leave granted by the House, I submit a letter written to me by Mr. Ernest D. McDougall, a former resident of my home city, and a deep student of and writer and speaker on farm problems:

WASHINGTON, D. C., *December 6, 1937.*

Hon. JOHN A. MARTIN,
House Office Building, Washington, D. C.

DEAR JOHN: Ever since our early acquaintance, back in Pueblo many years ago, I have followed your public career with great interest and approval. I am glad to know that you are taking an active part in the debate in the House on the farm problem.

On reading newspaper accounts to date of the congressional debates on this important subject, I am led to fancy that I hear the joyful shouts of justifiable jubilation of the city slickers in La Salle Street in grateful recognition of the close cooperation they are getting in the Nation's Capitol.

There are a few fundamental facts, as obvious as a sore thumb, which many of the Senators and Representatives seem disposed to overlook:

First. The antitrust laws, including the Robinson-Patman Act, apply only to industrial trusts and combinations in restraint of competitive trade; and, as expressly stated, they do not apply to agriculture.

Second. The law of supply and demand does not and cannot apply to agriculture in the fixing of American prices for American-grown commodities sold and consumed in the United States, because agriculture is not organized in such a way as to bargain freely in the market place.

Third. Contrary to the fact in the market for industrial products, the market for farm products is regulated and ruled by a ticker tape, which does not pretend to fix American prices for American supplies, but which claims to fix world prices on the basis of world supply and demand, not on the basis of domestic supply and demand.

Fourth. Contrary to the fact in the industrial field, neither a protective tariff nor an embargo tariff can insure to producers a fair price for farm products in the domestic market, because the market is regulated and ruled by a ticker tape which, in theory, fixes prices on the basis of world supplies and world demand, regardless of national tariffs.

Fifth. So long as the market for farm products is regulated and ruled by a ticker tape assuming to reflect world prices, producers of supplies for domestic consumption cannot receive anything but world prices, unless, year after year, the Government pays cash to the producers equivalent to the difference between world prices and the prices which American producers ought to receive.

Sixth. The annual cost of trying to legislate on the basis of domestic supply and demand and at the same time trying to preserve the "futures market" is (a) the total sum of the Government's cash benefit payments to farmers; plus (b) billions of dollars of speculative losses; plus (c) millions of dollars of futures brokers' commissions; plus (d) billions of dollars of difference between world prices and the prices American farmers ought to receive for domestic supplies of farm products.

It is sad, indeed, to behold the tragic spectacle of American statesmen struggling, in confusion, to legislate justly for agriculture. I dread to contemplate what the historian of the future will write about the messy, ill-considered legislation we are seeking to foist upon the more than 6,000,000 farmers of this country. The Congress is now hastily trying to enact farm legislation of a permanent character. That is inexpressably sad. There is ample time remaining prior to the marketing of next year's crops, to legislate deliberately for market control. That is the sensible course for the Congress to pursue.

I hope that somehow our legislators will find opportunity to take a fresh view of the vital problem of farm markets and farm prices.

Very sincerely,

ERNEST D. MCDOUGALL.

Gambling in Farm Products

EXTENSION OF REMARKS
OF
HON. USHER L. BURDICK
OF NORTH DAKOTA
IN THE HOUSE OF REPRESENTATIVES
Monday, December 6, 1937

Mr. BURDICK. Mr. Speaker, speaking further on the question of what can be done to put the farmers of this Nation in a position to help themselves, I note that very little has been said about the detrimental influences of "grain gambling," on the principal markets of the country. I realize, of course, that we have been assembled here to take emergency action to correct a farm situation that is now critical in the extreme, and I propose to go as far as any Member in passing emergency legislation to meet the situation. Under the terms of H. R. 8505 I am fully convinced that we are not passing emergency legislation. For that reason I have used whatever powers I possess to make this bill better—not to destroy all legislation, but to pass such a measure as will meet an emergency situation.

The best proof that we are doing nothing in this bill to meet this situation is that no new appropriation is contemplated and no process taxes appear in the bill. This being true, then it is conclusive that we can pay the farmers no more in benefit payments in 1938 than we would if we did not pass this act at all. The chairman of the Committee on Agriculture, in response to inquiries during the debate thus far, has stated that no new appropriations are contemplated.

My position has been and now is that in this emergency, with all farm products selling far below the cost of production—wheat, cotton, and corn in particular—that we should immediately establish a minimum price on wheat and corn to cover that portion of these crops consumed within the United States and that the surplus, if any, can be sold by the owners for what they can get anywhere they can get it.

That is not all we can do now. We can also plan for permanent stability to farm prices, and one of the ways to plan for the future is to pass House Resolution 356, which I introduced in this House on November 19—

providing for the appointment of a Select Committee on Futures Trading to investigate and report to the House its findings and recommendations for further legislation as to futures trading in contract markets, especially as to short selling and margin requirements and as to alleged violations of the Commodity Exchange Act, with reference especially, but not exclusively, to wash sales, cross trades, accommodation trades, and fictitious sales; providing an appropriation therefor; and for other purposes.

If anyone doubts the evil effects and the depressing influence of gambling in farm products, let me cite the fact that during the fiscal year of 1937 the Chicago Board of

Trade sold 8,050,872,000 bushels of wheat and received 37,433,000 bushels. In other words, for every bushel received in Chicago 215 bushels were sold. Any one person or any group of persons, with proper and adequate financial backing can and does go into any grain market and sell fictitious wheat and those sales are not distinguishable, to the general public, from the sales of actual wheat. The result is that the price is pounded down and down. When the gambler has operated in sales long enough to have driven the price down, he immediately buys in an equal amount of grain at the pounded down price and cashes in on his transaction. He leaves the wheat pit with money he never earned and money that should have gone to the producers if he, as a gambler, had been prevented from this nefarious practice.

While this practice is supposed to be regulated under authority of the Commodity Exchange Act, the fact is that these sales of fictitious commodities are going on and on, unmolested. The Chicago records here cited prove the impotency of the Government under the Commodity Exchange Act.

A further explanation of the operations of these wheat pits may throw further light on this whole farm-price situation.

Let us see if we can unscramble this mess. The theory of scarcity is admittedly out. The theory of ever-normal granary is in. What I should like to discuss now is the reason why, in the presence of the futures market, the protective tariff and the law of supply and demand will not operate to give the farmers reasonable prices for the products of their farms.

The fatal fallacy lies in believing that the balancing of domestic supplies with domestic demand will result in fixing fair prices in the domestic market. The theory of the law of supply and demand is that, with a supply in excess of demand, the price will decline; that, with a supply below demand, the price will rise; and that, with a supply just equal to demand, the price will be just what the product is reasonably worth to the buyer and what the seller is willing to take.

These ideal conditions are not present in the futures market, so far as domestic supplies are concerned. In the first place, the farmer has nothing to say as to the price he would like to receive, because his prices are determined by the ticker-tape of the futures market. In the presence of the futures market the farmer is not a free agent in selling his crops. He must take what is offered by the market gamblers. The law of supply and demand cannot operate under such conditions.

I wish to point out the further fact that the futures traders do not claim that, as to the domestic market, the law of supply and demand can operate. What they claim is that the futures market reflects the price resulting from the operation of the law of supply and demand in world markets, not in domestic markets. But the Congress of the United States is not planning to frame legislation to fix the price of farm products in world markets. Our job is plenty big to fix American prices for American farmers. What we are trying to do, if I am not very much mistaken, is to fix prices for American products sold and consumed in America.

The Chicago Board of Trade futures market cannot fix prices for farm products both on the basis of world supply and demand and also on the basis of our American standard of living and American production costs. That is an obvious fact which seems to have escaped the attention of those who are trying to frame legislation indirectly to fix the price of farm products and at the same time to preserve the business of the gamblers. Such an accomplishment is obviously beyond the power of finite man.

I wish to read an excerpt from a decision of the Supreme Court of Illinois, the case of *Cothran* v. *Ellis*, 125 Ill. 496, 500, speaking of the futures market and the law of supply and demand, as follows:

> Through its instrumentality the laws of supply and demand have been reversed, and the market is ruled by the amount of money its manipulators can bring to bear upon it.

Whether or not the futures market reflects world prices resulting from the operation of the law of supply and demand I shall not argue at this time. All I need to say is that that is what the futures traders claim for their futures market. As to the American market, however, it is commonly understood that futures quotations, as indicated by the ticker-tape, are the result not of the volume of supplies of domestic sellers and the volume of demand of domestic buyers but rather the result of operations of the bulls and bears as they play the market up and down according to the rules of a gambling game which the courts have repeatedly denounced.

As to the tariff, I should like to quote from a statement made by Dr. A. G. Black, Chief Economist of the U. S. Department of Agriculture, before the Senate Committee on Agriculture and Forestry, on August 19, 1937. He said:

> The tariff wall would not do that (raise domestic prices). You could have an embargo tariff on these domestic products, but that doesn't necessarily mean that these prices will go up at all. We saw that in 1932, where we had a tariff of 25 cents a bushel on corn, but our corn price was 8 and 10 cents.

At the same time there was a 42-cent tariff on wheat and wheat sold here at 30 cents a bushel.

The tariff will not work in the presence of a futures market. The tariff, however, will work where a direct attack is made on the problem of giving the farmer a stable market price. Stable prices and futures markets do not mix. One cannot bet at the roulette table unless the wheel is in motion. Neither can a futures market operate in the absence of continual fluctuation of price quotations. The tariff does operate as to industrial products. That is because prices of industrial products are not determined by the ticker tape of the futures market. The tariff will work for the farmers if we give them a stable market. It will not work in a cash market that is subject to manipulation by the gamblers who run the futures market.

We, as representatives of the people, now face the necessity of choosing to legislate for the commodity gamblers or for the farmers. We cannot do both. I am sure that the subject of futures trading has not yet been thoroughly investigated from the farmers' point of view. I have introduced a House resolution for such an investigation. The number is House Resolution 356. I believe that that resolution, which has been referred to the Committee on Rules, should be reported out favorably and should be adopted by the House. Meanwhile, I think that the pending bill should be sent back to the Committee on Agriculture for further study.

It is quite certain that if we are going to work on the theory of the law of supply and demand to determine prices of domestic supplies of farm products we shall be obliged to get rid of the futures market. If, on the other hand, we should make a direct attack on the problem of stabilizing agricultural prices at a reasonable level, then the futures market will fade out of the picture automatically, just as it did during the World War when prices of farm products were stabilized.

In conclusion, Mr. Speaker, I wish to point out a few very significant facts about the futures market that are not generally understood. The Chicago Board of Trade is not the largest grain market in the world. It is not a grain market at all. It is a futures market, where they trade in futures contracts concerning the future fluctuations of prices. Minneapolis is the largest grain market in the country. Chicago stands sixth or seventh down the list of grain markets in the United States. The volume of buying and selling grain, as merchandise is so small, that the Chicago Board of Trade does not even go to the bother of marking their merchandise transactions up on the board. The big board is reserved exclusively for recording futures transactions; not all for cash or merchandise transactions.

I wish to mention also the further fact that the futures market is not a market for the future delivery of grain or any other commodity. No deliveries are ever made in the futures market. It is said that less than one-half of 1 percent of the volume of futures transactions results in delivery.

The further fact is that such deliveries as are made under futures contracts are not made in the futures market but in the cash, the merchandise, market. Everyone who sells in the futures market sells short, whether he be hedger or speculator. No one ever enters the futures market with the idea of making or taking delivery of anything. If he later changes his mind and wants to get rid of some actual grain under a futures contract, he must step out of the futures market and convert his futures contract into a cash contract and make his delivery in the cash or merchandise market.

It may be well to ask: If all sellers in the futures market sell short, what, then, do the buyers buy? They buy a chance; they buy a lottery ticket, half of the numbers of which are losing numbers. There is not a kernel of grain, not a penny of purchase money back of a futures contract. There is nothing back of it except margin money, which is put up by both "buyers" and "sellers." The futures contract is a gambling contract, pure and simple, as the courts have consistently held.

The stock argument for futures trading is that the futures market gives to millers and other handlers of farm commodities the opportunity to hedge. It might more truly be said that it creates the necessity for millers to hedge. It is the fluctuations of the futures market against which the hedging is done. Millers do not like speculation or gambling. They play the futures market in self defense against the havoc futures fluctuations bring to their investments in cash grain, as merchandise. Millers would much prefer to buy their wheat in a stable market, as other businessmen buy their stock-in-trade in a fairly stable market, without the intervention of futures trading. Whichever horn of the dilemma we chose to take, whether to aid the farmer in realistic fashion by means of the operation of the law of supply and demand or by directly fixing the prices of farm products at a proper level, we must reconcile ourselves to the idea of giving up all thought of preserving the futures market. There is the real problem that we face, no matter what theory of farm legislation we pursue. To dodge this problem presented by the futures markets is to continue to run down blind alleys, as we have been doing up to date. To dodge this problem is to fly in the face of fate.

If we are sincere in doing something for the increase of the price of farm commodities, let us take action now in outlawing for good the practice of unconscionable gamblers who profit on the misery of 30,000,000 people. The farmers generally have known of this situation for years, but for some reason, not at all explainable, the gamblers have been permitted to continue merrily on and sell and resell necessaries of life to the deplorable loss of the farm population and to the acute financial distress of the whole country. If the millions filched from the farmers by entrenched gamblers were permitted to be added to the farmers' purchasing power, every business interest in the Nation would receive the benefits. From a selfish standpoint, if not through the dictates of human sympathy, the businessmen of the Nation should back this resolution and stop a limited few from destroying the Nation.

Is the Press Next?

EXTENSION OF REMARKS

OF

HON. FRED L. CRAWFORD

OF MICHIGAN

IN THE HOUSE OF REPRESENTATIVES

Monday, December 6, 1937

Mr. CRAWFORD. Mr. Speaker, the year 1937 will go down in history as a year of tampering with the Federal court system and the year patriots demonstrated the pen is mightier than the sword and put down the rebellion against judicial independence by writing their indignation to Congress.

We are about to enter a new year and harbingers of a drive against another cherished liberty of the Republic may be seen lurking on the horizon. Whether they will be so bold as to linger when the rays of light of public opinion fall upon them remains to be seen.

I refer to the freedom of the press. Recent slaps at the press both directly and indirectly by the present administration impels me to draw attention to this matter today.

Published reports from four separate and distinct fronts indicate a sudden outward unfriendliness toward the freedom of the press on the part of the New Deal.

Thomas Jefferson, in his first inaugural address, said:

> Freedom of religion, freedom of the press, freedom of person under the protection of habeas corpus, and trial by juries impartially selected—these principles form the bright constellation which has gone before us and guided our steps through an age of revolution and reformation.

These principles have not dimmed one iota in forming the constellation that has shown on the Republic in the nearly a century and a half since those words were uttered. They not only carried us through the trials of a new-born nation of the days of Washington and Jefferson but they have been recognized as sacred tenets through internal and external upheavals; through wars, panics, depressions, and the bitterest of political campaigns. They form the keystone of political liberty.

EDITORIALS IRK POSTMASTER GENERAL

The majority of the press did not see fit to go along with the President and his New Deal experiments in last year's election. Leaders of the administration admit that for the most part they have little complaint against the factual statements reported in the news columns but the thorn in the side is the editorial interpretation of the news made by the editors in a secluded section of their paper known as the editorial page.

It appears the New Dealers are no longer able to conceal their bitterness toward this editorial freedom of the press. Their rash is breaking into the open as evidenced by Postmaster General-National Democratic Chairman Farley's recent radio statement inferring that he preferred using the radio for his speech because "it will be uncontaminated by coincident editorial comment."

Another of the outbreaks appears in the more recent action on the part of the National Labor Relations Board which has issued a dragnet subpena requiring a trade-journal editor to make complete revelation of all details concerning the writing, publishing, and circulating of an article which appeared in a regular issue of the publication criticizing the Labor Relations Board.

A still further disturbing report is the headline appearing in the current issue of a weekly newspaper published in my own State of Michigan indicating the Department of Justice has been asked by someone here in Washington to investigate that newspaper.

And on the fourth front we find the Treasury Department discriminating against the newspapers of the country in a national advertising campaign in which full-page, paid-for advertisements are run in the current issues of a number of weekly magazines on the authorization of the Treasury.

FREE PRESS AND DICTATORSHIP WILL NOT MIX

Dictatorships do not flourish under freedom of the press. When the sandman of dictatorship attempts to close the eyes of the Nation with propaganda prior to his attempt to seize the reins of the United States Government, it will be the press, and only a "free" press, that will tear the veil from his face and disclose him in his true form. When that day comes the press will be the Paul Revere of the new revolution. The people, having thus had their interest aroused, will investigate for themselves. Then they will act according to the dictates of their own conscience. One-man rule and dictatorships are no longer bogeymen. They are flesh and blood in the world today. And they have walked into being as nations slumbered. A free press and free speech in America are our only sentinels against it happening here.

I am in accord with the Postmaster General when he refers to the great benefits accrued in the development of the radio.

It has been a real asset to the farm folk of our Nation who are unable to have the morning newspaper with their breakfast.

It is a real boon to our churches in reaching the multitudes who do not attend religious services.

It is proving a real factor in enlightening our Nation in the fields of education, drama, science, music, and government.

It has done much to bring our 48 States closer together.

But I am in distinct disagreement with the National Democratic chairman when he stated in his radio broadcast of November 8, this year, that "if it were not for this new agency of communication the public mind would inevitably be confused."

In making this remark he was leading up to his statement that the radio pleased him because through it his address that was to follow would be "uncontaminated by coincident editorial comment."

IS THIS UNDECLARED WAR ON PRESS?

When a Cabinet member speaks it is news. When the national chairman of one of our political parties speaks, that is likewise news. It is even greater news when the person speaking is both Cabinet member and national chairman of the party in power. And when this news source begins to tell the public about "editorial contamination," and discriminate and voice preference for one method of disseminating his news over another, it is time to take an inventory of what is happening.

As national chairman, are his remarks to imply that the Democratic Party will resort wholly to radio in its campaigns of 1938 and 1940?

As a Cabinet member, does his statement mean his administration is about to start an undeclared war on the press unless newspapers change the tone and hue of the editorial page?

Fortunately the press is not easily frightened. It does not look to the Government for favors.

Until the administration furnishes a radio for every home and so regiments its citizens that they be required to devote a certain and definite period each day to listening to a fireside chat from Washington, any movement to minimize the place of the press in the life of the Nation will fall far short of its aim.

Mr. Farley seems to have overlooked the fact that radio, though it may boast to the contrary, has its editorial writers of the air in the form of commentators who endeavor to "interpret" the news in their broadcasts. Not the least important of these is ex-New Dealer Gen. Hugh Johnson. The names of others are familiar to every radio listener in America, and they do no more than the unidentified writer of newspaper editorials whose name rarely gets before the public.

The advantage is that Mr. Farley's address, or that of any other person, may be subjected to attack by the radio editorial commentator but the chances are that those comments will not go to the same ears nor probably to as many ears as did the address itself. Then, too, the radio editorial literally vanishes in the air once it has been "published." The newspaper editorial is more lasting. It will be bound in the whole paper by libraries, may be clipped, and preserved by some readers and read and reread by others. It is record, black on white.

Freedom of speech and freedom of the press go hand in hand. Preservation of radio's free speech is as important as maintaining the freedom of the press. The life of a free people will endure as long as newspapers with their news columns and editorial writers, and radio stations with their uncensored news flashes and their news commentators enjoy freedom of speech and press.

There is no denying that there are a few papers in existence which twist the news to fit their whims and policies, but these are in the extreme minority and few of them from a political standpoint could elect a third assistant coroner. The public cannot be fooled and it has a way of doing away with this type paper just as it has of dealing with the unscrupulous businessman. Papers of this type are the exception—not the rule. My acquaintance with editors convinces me that the great majority of them try diligently and religiously to keep their news columns free of propaganda. They take the news as it comes, regardless of newspaper policy, and they rely upon their editorial page for the expression of their own views. This fact is accepted by the public.

WHAT IS BEHIND N. L. R. B. ACTION?

Those jealous of freedom of the press will watch with interest the developments in the National Labor Relations Board's subpena of the editor of a trade journal in connection with the Weirton Steel Co. case. There may be some dispute as to the motive of the Board in demanding the editor of Mill and Factory to produce about everything imaginable in connection with his gathering, producing, and circulating his magazine article called "The True Story of Weirton." The article is reported to have been reprinted and circulated among Weirton employees. If the publishers of the article are being cited merely as printers of the circulated reprint, let the Labor Board make that plain. If the citation involves the publication of the article, which contained statements critical of the National Labor Relations Board, in the regular course of the issue of the magazine, then there will no doubt be a question involving the freedom of the press.

If the Labor Board feels that the Weirton officials exerted undue influence by distributing copies of the article among their employees, I fail to see wherein the editor or publisher of the article should be harassed and cited to appear and produce such things as records, memoranda, proofs, and notes of telephone conversations, and interviews. That should be a matter between the Labor Board and Weirton officials.

Labor has long recognized and utilized the free press. It has established its own press and says what it thinks. Irrespective of the merits of the Weirton labor dispute, labor's interest will be tied up in the trade-journal citation if it becomes an issue of freedom of the press. There is a very fine labor newspaper published in my home city and I am just as anxious to see freedom of the press maintained for that editor as I am to see it preserved for the papers in the more general news field.

From Michigan today comes the published report of a request made that the Department of Justice investigate the newspaper Social Justice founded by the Reverend Father Charles E. Coughlin and classed among those militant foes of the New Deal policies. A free press applies as much to the National Union for Social Justice as it does to a metropolitan daily. It entitles that group to have its own paper and express its own views. Are such independent papers, conscientiously devoted to expounding the principles of the organization they represent, to be harassed because they differ and criticize the administration? This phase of this case will be watched if there is foundation for the published report.

TREASURY ADVERTISES—BUT NOT WITH NEWSPAPERS

Neither can action of the Treasury Department, in tossing its head in the air and ignoring newspapers when it decided to engage in an advertising campaign, go unnoticed in view of some of these other recent developments. Full page and highly colored advertisements intended to boost the sale of United States Savings bonds appeared last week in such magazines as Liberty, Saturday Evening Post, Colliers, Time, and Literary Digest. I am advised not a single newspaper participated in this advertising program. These ads were placed by two advertising agencies, one in New York and the other in St. Louis, on the approval of Dr. James W. Bryan, Chief of the Information Section of the Division of Treasury Bonds. To my knowledge this is the first time the United States Government has ever gone in for a paid advertising campaign of this type and scope in a peacetime effort to induce the public to buy direct obligations of the Government.

Such an advertising policy does not seem consistent with good business practices in view of the fact that the newspapers have devoted thousands upon thousands of columns of space for news stories based on press releases of the

various departments of the Government. In this respect the New Deal is apparently shoving the goose that laid the golden egg out of the hennery and into the cold.

Press agentry, glorified by Barnum and perpetuated by the press contact of every circus that followed, has been made a most active part of every New Deal agency. With approximately 100 departments, bureaus, boards, and authorities of the Government maintaining on a full-time basis their divisions of information that grind out a variety of press releases, the newspaper readers are given more Government news than ever before. The present administration has dipped into the cream of American journalism in many cases to obtain some of its press chiefs. I have no desire at this time to criticize or differentiate between the types of releases sent out. That is another story. Much of the information contained in the releases is highly informative and actually constitutes news. In the great mass of press releases that leave Washington daily from these governmental press agencies, it cannot be otherwise than that some of it is actually advertising for the New Deal. One prominent writer recently said:

> Thus while the editors may condemn the New Deal in relative obscurity of their editorial pages, the New Dealers continue to sell it in the more potently opinion-making news columns.

In every major movement of the New Deal it has depended upon the newspapers of the Nation to carry the message to the citizens. Despite its growing unfriendliness, it sought and utilized the press of the land to carry out appeals in connection with the most recent unemployment census. Members of Congress recently received a letter from Unemployment Census Administrator Biggers urging them to make appeals—

> through newspaper interviews stressing the importance to the Nation of full knowledge of the extent of unemployment * * * etc.

In a booklet containing a "suggested program of action" which was sent to the "Mayors' Committee for Assisting in Unemployment Census" throughout the Nation, Administrator Biggers placed much stress on ways and means of securing newspaper publicity on the census. This is one of the most up-to-date examples of the dependence placed on the newspapers by the present administration when it has a big job to undertake.

Likewise, recent in this respect was the action on the part of the Farm Security Administration and the A. A. A. in calling the Negro newspaper editors of the Nation to Washington last Wednesday and Thursday for the purpose, according to the Agricultural Adjustment Administration's own press release, of "discussing the programs of the two organizations in relation to the Negro press and the Negro farmers."

There is nothing new in Government contacts with the press although the New Deal had expanded that field. I cite these two instances of recent date to show that although the Postmaster General turns to the radio and the Treasury spends its advertising money with the magazines, the administration is still willing to take advantage of the news columns in advancing its programs.

HAS FINGER ON AIR WAVES

The Federal Government has a closer grip on the radio stations than it has on the newspapers. The broadcasting stations must renew their licenses every 6 months. They depend entirely upon the partisan Federal Communications Commission to keep competition out of their broadcasting field. In protecting this field, the Commission indirectly protects the revenues because the stations derive their incomes from their advertising field. With the 6-months' renewal regulation there is a close relationship between the broadcasters and the administration. Then, too, alterations and improvements at the station must bear the approval of the Government. The administration has its fingers on the air waves. As yet it has not attempted to stifle free speech on the air waves but the facilities for so doing are within its reach.

The press is more independent and is more free of Government regulation. The publisher makes a sworn statement in applying for the privilege of sending his paper through the mail as second-class matter and is required to publish a statement of ownership each year. Further than that the Government has no more strings tied to the press than it has to an ordinary merchant or manufacturer. The Government does not keep competition out of his field nor does it deny use of the mails to more than one paper of the same type, in the same field, and issued at the same time of day.

How long this privilege will last depends upon the constant vigilance of the publishers themselves and upon the length of time our citizens continue to want free press and free speech. Utterly ignoring the press in an advertising campaign will not eliminate a free press. Neither would abolition of the scores of "divisions of information" for as long as the records of the Government are public, the newspapers will get the news to the people. They did it before the New Deal increased these information departments by 35 percent.

FREE PRESS BAN WILL NOT COME OPENLY

Curb on a free press will not come through these open and readily distinguishable sources. By bringing these citations to your attention I would not imply that it is time to shout "Wolf, wolf." Yet who 12 months ago would have given serious thought to the idea that the administration had in mind tampering with the Supreme Court? An administration bold enough to attempt to subordinate an independent judiciary may be considered likewise bold enough to attempt to curb a free press.

With the Nation in its present state of mind, as evidenced by the uprising against the Supreme Court packing scheme, I would hesitate to predict that anyone would be so bold as to openly propose clamping down the lid on freedom of press and freedom of speech.

There are other ways of slowly attempting to accomplish that end. Experiments may be attempted. Newspapers using wire services as a source of outside news are a part of interstate commerce. Papers delivered to subscribers beyond State borders are in interstate commerce. In some cunningly worded Federal licensing bill covering "any person, firm, or corporation" we may some day find the Government tightening control of the press. If censorship and dictatorship of the press are to come, they will come through some unguarded channel. Efforts may first be made to place a curse upon the press in the minds of the people.

The movement may come as a thief in the night and loving freedom as we do we can but watch with interest the developments on the fronts I have outlined and exercise vigilance for the perpetuation of the bright constellation referred to by Jefferson. Once the press is gagged the movements against speech and religion will form in rapid succession.

Justice for Tom Mooney

EXTENSION OF REMARKS

OF

HON. JOHN M. COFFEE

OF WASHINGTON

IN THE HOUSE OF REPRESENTATIVES

Monday, December 6, 1937

SPEECH OF DUDLEY NICHOLS TO ORGANIZED LABOR AND RELIGION IN SAN FRANCISCO, CALIF., ON OCTOBER 20, 1937

Mr. COFFEE of Washington. Mr. Speaker, in the case of Tom Mooney, certain supreme values are at stake.

Here is due process of law, absolute equality before the law of every man, denied. Here is the American ideal of justice, democracy, and the square deal, ravished. Here is the right to life, liberty, and the pursuit of happiness, openly, officially, and persistently profaned. Here is the most priceless of human values—genuine freedom of thought, of conscience, of speech, press, and assemblage, desecrated.

With these facts staring us in the face, we, a group of Representatives, sincere American citizens, have associated ourselves together. We feel that these values are too great to be dissipated by prejudice and passion. We accept the specific task of aiding to create a public will to free Mooney and Billings, and an organization designed to help make the will effective: National Committee To Enforce the Constitution of the United States and the Bill of Rights in the "Strange Case of Tom Mooney."

The people everywhere who will listen must be told the truth about Tom Mooney—his militant advocacy of international peace, his labor record, his persecutions, the horrible crime pinned upon him, his imprisonment, and his appalling, abortive struggle for justice in the California courts.

Mr. Speaker, I wish to include in the extension of remarks a speech by California's foremost citizen, a Hollywood playwright, the Honorable Dudley Nichols, in an address to organized labor and religion in San Francisco, on October 20, 1937, entitled "Justice for Tom Mooney."

The speech is as follows:

I'm glad to be here tonight, to help give Tom Mooney the voice he has been deprived of for nearly 21 years. The Committee for the Freedom of Mooney and Billings, all the labor organizations that make up that committee, all of you and the people on this platform, we are the voice of Tom Mooney. It is his indomitable spirit that works in us and compels us to proclaim against an injustice that shames not only California but all America—an injustice that was aimed at organized labor but fell upon two brave men—Mooney and Billings.

The fate of Tom Mooney shows how the forces of power, greed, and gain make war on the thing they fear most—the organization of labor. They will not find it so easy from now on under the Wagner Labor Relations Act. They will invent more subtle and cunning methods in their attempts to discredit the union of labor, by shouting "Red" at able, honest union organizers, by creating splits in the ranks of labor, by pitting company unions against real unions, by encouraging jurisdictional disputes, and by force and violence whenever they can get away with it.

Nevertheless we are coming into a new era for labor, and for that very reason we must not forget the forerunners who made this era possible. We must fight harder than ever to right the wrongs of the past.

I wonder if anyone here tonight can really be aware of what it means to spend 21 years of life in a prison. I'm sure I can't. Not really. Our imaginations won't bite that deep. Twenty-one years deprived of the simple freedom that is granted to a stray dog in the streets. It's the full span of maturity in a man—all of the energetic, creative, fun-loving, hard-working years of a man's life, the years that love activity and the appetite for living that activity brings—and peaceful sleep and a glad awakening, in the midst of a family and friends.

Perhaps if you have committed a great wrong and been justly convicted by a just society of fellowmen, it is easier to bear—for there a sense of expiation accompanies a sense of guilt in civilized man.

But when you have committed a great right, when you have worked unselfishly for the betterment of your brothers among humanity, and been unjustly accused and unjustly convicted by the forces of power, greed, and gain, I wonder if any of us would have the courage and the strength to stand it, to stand it without losing sanity of mind and body, without losing a love of our fellowmen, without hoarding up bitterness and hatred.

Mooney and Billings have. It is we who are outside prison bars who must hoard up bitterness for Tom Mooney—bitterness against corrupt, powerful interests, against crooked politics and crookeder politicians, against bought-up officials and those dealers in justice who deal with a cold deck.

It was the forces of power, greed, and gain that framed Tom Mooney—framed him because they hated him—and hated him because he was a great labor organizer, in advance of his time, who knew how to go about protecting labor against their exploitation. They knew that labor properly organized would have a voice as powerful as their own, that would weaken their money-making power, and they wouldn't stand for that kind of opposition.

They wanted Tom Mooney's life, and failing that they tried to bury him alive. But after nearly 21 years they still cannot destroy his spirit—they still cannot rub the slate clean. Even the grave could not rob Tom Mooney of his meaning. There is a black spot on the slate of California, and every thinking, honest man knows it is there—and they cannot wash it off.

Every year his voice from the living grave grows louder. It is like Poe's story of the Telltale Heart. In that story a murder was committed, and the murderer buried the body behind masonry. The wall was bricked up. It was a perfect crime. Nobody would ever discover it. The murderer must have felt that secret glee that the men who framed Mooney must have experienced when the jury brought in a verdict of guilty. But wait a minute—from behind the masonry a beating sound was heard, like the ticking of a heart. At first the murderer could just hear it. But gradually it grew louder—and louder—and he could do nothing to stop it. And finally everybody could hear it, and the wall was torn away, and the crime discovered.

Just so with Tom Mooney, they may have thought him safely buried alive. But his heart keeps beating. It grows louder every day—every time a meeting such as this is held—every morning Tom Mooney wakens in his prison. And it must finally attract the attention of the whole world, if necessary, for us to tear away those walls of injustice.

There is a saying that Truth, given a fair fight, will always win. Truth in Tom Mooney's case has not had a fair fight—but still it is going to win.

It's an old, old story—this framing and imprisoning of men who threaten corrupt power. I remember an Irish friend of mine telling me with great bitterness about Sir Roger Casement, who was executed for treason by the British. The tribunal that sentenced him revealed that Casement's diary contained shocking information pertaining to sexual perversion.

They were so shocking that even his sympathizers turned their backs on him in his last hours. But this Irish friend of mine has ascertained that Casement had spent some time in Brazil, and being a man of scholarly, scientific interest, had made copious notes pertaining to a little-known tribe of savages, and with true scientific thoroughness had also noted down their sexual habits. He intended to write a book about the tribe. Instead of that his notebook was presented as a diary of his private life. My friend had a final comment to make.

"The English," he said, "never defeat their enemies; they always disqualify them."

And the same tactics are used within nations as between them. Corrupt, powerful interests don't defeat outstanding labor leaders; they try to disqualify them. The forces of power, greed, and gain, which are completely lawless, will too frequently try to use the law—the very machinery of justice—to trap the men who threaten their power by organizing labor.

Once we realize that, once we face that unpalatable fact, we realize that you don't have to belong to any party or class to fight for victims like Tom Mooney. You don't have to be a Communist, or a Socialist, or a Democrat, or a Four Square Gospelite, or a Seventh-day Adventist to get up on your hind legs and say, "I won't stop fighting and I won't shut up until they free Mooney and Billings."

All you have to be is an American.

This great country of ours was conceived in the spirit of freedom and justice and democracy. That is a great and lofty ideal; that this is a free, just country that is to be ruled by and for the people. Not just a few people, but for all the people. Those great revolutionaries who gave this country birth wrote it all down in the Declaration of Independence and the Constitution of the United States. They said to the world: "Here is the cradle of equality, justice, and democracy; come and find life, liberty, and pursue happiness." And the world came and America grew into a great Nation.

Those are the principles which have made us great, and if we still believe in them, if we are still good Americans, we must say to ourselves: "Every time our American machinery of justice is used to commit an injustice a stone is being removed from the foundation of our country." America is like a stone tower, crowned by liberty, given height by democracy, and founded on justice.

One injustice—one stone knocked loose from the base of the tower—may not be so frightening. Ten may weaken the tower. And a hundred may bring it down.

And it is up to me—to you, to every one of us—to do everything in our power to put back the stones that are torn away. We must keep the foundation of America firm. I say that an official—whether he be a district attorney or a Governor (and I'm sorry there is a traditional bridge between those offices)—who fails to do everything in his power to correct an injustice is not being a good American.

And he is not being a good human being, because all civilized society is founded on the idea of human justice.

The real enemies of that flag are those who perpetrate injustice, those who fail to right it, and those who fail to fight it.

It is not enough to say, as some well-meaning people do, that they don't know enough about the case of Mooney and Billings to take sides with conviction. If you see smoke pouring from your neighbor's house, you are not being a good neighbor or a good citizen if you hurry past and say, "Well, there may be a fire there, but I doubt it; and anyway, I'm too busy to stop and find out."

For nearly 21 years the black smoke of injustice has been hovering over Tom Mooney's prison cell, and it is the duty of an American citizen to find out where the fire is and put it out.

That flag does not represent 3,000 miles of continent between two oceans and 48 pieces of property called States. It stands for 130,000,000 people who believe in a government of freedom, justice, and democracy—who believe that human life is more important than a bank account or a foot of ground. One of those 48 stars, called California, is not very bright tonight. It was smudged when Tom Mooney was railroaded into prison. Let us never stop until that smudge is wiped off and the star shines bright again!

The Wage and Hour Bill

EXTENSION OF REMARKS
OF
HON. EDWARD L. O'NEILL
OF NEW JERSEY
IN THE HOUSE OF REPRESENTATIVES
Monday, December 6, 1937

ARTICLE FROM THE NEWARK EVENING NEWS, DECEMBER 3, 1937

Mr. O'NEILL of New Jersey. Mr. Speaker, timely forethought in connection with the bill to fix a minimum-wage standard and maximum hours for employment is a survey recently made under the direction of the commissioner of labor for the State of New Jersey, John J. Toohey. The survey, confined in scope to women and minors employed in factories, indicates that there are nearly 50,000 in our State who are being paid from $5 to $7.99 weekly. There is no doubt in my mind that these employers are among those opposed to the enactment of the Black-Connery bill.

Mr. Edward J. Flynn, an official of the State department of labor, supervisor of the census, makes the following observation in his report:

The present state of social unrest throughout the world, becoming more evident daily, shows it is necessary that society itself, through its governmental agencies, establish some rules and take some steps to cure basic conditions that threaten its stability.

Failure of society to attempt to handle this problem can result only in irresponsible and radical organizations and developments which are dangerously apparent. I believe that public knowledge and public opinion can and will tend to cure this condition.

Well, and mildly, stated. It is with not a small degree of shame that I call the attention of the Congress to this situation in my State, but the importance of the question of a fair, living wage from both an economic and social standpoint makes it necessary to throw the light wherever the unscrupulous employer may be making his vicious contribution against enlightened progress.

The report of the survey is not taken from the monthly bulletin of the New Jersey Manufacturers Association, but from the Newark Evening News of Friday, December 3, 1937, and, under leave to extend my remarks, I include the article in full:

[From the Newark Evening News, December 3, 1937]

LESS THAN A LIVING WAGE PAID THOUSANDS IN STATE—NEW JERSEY SURVEY SCANS FACTORIES' SALARIES OF WOMEN AND MINORS AND FINDS 34,000 GET UNDER $5 WEEKLY, 292,000 BELOW $17

TRENTON: A survey of wages and working hours of women and children in small New Jersey factories revealed today an estimated 34,000 receive less than $5 weekly. Another 292,000 are paid less than $17, considered a "minimum living wage." The survey has just been completed by the minimum-wage division of the State labor department.

Edward J. Flynn, supervisor of the division, declared today the survey shows more "deplorable conditions." Many poorly paid workers, he said, are forced to accept supplemental relief or charity.

Although the minimum-wage law was passed several years ago, no funds for its enforcement were appropriated. Last year Labor Commissioner Toohey received an appropriation of $12,500 for the work. Most of this has been spent on the survey. Both Toohey and Flynn now believe they need more money to obtain enforcement.

NEEDS MORE INSPECTORS

Cooperation has been obtained from local police and from sympathizers who have volunteered information on violators of the law. To have a systematic check on violators, Flynn said the department needs more inspectors.

The survey is the first of its kind ever made in the State, Flynn said, and is one of the most complete in the country. Flynn was willing to discuss a few cases he has investigated without revealing names of the employees.

Flynn said one Morris County factory employs 83 women and minors who divided a weekly pay roll of $605. Average earnings of workers are under $7.50 weekly. On the same pay roll are 10 members of the owner's family, some of whom do no work. These 10 share a pay roll of $552, the owner and his partner receiving $100 each weekly.

NEWARK CONCERN

A Newark concern which competes with the Morris County plant has an average weekly pay roll of $14.67. Flynn said the owner of the Newark plant made enough money in recent years to retire and turn the plant over to his employees. He contends this is proof the Morris County plant should pay more.

A handkerchief factory in Passaic County has an average weekly pay roll of $9.86 and competes with a nearby factory that pays employees an average of $19.67.

Flynn says he upbraided one employer whose average pay roll was only $7.40 in a plant employing 121. Flynn says the employer said his workers "weren't worth any more."

DECLARES CURE NEEDED

Commenting on the survey, Flynn said he believes the "present state of social unrest throughout the world, becoming more evident daily, shows it is necessary that society itself, through its governmental agencies, establish some rules and take some steps to cure basic conditions that threaten its stability.

"Failure of society to attempt to handle this problem can result only in irresponsible and radical organizations and developments which are dangerously apparent. I believe that public knowledge and public opinion can and will tend to cure this condition.

"There is a minimum cost of living necessary to maintain a human being at a standard below which they become a moral and physical menace to society. Whenever any person or organization employs human beings for the purpose of making a profit on their labor and pays them less than an amount sufficient to sustain the moral and physical strength necessary to do the work expected from them, it is self-evident that society is paying at least a part of the employer's labor bill.

"It is self-evident that American industry as a whole, either through wages or taxes, is paying for maintenance of American labor. It is evident also that reputable business is paying for its own labor in wages and also paying the wages for the 'chiseling' employers by taxation and charities."

The survey covered 228,000 women and minors working in factories. Labor Department statistics show there are at least 150,000 that were not surveyed. Assuming the same pay rates prevail for the 150,000 as do for the 228,000, there are 45,300 receiving from $5 to $7.99 weekly. The total number in other pay brackets follows:

From $8 to $9.99, 42,781; $10 to $11.99, 46,259; $12 to $12.99, 26,850; $13 to $14.99, 50,604; $15 to $16.99, 48,034, bringing the total of those under $17 to 292,807.

There are 31,519 receiving from $17 to $18.99; 24,974 from $19 to $20.99; 19,085 from $21 to $24.99; and 10,431 who are paid more than $25.

Federal Bureau of Investigation Has Paid Dividends to American Taxpayers Amounting to a Return of $7 for Each Dollar Spent

EXTENSION OF REMARKS
OF
HON. JENNINGS RANDOLPH
OF WEST VIRGINIA
IN THE HOUSE OF REPRESENTATIVES
Monday, December 6, 1937

ADDRESS OF J. EDGAR HOOVER, DIRECTOR, FEDERAL BUREAU OF INVESTIGATION, UNITED STATES DEPARTMENT OF JUSTICE, DELIVERED AT NEW YORK CITY, DECEMBER 3, 1937, BEFORE THE ASSOCIATION OF LIFE INSURANCE PRESIDENTS

Mr. RANDOLPH. Mr. Speaker, a few days ago I read newspaper reports of an address by J. Edgar Hoover, Director of the Federal Bureau of Investigation, which he had delivered at New York City before the Association of Life Insurance Presidents.

Once again I was impressed by the quoted assertion of this inspiring public servant as he told his audience of the return which his organization is making to the American people.

In this instance I was of the opinion that his splendid address, Public Duty in Law Enforcement, should be read in full by both Members of Congress and the public, that I called for a copy of the speech that I might include it in the RECORD.

I do so with the feeling that I voice the almost unanimous approval of the House in sincere appreciation for this investment, which is a most profitable one to the citizens of our Republic.

PUBLIC DUTY IN LAW ENFORCEMENT

Law enforcement officers and men engaged in the business of life insurance have many things in common. Both of us attempt to insure life by saving life and we use many of the same methods, although directed in different channels. You have your scientific aids toward the preservation of life—we have our scientific methods by which we endeavor to safeguard the lives of the persons for whose protection we are in part responsible.

Your enemies are disease, accident, and violence—ours can be classified almost entirely in the latter category. You work toward your ends by education—we struggle to achieve results by the same method. However, I am sorry to say that at times we are not entirely successful. To those who pay you premiums on their life insurance, there is a personal element and a personal realization of risk which causes them to be much more receptive to your educational programs which, if followed, will enable them to live to a more mature age. Our efforts in education, however, while as thoroughly vital and while directed to the very same persons, who have an equally personal investment in the matter, all too often meet with apathy. Were it not for this widespread public indifference toward crime conditions, for a too general attitude of "let the other fellow do it," we would not be faced with the fact that the criminal army of America is composed of over 4,300,000 persons.

CRIMES ARE REPEATED

I am sure that you gentlemen have ample reason to appreciate the efficacy of statistics and the need for every available fact to guide you in your business. It may surprise you to know that in the important business of crime eradication, figures and facts and statistics are still in a rather lamentable state. It was not until the Federal Bureau of Investigation a few years ago began to gather statistics from various law-enforcement bodies throughout America that there was any picture whatever regarding the extent and fluctuation of crime. Even today those figures are incomplete, although they rapidly are assuming proportions which give us an accurate view of the conditions as they actually exist. Nevertheless, there are many necessary facts still lacking. For instance, we do not know exactly how many criminals are repeaters in crime. As gaged by fingerprints received, we know that fully 55 percent of all persons arrested have been arrested before. However, the lives of these men and women in many cases were shrouded in mystery until recent years when the growth of the Fingerprint Division of the Federal Bureau of Investigation, serving all parts of America, revealed their true identities.

There was a dearth of accurate statistics on the disposition of various cases. We found in numerous instances that a person who had been successfully masquerading as a first offender, in reality had behind him a long string of past violations. Thus you see we are only now beginning to get at the true facts regarding the extent and ramifications of crime, and the picture is truly alarming. Especially is this true in the taking of human life. You, as life-insurance men, are, I know, vitally concerned with the fact that there are roaming at large today in the United States some 200,000 potential murderers who during their lifetime will account for the deaths by violence of more than 300,000 persons, unless the present murder rate is reduced.

It should be a matter of most vital concern to know that every 40 minutes a human being is struck down in homicide. It should interest you also to realize that many of these crimes are those of degeneracy, often committed by persons afflicted with diseases which only recently have been discussed in public. Further, as persons who are interested in preventives, you should know that the slayers of the more than 13,000 persons who are our annual homicide victims are extremely blessed by the kindness of lax criminal laws, the eagerness of shrewd and often unscrupulous attorneys, and professional crime magicians, the soft-heartedness of many State parole and pardon boards, and the apathy of the public to the extent that the average murderer in the United States now spends less than 54 months in prison as the result of his crime.

CRIME IS COSTLY TO NATION

Life insurance companies have a distinct stake in the prevention of crime. Certainly murder is costly to you. The wreckage of human lives brought about by anguish and sorrow should be a consideration. When you realize that there are over 13,000 cases of murder and manslaughter each year and over 47,500 aggravated assaults, any one of which can affect later life, the problem resolves itself into one involving a distinct monetary consideration which cannot fail to be aided by the attention of such great fact-finding bodies as life-insurance companies. You have done great work in admonishing the public on the necessity for quick diagnosis and speedy treatment of numerous diseases; you have educated persons on the dangers of cancer, of tuberculosis, and of heart ailments, and within the last few years you have been courageous pathfinders in the distribution of information concerning the viciousness of our so-called social diseases. To my mind, crime is as malignant as any cancer, and it is as distinct a subject of health as tuberculosis. Both the victim of tuberculosis and the victim of the slayer may carry life insurance. Tuberculosis victims have a chance to recover. No murder victim ever again rises from his sprawled position where he has been knocked prone by the bullet from the gun of a criminal.

It might be profitable for insurance companies to take more interest in many of our jails and some of our reformatories and penitentiaries. It is a distinct matter of public health to know whether persons are being housed in unclean surroundings; whether they are being forced to remain in the same cells with other prisoners suffering from contagious diseases; whether the mentally unfit are being housed with prisoners of normal mentality, and whether unfit persons are being released to again prey upon the public.

It should be your consideration that law-enforcement agencies be given every benefit of proper public support, proper appropriation and assistance. By proper law enforcement, the public may survive; without it you may be sure that you will pay more insurance and indemnities.

MUST LOOK TO CAUSES

Reverting again for a moment to the matter of prisons and jails, a survey would reveal some appalling facts regarding the number of degenerates who are often improperly incarcerated in surroundings where they can spread their degeneracy to others and thus increase their menace, or who are released improperly, or improperly sentenced, or not removed, as they should be, from communion with our daily life. The surprising increase of degenerate sex crimes within the last few years has revealed an urgent necessity for corrective action by every public-minded body. This is not wholly a problem of law enforcement. In many cases, as you well know, degeneracy can be traced to disease, mental or physical. There should be given to the cure of degeneracy the same thought, the same eager perseverance, the same persistent investigation that has resulted in the lessening of many other dangerous diseases.

Naturally, the results of degeneracy, taking form in numerous crimes, fall into the hands of the law-enforcement officer; however, the causes of degeneracy are things for other persons to inquire into and to seek the cure, and until a program for the suppression and prevention of the causes of sex crimes can be found, we shall continue to see our women assaulted and our children brutally murdered. Law enforcement can apprehend the murderer. Law enforcement, however, cannot prevent the development of the factors which led to that murder. This is a job for the doctor, for the scientist, for the psychiatrist, and for great investigative, public-minded bodies like the life insurance companies of America.

And since we are talking of public duty, it might be well for us to look into some other facts which are just coming to light. There is no doubt that poverty is a factor which contributes to crime, but it is not the sole cause. Poverty, it is true, is the cause of many convictions, for the poor criminal has not the aid of shrewd lawyers or of venal political or other improper influence which may sway the scales of justice. But we find that most of the major criminals are not poverty stricken, particularly when one considers that some of our notorious bank robbers have often rolled up an annual income of $100,000. The reason in all these cases is quite simple—the more money a person has, the more friends one has; the more ability one has to summon influence to his assistance in times of stress, the more one is inclined to believe that he can get away with it when he commits a crime.

Let us consider the case of the average citizen. He overparks his automobile or he commits a traffic violation. He is summoned into traffic court. Immediately he begins a campaign to outwit the law. In one instance that I recall a man who had committed a violation involving a $2 fine spent $50 on everything from influence to plain bribery so that he might have the satisfaction, as he called it, of outwitting the police officer who gave him a ticket. I submit that if otherwise reputable citizens feel that they have a right to fix one form of violation, they cannot very well complain about the criminal who believes in his right to hire a shyster lawyer or to bribe a jury in order to get out of a pentientiary sentence for having committed a murder. Crime will continue to increase until public sentiment crushes crime, and public sentiment cannot crush crime until a public consciousness is aroused against all forms of crime.

PETTY CRIME COMES FIRST

You gentlemen of life insurance have spent much money in advertising to acquaint people with the tiny causes of great diseases. You have made it a self-apparent fact that many of the things which take our lives are invisible to the eye. The same thing is true of the desperate crime which menaces us today, in which over 1,300,000 major infractions are committed each year, in which there is a robbery every 10 minutes, a burglary every 2 minutes, a larceny every 44 seconds, and a case of automobile theft every 2½ minutes. It is rare indeed that a major criminal starts as such. He begins in a petty way, often with pilfering and other minor violations, finally to feed upon society until he reaches the status of a public menace. When we trace his history, we find that in his boyhood, the cause of his early crimes often was parental laziness, lack of discipline, and failure to set the proper example. The boy who hears his father boast of how he fooled the police in a traffic violation should not be held solely responsible if he too decides that it is smart to outwit the law.

American crime begins in the American home. The only way it can be cured is by a reestablishment of respect for law by the heads of our homes. In this regard, I want to remind you that more than 18 percent of all our crime is being committed by youths of 21 years or less. Moreover, during the first 9 months of 1937, persons under 21 years of age committed 13 percent of our murders, 28 percent of our robberies, 41 percent of our burglaries, and 51 percent of all automobile thefts. They did not learn their disrespect for law in our schools. They did not learn it at the grocery store or at the drug store or in church. They learned it at home. They learned it from parents who took pride in the exploits of rats like Dillinger or "Pretty Boy" Floyd, and who exulted in the freeing of a murderer because this murderer happened to have an attorney

more shrewd than the State prosecutor. They gained their disrespect from parents who in many instances were themselves addicted to petty or greater violations of the law.

Since we have been on the subject of values, monetary and otherwise, it might be interesting to look at the record of what proper public support can do toward law enforcement. It has been the happy privilege of the Federal Bureau of Investigation to have the good will and the support of honest citizens everywhere, which led to the proper appropriations and to the ability to build a scientific investigative body on the highest possible standard. The Federal Bureau of Investigation is naturally proud of many accomplishments. We realize that the results obtained could not have been accomplished without enthusiastic aid from the public and other law-enforcement agencies. Because of that support and because of that assistance there were 15,777 violators of Federal laws convicted during the last 4 years in cases coming within the investigative jurisdiction of the Federal Bureau of Investigation. Out of every 100 persons who have been charged with violating Federal laws by special agents of the Federal Bureau of Investigation and taken to trial, 94 have been convicted. During this period the cost of operating the Federal Bureau of Investigation amounted to a little more than $18,000,000. During the same period, because this Bureau has been allowed to build itself into an efficient organization, it was able to return in savings, in fines imposed in cases investigated, and in recoveries of stolen goods, a total of more than $135,000,000 to the taxpayers of America, or more than $116,000,000 above what it cost to operate the Bureau. In other words, this Bureau has paid dividends to the taxpayers amounting to a return of over $7 for each dollar spent, which I believe is one of the most profitable investments, public or private, that the American people possess.

REAL RETURNS ARE MADE

I cite these figures, not only because I am proud of them, but because I am extremely grieved that every community in America is not realizing the maximum returns from its law enforcement. I hasten to add that law enforcement of itself is not at fault. The responsibility for the lack of profitable enforcement in so many of our communities again goes right back to your insurance policy holders—the people of the average American home. If they only could be made to see that it is their business and problem and danger and protection, I feel sure they would be more determined that law enforcement everywhere be raised to a standard of high efficiency and profitable accomplishment. Once that is done, I assure you, crime will decrease automatically, because once the American home can be made to work for law enforcement it will of itself breed respect for the majesty of our laws. Without this, no matter how hard honest men of law enforcement seek to combat it, crime will continue to flourish.

We recently have heard from self-styled experts on criminology, men who believe they know even more than all law enforcement, that crime is definitely on the decrease. Unfortunately, crime is not decreasing and criminals are not reforming. The records of the Federal Bureau of Investigation show that crime is increasing; that more murders, manslaughters, robberies, sex crimes, burglaries, and automobile thefts were committed during the first 9 months of 1937 than during the same period last year.

I deplore the misinformation, the haphazard ideas, the scrambled suggestions, and silly sentimentality of these persons who attempt to cure crime by textbook methods. You cannot wipe out murder, nor arson, nor rape, nor any other crime by coddling criminals. It must be done by the methods of experienced men who know their business, who actually deal with criminals, who from long years spent in tracking down crime and watching methods of those who commit it, have been able to draw up a line of attack which can implant upon the criminal mind the fact that he cannot violate our laws and get away with it.

No criminal who is given the belief that he will be treated with kid gloves, sent to prisons often operated as country clubs, where he has the benefits of loafing, sun baths, radio, daily newspapers, magazines, motion pictures, baseball, basketball, and football, to remain there only so long as he desires to rest up from his criminal activities, and then leave on an easily obtained pardon or parole, ever can be persuaded that crime is anything but a highly enjoyable business. Only swift and sure and determined detection and apprehension, plus equally swift and sure prosecution, adequate sentences, discipline in prison, and a proper release without political or monetary influence, followed by strict supervision, can make any criminal realize that there is majesty in law, and power in the sentence of a judge when he punishes him for his crime.

PAROLE SYSTEM IS WEAK

This naturally leads me to a discussion of the administration of our State parole systems in America. You have heard much of it. You have heard many of our sob sisters relate at length about how few persons ever are returned for violation of parole. Whether these people speak the badly distorted facts which they so easily utter from ignorance or from a studied effort to delude the American people, I do not know. But the fact is that there is at the present time an apparent and persistent effort on the part of numerous self-styled know-it-alls to delude the people into believing that the administration of parole is a success. This is not true. Parole administration as it exists in all too many of our States is not a success. It is a failure. And it is trampled under foot by thousands of paroled convicts who look upon it as a part of their right. I am not speaking from any standpoint of fanciful theory. I speak from the hard and bitter experience of a man who has seen several of his associates shot down by the guns of members of the underworld who had been the recipients of clemency; shot down by such rats as "Baby Face" Nelson, who was three times paroled; by such vermin as Alfred Power, who walked out of a prison by the parole route by adopting an English accent and thus securing his release for deportation.

Moreover, I speak for every police and other law enforcement agency in America which has seen its brave officers go to their duty to be murdered, often from ambush, by paroled convicts. I hope I speak for every mother, who in the horror of grief, has gone trembling to the city morgue to look upon the defiled, broken body of some innocent child, raped and tortured by some sex-crazed monster who himself left prison by the parole method. These are the grounds upon which I speak. And I speak in defense of every decent American who wants his home protected. I am fighting against the cloud of misinformation, the smoke-screen that is being thrown up, why I do not know, to protect murderers, thieves, thugs, brigands, desperadoes, and outlaws.

When the records of the Federal Bureau of Investigation show that 55 percent of all criminals arrested have been previously arrested for other crimes and when the records also show that approximately 50 percent of all prisoners now are being released on parole, how do the professional parole advocates manage to make anyone believe that hardly anyone ever violates a parole?

Why are these people so much interested in glossing over the vicious parole abuses which exist in so many of our States? Why do they disregard the fact that 30 percent of the 13,519 dangerous criminals listed in the Federal Bureau of Investigation's single fingerprint file as the country's most desperate kidnapers, racketeers, hoodlums, bank robbers, and extortioners show a record of having been the recipients of parole or other types of clemency not only once, but in many cases as often as 4, 5, 6, 7, 8, 9, and 10 times?

There is not an experienced law-enforcement man in America who is not harassed by this parole problem; yet these officers who risk their lives in protecting our homes are ridiculed by these advocates of easy freedom who want us to open the doors of every penitentiary to almost anyone who wants liberty. Have you ever heard from any parole advocate, from any one of these professional regenerators, one logical reason why old-time offenders, persons with long, vicious criminal records, should be turned loose on parole, time and time again? They do not answer that question. They twist the subject, they squirm about, they throw out smoke screens to make you believe that all persons who object to the abuses of parole are monsters who want to keep all first offenders in prison. They try to make you believe that the complaints against the maladministration of parole are directed against the first offender and not against the persons whom these parole purveyors are really trying to get out of prisons—the old-timers, the vicious criminals, the professional bank robbers, the multiple murderers. They are the ones who get out under many of the State parole systems as they exist today.

CITIZEN HAS OBLIGATION

No one ever hears any criticism of the Federal parole system and the workings of the Federal Parole Board. The reason is a simple one—the Federal system works. The Federal Parole Board, under the able guidance of Attorney General Homer Cummings, efficiently and honestly tries to free the fellow who deserves to be turned loose and keep in prison the man who should remain there in the interest of society. Any parole board which follows that system will meet with the approval of law-enforcement officers everywhere. But when prisoners are turned loose indiscriminately and when individuals who either disguise the facts or are ignorant of the facts seek to make prison merely a stopping place on the way to new crimes, then not only every law-enforcement officer, but every honest citizen should rise in persistent protest until such a condition is corrected.

There is no fault whatever to find with any parole system that honestly releases a first offender after he has served a definite period of time and then closely supervises his activities in a proper way after his release so that he may remake himself into a respectable citizen. No efficient law-enforcement officer anywhere ever uttered one word against the legitimate use of parole, against the true theory of parole, against the efficient administration of parole as it really is intended to be—that of regenerating the first offender. What we law-enforcement officials object to and what I, for one, will continue to combat is the interference of venal politics, of improper influence, of excessive sentimentality, which opens prison doors to confirmed offenders, and which sends them out to multiply our taxes, multiply our sorrows, multiply our anguish, and multiply greatly the dangers which we must face from an ever-rising multitude of criminals. If we are to insure life we must also save life, and if we are to insure property we must protect property. For this reason I have tried to present some of the obstacles which we are confronted with daily on the battle front of law enforcement. Because of your positions as leaders in a great humanitarian movement, looking toward a better society in the future, we look to you as our allies. And as such, we must stand united in combating lawlessness, which is one of America's most dangerous, most subversive, and most destructive diseases. May we fight it to the absolute limit!

The Farm Bill

EXTENSION OF REMARKS
OF
HON. GEORGE H. MAHON
OF TEXAS
IN THE HOUSE OF REPRESENTATIVES
Monday, December 6, 1937

ARTICLE FROM THE CORPUS CHRISTI (TEX.) CALLER, OCTOBER 26, 1937

Mr. MAHON of Texas. Mr. Speaker, under the leave to extend my remarks in the RECORD, I include the following newspaper article appearing in the Corpus Christi Caller concerning the views of my distinguished colleague, the gentleman from Texas [Mr. KLEBERG] with reference to farm legislation:

[From the Corpus Christi (Tex.) Caller, October 26, 1937]

FARM LEGISLATION'S IMPORTANCE STRESSED BY KLEBERG WHO SAYS NEW COTTON USES NEEDED

It is essential that careful consideration be given to the agricultural problem by the Congress of the United States as agriculture in general is the most important stone in the foundation of the Nation's credit, Congressman RICHARD M. KLEBERG declared here yesterday.

"No more grievous thing, in my opinion, could occur than to pass poorly considered legislation which might affect farmers and agriculture detrimentally," the Congressman said.

KLEBERG, accompanied by Sam H. Johnson, his secretary, will leave by motorcar early this morning for Washington, where the Congressman, Member of the House Agriculture Committee, will be busy for the next 2 weeks working on the new farm bill which will be presented to the special session of the Congress. Congress is to be convened November 15 in special session at the call of the President.

Johnson returned here last night from Johnson City and Austin, where he was called by the illness and death of his father.

KLEBERG, who has had a hand in the formulation of all farm legislation in recent years, is particularly perturbed over the farm problem as it affects cotton farmers of South Texas and his district. The picture, he said, is different today than it was in 1929 when first consideration was given to cotton farm legislation. In 1929 foreign mills depended 40 percent on American cotton, where today they depend on us for only 15 percent of our cotton as a result of increased foreign production. Fifteen percent cannot affect the world price as 40 percent did a few years ago.

"Our solution of the farm problem in the Congress," he said, "will depend on what we can work out through the various compromises which are necessary to all legislation.

"One interesting thing to me is the comparison between the success of the soil-conservation program on cotton prices in 1936 as against cotton prices under the same conservation program in 1937."

Farmers in this section, according to KLEBERG, may recall a speech he made in February of 1936 at a meeting attended by representative farmers from over the district and when he made the recommendation, which resulted from an agreement with the Department of Agriculture, that a grower, in order to be eligible for benefits under the Soil Conservation Act, should divert from cotton and soil-depleting crops from 25 to 35 percent of acreage then and now known as base acreage. For the 1937 program, however, the Department changed its recommendation with reference to diversion, requiring from 1- to 35-percent diversion.

"I feel reasonably certain," he said, "that the excess production in Texas and other cotton States was largely due this year to the reduction and diversion recommended by the Department.

"I'm equally certain that this was by no means the major factor in difficulties which confront us today. The increase in world production through increase in foreign production has, of course, to a major degree created the present excessive surplus. I can't help but feel that the ever-normal-granary idea, as applied to cotton, will find its major obstacle to success in the fact that whenever cotton is stored in quantity, either here or elsewhere, its effect on market continues to be felt as long as it is in existence in unprocessed form. I'm candid to say that our major problem in solving the difficult situation involved in giving the cotton farmer a reasonable livelihood in return for his effort is to be found in a combination of greater improvement in ways and means of distribution and sale of our cotton, together with extensive and effective research looking to new uses and greater utilization and disposition of our cotton."

Foreign warfare creates an entirely new aspect and adds to the difficulties involved in trying to solve the American farm problem, he pointed out, emphasizing that we can expect a great reduction in purchase and use of American cotton in Japan and China during the war in China. Both countries formerly have been good markets for our cotton which went into clothing and industrial uses. How much of the loss may be taken up by use of cotton for war materials is, at best, a matter of conjecture and will be affected materially by recent neutrality laws. The situation in Spain also affects us in the same way, although not so extensively.

"The major influence on legislative action is to be found in the Nation-wide and world-wide importance of cotton as a factor affecting the financial, social, and industrial phases of the general picture. Cotton plays a most important part as a taxpayer and as a means of furnishing employment. In 1935, for instance, we found approximately 40 percent of all gainfully employed people in all American industry to be employed by industries using cotton as a part of manufactured output. This percent did not include those employed in the production and harvesting of cotton nor in ginning preparation for sale in its divided forms.

"In its financial aspect the earning power of cotton fields of the South plays an important part in the foundation of the credit structure of the Nation, as it affects Federal, State, and county fiscal affairs in the southern cotton-producing States. The earning power of cotton-production areas must by all means be kept on a proper level with its valuation for taxable purposes as collateral for debt. In this conection agriculture generally is the most important stone in the foundation of credit of the United States, both Government and private credit. For this reason it is essential that careful consideration be given to the agriculture problem by the Congress.

"After all is said and done, more depends on farmers' ability to produce and on their prosperity than upon any other class under our flag. The truth of this statement is to be found in the immediate recent past. We, the American people, should not expect too quick results from the effect of legislation on a picture which has so many aspects and angles.

"The farm problem, in truth, is the problem of the ages, but it is my belief that American genius and brains, under our present form of representative government, where the voice of every American may be heard, will find a quicker solution, if any is to be found, than could be secured in any other country."

The Congressman declared it will be his purpose to "do my dead level best as the Representative of the Fourteenth District" during the session.

The Agricultural Committee of the House of Representatives was called to meet October 27 in Washington by Chairman MARVIN JONES, of Amarillo. Congressman JONES paid tribute to KLEBERG'S work on the committee in his letter, as follows:

"May I take this occasion to express to you my personal appreciation for the fine work you have done in connection with legislation pertaining to agriculture.

"The farmers of your district, as well as the country in general, should feel very grateful to you for the splendid contribution you have made."

Alameda Airplane Base Is Fixed Where Navy Wished

EXTENSION OF REMARKS
OF
HON. JOHN J. McGRATH
OF CALIFORNIA
IN THE HOUSE OF REPRESENTATIVES
Monday, December 6, 1937

EDITORIAL FROM THE SAN FRANCISCO CHRONICLE, NOVEMBER 29, 1937, AND A LETTER IN REPLY THERETO BY HON. JOHN J. McGRATH, OF CALIFORNIA, TO GEORGE T. CAMERON, PUBLISHER

Mr. McGRATH. Mr. Speaker, in accordance with the permission granted to me to extend my remarks, I am including herein an editorial which appeared in the San Francisco (Calif.) Chronicle, on November 29, 1937, under the headline "Alameda Airplane Base Is Fixed Where Navy Wished", and a letter in reply thereto written by me to Mr. George T. Cameron, publisher of the San Francisco Chronicle.

EDITORIAL FROM THE SAN FRANCISCO CHRONICLE

On Friday the Government handed a dollar to the city of Alameda and took in return complete title to the lands where the Navy will at once begin building its $15,000,000 seaplane base.

This ceremony, and the start of the work, came considerably later than might have been the case. This is due to the pull and haul by self-seeking politicians ever since the Navy settled on Alameda as the place where it wanted its base and the monkey wrenches they from time to time tossed into the works.

Representative JOHN J. MCGRATH of the Eighth District was the chief troublemaker. After the bay communities had pledged themselves to support whatever site the Navy chose, and the Navy had announced its choice of Alameda, Mr. MCGRATH stepped in.

Pursuing the art of palavering his constituents, he stirred up San Mateo County with a declaration of "inside knowledge" that the Navy did not want Alameda and that he could bring the base to the San Mateo shore. Flatly contradicted in that by a telegram from the Secretary of the Navy, Mr. McGRATH, in pique, declared he would kill the base if it could not be obtained for San Mateo.

He did make a good deal of trouble and delayed the beginning of this vast bay area project. Labor and every interest that has been held back from this business can thank him for the long delay. But that is all he did and his constituents in the Eighth District should now have a clear idea of his performance as their Representative.

The Navy has likewise decided on a site at Oakland for its equally important supply base. That, too, is now a target for self-seeking politicians. Representative McGRATH has promised to tear that up by the roots and move it to one or another of various points on the San Mateo and Santa Clara bay shore. Other publicity seekers are palavering their constituents in the same way. Mr. McGRATH has succeeded in delaying this $15,000,000 project. It was his maneuvering that stopped it in the last session of Congress so that this vast amount of expenditure for labor and materials in the bay area is still held up.

But in the end the outcome will be exactly the same as with the Alameda seaplane base. There will come a day, one or two or three or four or five years later than it might come if it were not for the monkey-wrench business, when the Navy will hand over its dollar, take title to the Oakland site, and begin building its supply base there, where it wants it, because it thinks that is the best place.

All that these misrepresentatives will have succeeded in doing will have been to shut the bay area out for some unnecessary period of time from the benefits of the spending of $15,000,000 for labor and materials.

LETTER FROM HON. JOHN M'GRATH, OF CALIFORNIA, TO GEORGE T. CAMERON, PUBLISHER OF THE SAN FRANCISCO CHRONICLE

DECEMBER 3, 1937.

Mr. GEORGE T. CAMERON,
Publisher, The San Francisco Chronicle,
San Francisco, Calif.

DEAR SIR: Your editorials making personal attacks upon me seem invariably to be printed at times when you are certain that I am not in California, and your editorial headed Alameda Airplane Base is Fixed Where Navy Wished, printed on November 29, 1937, is an excellent example of your tactics.

I suppose that I should be delighted to receive the attention of a once great newspaper, and I also assume that my answer to your editorial will—if published at all—be buried in your "safety valve." However, this particular editorial is so completely filled with misstatements that I am answering it and also making it my business to see that my reply is not buried under the twin peaks of yellow journalism and pink cement.

You make the deliberate charge that I have maliciously delayed the final acceptance of the Alameda airplane base site. You know that, while I believed that there were other sites on the San Francisco side of the bay which merited consideration, when the Navy finally decided upon the Alameda site I voted for the authorization bill in the Naval Affairs Committee and that I also voted for the measure when it came before the House of Representatives. If you had lacked accurate information on these points you could have secured the truth from Congressman ALBERT CARTER, who represented Alameda before the committee.

You also know that the only cause for any delay in the acceptance of the Alameda site was due to the fact that Alameda was—until November 26—unable to furnish title to the property.

Apparently in your judgment it is high treason for anyone to desire anything good for San Francisco and for the San Francisco peninsula.

You obviously intended in this editorial to deceive the people of San Francisco and of the peninsula by stating that I am attempting to secure the naval supply base for a site "on the San Mateo and Santa Clara bay shore." While it is true that there are several excellent sites in northern San Mateo County having the necessary qualifications of deep water and adequate rail and highway facilities, you know that the State Harbor Commission has offered free of charge to the Navy Department one of the finest sites ever presented for a naval shore establishment, and you also know that that site for which I am demanding consideration is located in the city and county of San Francisco. You also know that that site is receiving the support of both of the Congressmen representing the city and county of San Francisco, and that it has been endorsed by Mayor Rossi and the San Francisco board of supervisors. You also know that the San Francisco Civic League of Improvement Clubs and Associations is actively working for that site. You also know that every chamber of commerce in San Mateo County has united with San Francisco in presenting this site to the Navy.

The Assistant Secretary of the Navy, Mr. Charles Edison, has officially stated that no decision as to a site for the supply base will be made until all available sites have been fairly and fully considered.

As a member of the Naval Affairs Committee, I have insisted, and I shall continue to insist, that the excellent sites on the San Francisco side of the bay be adequately and honestly presented to the Navy Department. In making this fight I am properly representing my district; I am protecting the public interest which has a right to expect a real national defense and returns for its naval investment. At the same time I am representing the laboring men and the business interests of San Francisco and of the peninsula in bringing to them the additional employment and industrial benefits which will necessarily flow from the establishment of this important naval base.

Almost all of the people of San Mateo County are directly connected with the economic life of the city of San Francisco. Whatever benefits San Francisco benefits us, and whatever benefits the San Francisco peninsula is of direct value to the city of San Francisco; our interests are one.

Your opposition furnishes additional proof that I am right, and I am pleased to advise you that I shall continue my cooperation with those who truly represent our metropolitan area in working for a better San Francisco peninsula community.

Congratulating you upon your consistency in betraying the interests of San Francisco and in selling it not "down the river" but "across the bay," I remain,

Very truly,

JOHN J. McGRATH,
Member of Congress.

Regarding H. O. L. C. Foreclosures

EXTENSION OF REMARKS
OF
HON. JOHN M. HOUSTON
OF KANSAS
IN THE HOUSE OF REPRESENTATIVES

Monday, December 6, 1937

Mr. HOUSTON. Mr. Speaker, a great amount of pressure has recently been put on Congressmen for enactment of H. R. 6092, introduced by Mr. ELLENBOGEN, which provides for the extension of periods of amortization of Home Owners' Loan Corporation loans from 15 to 25 years and reduces interest rates to 3½ percent, both provisions retroactive.

A request was made to Mr. John W. Childress, of the H. O. L. C., for a statement on the Corporation's foreclosure procedure and policy, data on foreclosures, and opinion as to the effect of the Ellenbogen bill, if enacted, and for the benefit of those interested, I give a résumé of his reply.

During the 3 years authorized by Congress for the refinancing operations of the H. O. L. C., which ended June 12, 1936, the Corporation refinanced a total of 1,018,413 loans involving $3,092,840,081. Through September 1937, the Corporation had authorized 116,994 foreclosures, of which 8,531 were later withdrawn, leaving a net figure of 108,463. Of these foreclosures, the total carried to conclusion, bought in by the Corporation and now held for liquidation, is 58,189.

The number of foreclosures thus far authorized represents 10.7 percent of the number of loans made. While this sounds like a large number, the actual percentage of foreclosed loans is little, if any, in excess of the normal percentage of delinquency among private agencies and much less than the percentage of these agencies when there is taken into consideration the fact that all of the Corporation's mortgages were distress loans, where the borrower was, in practically every case, totally delinquent, with an accumulation of taxes, interest, and so forth, which made his case hopeless. Only through the intervention of the H. O. L. C. was the distressed home owner given a fresh start and so assisted to preserve his home.

The reasons for foreclosure are analyzed and represent approximately the following: Twenty percent because the property has been abandoned, or virtually so; 20 percent for obstinate refusal to pay by those able to do so; 5 percent due to death of the borrower and other legal complications; 55 percent because of the noncooperation of the borrower in making the proper effort to take care of his obligation to the Corporation. Only where the case seems hopeless for one of the above reasons is foreclosure started.

In regard to interest rates, Mr. Childress states that after a study of many hundreds of foreclosure cases which have passed over his desk he has come across no instance of a

foreclosure which might have been averted by a lower interest rate. The monthly payment on the average Corporation loan of $3,028 at the present rate of 5 percent is $24.04. If the rate were reduced to 3 percent, the monthly payment would be cut by only $3, to $21.04, and the reduction would represent a very insignificant part of the total of any delinquency which would justify foreclosure action by the Corporation.

The corporation maintains there is a serious social and ethical question of changing the rate of interest at this late date on H. O. L. C. bonds which have been purchased by the public or taken in exchange for mortgages by former mortgagees upon the basis of their present interest rates, and with the knowledge that they are secured by first mortgages upon individual homes, bearing 5 percent interest.

It is believed few realize the enormous cost of the detail of changing more than 1,000,000 mortgages either as to interest or time payment. Every note and mortgage would have to be recast and reexecuted, the expense of which alone would run into many millions of dollars. Based upon a cost per loan of only $50 for new title, new papers, recording, etc., this estimated expense would run to more than $50,000,000.

No one can predict with any decree of certainty what Congress will do with the Ellenbogen bill; but if in the meantime any borrower from the H. O. L. C., threatened with foreclosure, residing in the Fifth District of Kansas and desirous of making a sincere and conscientious effort to liquidate the loan, will write to me and give details of his or her case, I will be glad to take the matter up with Mr. Childress, who has always manifested a helpful and sympathetic attitude in cases of this kind which I have reported to him, in an effort to effect a fair and satisfactory adjustment.

The Silver Lining

EXTENSION OF REMARKS

OF

HON. EVERETT M. DIRKSEN

OF ILLINOIS

IN THE HOUSE OF REPRESENTATIVES

Monday, December 6, 1937

Mr. DIRKSEN. Mr. Speaker, "Every cloud has a silver lining," sang the melody makers of yesteryear. Wrong again. There is one cloud without a silver lining and, oddly enough, it is the silver cloud. It is lined with financial headaches. The question is to the fore again, because our silver agreement with seven foreign nations and our domestic program of buying newly mined domestic silver will expire on December 31. Virtually every economist of any note has proclaimed the need for an immediate repeal of the present silver policy and it will be interesting to see what recommendation will be made with respect to silver.

I recall the whimsical contentions of the silverites back in 1934 when they argued so earnestly that if the silver-purchase bill were enacted into law, providing purchase of silver until it amounted to one-fourth of our gold stock or reached $1.29 per ounce, it would dispel our economic problems, set world trade in motion, and give a sterling-silver lining to every troublous cloud. Where are these advocates of the white metal today.

They promised that the purchase of silver would restore our trade with China and Mexico. Instead it chased China off silver and to a managed currency and caused Mexico to complain to the State Department. They said it would bring prosperity to the Western States. The per capita relief cost in those Western States has been higher than in other States of the Union. They said it would raise price levels. It may have done so but oddly enough, one of the most pesky problems now is to get the price level down. They saw almost immediate achievement of a price of $1.29 per ounce for silver. After 4 fantastic years, during which nearly one and four-tenths billion ounces were purchased, the world price is still 45 cents or about one-half cent above what it was before we purchased this astronomical quantity of silver.

When the Silver Purchase Act became law, it was estimated that one and one-third billion ounces would have to be purchased to bring about a ratio of 1 to 3 with gold. We have actually purchased 65,000,000 more ounces than that amount and still have more than one and two-thirds billion ounces to go to make goal. It takes 28 percent more silver to bring about that ratio than when we began purchases in June of 1934. Can anyone think of a single reason why such a futile law should be kept on the statute books and why we should subsidize the handful of western silver miners to the tune of 32 cents an ounce for newly mined silver? If it be argued that it is a form of relief subsidy for the miners, the answer is that we could buy for every silver miner in the country a nice new bungalow, give him a lifetime pension and save a barrel of money for the taxpayers of the land. From the taxpayers standpoint, this silver issue is important because the expenditure made to purchase silver in the hope of effecting the ratio of 1 to 3 are adding to the interest-bearing debt of the Nation. In addition, this expansion of the currency has an inflationary effect which is no doubt in part reflected by higher price levels. This silver fiasco means something more to taxpayers than fillings for teeth or household cutlery. It means higher prices, higher taxes, and economic instability.

The State Allotment of Cotton

EXTENSION OF REMARKS

OF

HON. ORVILLE ZIMMERMAN

OF MISSOURI

IN THE HOUSE OF REPRESENTATIVES

Monday, December 6, 1937

Mr. ZIMMERMAN. Mr. Speaker, if the bill now under consideration by this Committee (H. R. 8505) is passed in its present form, a great injustice will be done to the cotton growers of southeast Missouri. It so happens, Mr. Speaker, that practically all of the cotton grown in the State of Missouri is grown in eight counties in the extreme southeast portion of the State, and these counties comprise the greater part of the Tenth Congressional District, which I have the honor to represent.

Under the original cotton program, Missouri was given a State allotment of only 200,000 bales, an allotment wholly inadequate to the needs of our cotton growers, and this allotment was made because of the Johnson amendment, which, at the instance of our very able Senator, Hon. BENNETT CHAMP CLARK, made provision for the cotton growers of Missouri as well as for those of California. Throughout this program Missouri was grossly discriminated against and was never able to market a fair quota of cotton commensurate with her capacity to produce cotton. Our cotton growers, realizing the danger of this same injustice being done to them under the pending bill, assembled in a mass meeting at New Madrid, Mo., on last Thursday, December 2, 1937, and unanimously adopted the following resolution, which was placed in my hands:

Whereas any cotton control program is unsound that does not consider the most profitable method and localities for production of cotton, and

Whereas there has been and still is a very large migration of cotton farmers from the poor hill sections of other Southern States to southeast Missouri, and

Whereas the increase in acreage and production in southeast Missouri in the last 5 years are definite proof of economic trends in cotton production: Therefore be it

Resolved, That we favor cotton-crop control, provided:

(1) That under any program adopted, an adequate quota nationally both in acreage and pounds, be allotted to each State. By an adequate quota is meant for each State an acreage equal to the 1937 planted acreage in cotton, plus diverted acreage under the 1937 program.

(2) That each county's allotments be assigned on the above basis.

(3) That county and local committees be given proper authority to assign and adjust individual bases within the county on most equitable basis, good farming practices and present trends being considered; and be it further

Resolved, That copies of these resolutions be sent to our Congressmen and Senators.

Until the last 2 or 3 years a very limited acreage of cotton was planted and grown in these eight counties in the Tenth Congressional District. In the last 2 years many thousands of acres have been placed in production by cotton growers and planters who have come to our section from Alabama, Mississippi, Tennessee, Arkansas, and have bought farms, and, without help or assistance from anyone, they have built homes, cleared land, and are actively engaged in the production of cotton. In addition to carrying the investment they have made in these lands, they are required to pay heavy drainage assessments, and, unless they are permitted to participate fairly in any farm program adopted by this House, they face financial ruin, the loss of their labor and money invested.

This bill makes ample provision for an adequate allotment to the several counties in our State and to the farms in these counties, but our whole trouble comes from the lack of an adequate State allotment. If the average 5-year period is adhered to in making the allotment to our State, our allotment will be far below the percentage received in other States. In other States where cotton is grown extensively all over a State, the new lands coming into production would not seriously cut down the State allotment. However, in Missouri, where a very limited acreage has been grown in cotton over the years, the large acreage of new land put in production over the last 1 or 2 years, would greatly reduce our State allotment when derived from a 5-year average, taking into consideration new and old lands.

Mr. Speaker, unless fair and due consideration is given to these new lands, the cotton growers of our State will be in a far worse situation than they are today under the present program. Under the bill as it now stands, the only factor that may be considered by the Secretary in making this State allotment is "trends in acreage during the applicable period." I submit that the Secretary of Agriculture could do most anything and defend his position under these very general terms. During the crop year 1937 we had a large yield in every section of the country, and a large acreage planted to cotton. I submit that this acreage would be a fair basis from which to figure our State allotment, not only for our State, but for every State engaged in cotton production. If the State allotment is figured on this basis, Missouri, like other cotton States, will have a fair opportunity to produce cotton; all that we ask from anyone.

Further Observations on H. R. 7710, a Bill To Provide Shorter Hours for Firemen in the District of Columbia

EXTENSION OF REMARKS

OF

HON. ROSS A. COLLINS

OF MISSISSIPPI

IN THE HOUSE OF REPRESENTATIVES

Monday, December 6, 1937

Mr. COLLINS. Mr. Speaker, there appear, on page 2248 in the Appendix of the RECORD, Seventy-fifth Congress, first session, remarks made by me on the bill H. R. 7710, entitled "A bill to provide shorter hours of duty for members of the fire department of the District of Columbia." Since that time I have received additional data on this measure. This data is in the form of two tables, the first giving a comparison of the hours of duty, sick and annual leave in 25 of the larger cities, and the second showing the salaries paid firemen in 25 of the larger cities. In each comparison it will be noted that the situation in the District of Columbia at the present time compares very favorably with the other cities on the list. The tables referred to are set forth below as follows:

Hours of duty, sick and annual leave, in fire departments of 25 large cities of the United States

City	Hours of duty per day	Hours of duty per week	Annual leave with pay	Sick leave with pay
Los Angeles, Calif.	12	78	15	Injury, line of duty, 1 year; sick, 14 days; 16 days, 65 percent.
San Francisco, Calif.	12	72	14	Injury, line of duty, indefinite; sick, 6 months.
Chicago, Ill.	12	72	20	1 year.
Indianapolis, Ind.	12	72	15	Indefinite.
Louisville, Ky.	12	84	10	13 weeks.
New Orleans, La.	12	84	15	Injury, line of duty, indefinite; sick, 1 year.
Baltimore, Md.	12	84	14–16	Injury, line of duty, 1 year; sick, 6 months.
Boston, Mass.	12	69	14	Injury, line of duty, indefinite; sick, half pay for 30 days.
Detroit, Mich.	12	72	20	Injury, line of duty, indefinite; sick, 60 days.
Minneapolis, Minn.	12	78	15	Up to 90 days.
Kansas City, Mo.	12	84	21	1 year.
St. Louis, Mo.	12	84	15–20	Injury, line of duty, indefinite; sick, 90 days.
Jersey City, N. J.	12	84	15–18	1 year.
Newark, N. J.	12	84	15–18	Do
Buffalo, N. Y.	12	74	15	Injury, line of duty, 1 year; sick, 6 months.
New York, N. Y.[1]	12	84	21–30	Indefinite.
Rochester, N. Y.	12	78	15–20	Injury, line of duty, indefinite; sick, 6 months.
Cincinnati, Ohio	12	84	15	1 year.
Cleveland, Ohio	12	84	14	Injury, line of duty, indefinite; sick, 1 year.
Toledo, Ohio	8	48	14	1 year.
Philadelphia, Pa.	12	72	14	Injury, line of duty, indefinite; sick, according to nature of illness, half or full pay.
Pittsburgh, Pa.	12	78	14	Injury, line of duty, indefinite; sick, none.
Seattle, Wash.	12	72	15	Injury, line of duty, half pay for 6 months; sick, first 3 days deducted.
Milwaukee, Wis.	12	84	14	1 year.
District of Columbia	12	72	26	Injury or illness, line of duty, indefinite; other, 30 days.

[1] Now working into 3 platoon system—8-hour day, 56-hour week.

Salaries paid privates in fire departments in 25 of the larger cities of the United States as of January 1937

City	Extrance	Maximum
Philadelphia, Pa.	$1,820	$2,184
Detroit, Mich.	2,520	2,520
Los Angeles, Calif.	2,040	2,280
Cleveland, Ohio	1,800	2,420
St. Louis, Mo.	1,680	2,160
Baltimore, Md.	1,600	1,800
Boston, Mass.	1,600	2,100
San Francisco, Calif.	2,160	2,400
Pittsburgh, Pa.	1,650	2,100
Buffalo, N. Y.	1,808	2,663
Washington, D. C.	1,900	2,400
Milwaukee, Wis.	2,040	2,280
Minneapolis, Minn.	1,680	2,160
Cincinnati, Ohio	1,500	1,860
New Orleans, La.	1,642	1,642
Kansas City, Mo.	1,460	1,620
Newark, N. J.	2,100	2,500
Seattle, Wash.	1,920	2,160
Louisville, Ky.	1,351	1,540
Indianapolis, Ind.	1,819	1,819
Rochester, N. Y.	2,100	2,100
Denver, Colo.	1,740	1,920
Houston, Tex.	1,656	1,656
Portland, Oreg.	1,763	2,009
Toledo, Ohio	1,500	1,800

Monopoly Under the Milk Trust

EXTENSION OF REMARKS
OF
HON. FRANCIS D. CULKIN
OF NEW YORK
IN THE HOUSE OF REPRESENTATIVES
Monday, December 6, 1937

LETTER OF THE PRESIDENT TO HON. FRANCIS D. CULKIN, REPRESENTATIVE, FROM NEW YORK

Mr. CULKIN. Mr. Speaker, last week I placed in the RECORD in connection with my discussion of the monopoly now enjoyed by the Milk Trust in the marketing of dairy products a letter to the President calling his attention to a recent report of the Federal Trade Commission. I am in receipt of an interesting, and courteous response to that letter, and to preserve the amenities of the situation, I am including the full text thereof in the RECORD at this point.

THE WHITE HOUSE,
Washington (on board U. S. S. "Potomac"),
December 4, 1937.

Hon. FRANCIS D. CULKIN,
House of Representatives, Washington, D. C.

MY DEAR MR. CULKIN: I have your letter of November 22, referring to my letter to Chairman Ayres of the Federal Trade Commission, requesting an investigation into the high cost of living; in connection with which you call attention to a recent report of the Commission entitled, "Agricultural Income Inquiry," and with respect to the findings therein you make certain comments.

At the time I made this request of the Commission, I was aware that such an investigation had been made. It, however, deals primarily with farm products and, insofar as such commodities are concerned, contains data pertinent to the general subject covered in my letter. There are many other commodities entering into the cost of living concerning which information is also desired.

You will note from a careful consideration of the Commission's report and the conclusions and recommendations based thereon, copies of which were transmitted to both Houses of Congress under date of March 2, 1937, that where in various industries, a high degree of monopolistic control appears to be present, it is to a large extent believed to be the result of certain weaknesses in the law, the strengthening of which has been recommended to the Congress at various times by the Commission.

A copy of this report by the Commission has been furnished to the Secretary of Agriculture and a copy, so I am informed, also has been transmitted to the Department of Justice for its information and consideration in connection with the enforcement of the antitrust laws.

Very sincerely yours,

FRANKLIN D. ROOSEVELT.

The House will notice that the President agrees that there is a high degree of monopolistic control in the marketing of farm commodities but that the law needs strengthening in certain particulars. The fact is that the appellate courts have at various times punched holes in the antitrust legislation. I do not say this in criticism of the courts, as the statutes in question were so drawn as to be difficult or impossible of interpretation.

I assume the legislation the President refers to will come in in January, and I urge the committees having charge to beware of jokers and ambiguities. I am confident both sides of the aisle will be for this legislation so that America will again become a land of equal opportunity.

May I state that I am greatly encouraged at the attitude of the Attorney General, Mr. Cummings, on this question. I read his speech delivered before the Associated Grocery Manufacturers of America on this question, and his stand is most encouraging. If he will do as good a job on the food racketeers as he did on the gangsters and yeggs, he will have made some history. After all, the food racketeers and the yeggs are blood brothers under the skin. I have confidence in Mr. Cummings, and believe we are in for a period of real law enforcement of the Antitrust Act.

The Congress should bear in mind that adequate appropriations are necessary to fight these racketeering combines. I bespeak for the Attorney General generous appropriations to this end.

Civil-Service Reform—Sham or Real

EXTENSION OF REMARKS
OF
HON. ROBERT L. BACON
OF NEW YORK
IN THE HOUSE OF REPRESENTATIVES
Wednesday, December 1, 1937

Mr. BACON. Mr. Speaker, many people seem to despair of getting good, decent, civil-service reform, and in their desperation are willing to take the Ramspeck bill as something better than nothing.

It is particularly appropriate that the record be kept straight at this time, especially in view of the fact that the Senate, after many, many months, seems likely to take some action on the proposal to place postmasters of the first, second, and third classes under the civil service. That the Senate Committee will accept the philosophy of my own bill, or even the "better-than-nothing" Ramspeck bill, appears a forlorn hope.

The fight for real civil-service reform will go on. But it is vitally necessary that real civil-service reformers not permit themselves to be maneuvered into a compromise which will defeat their long-sought objective and which may put off for a long time the victory that is still possible during this Congress.

Let us see how the National Civil Service Reform League reacts to the various proposals that have been put before the present Congress on the subject of bringing postmasters of the first, second, and third classes under the civil service.

I have discussed the whole situation with the secretary of the National Civil Service Reform League, and as part of my remarks I am going to include the correspondence I have had with him.

On May 2, 1936, I received the following letter from Mr. H. Eliot Kaplan, executive secretary of the National Civil Service Reform League, asking my opinion of the so-called Ramspeck bill:

NATIONAL CIVIL SERVICE REFORM LEAGUE,
New York City, May 2, 1936.

Hon. ROBERT L. BACON,
House of Representatives, Washington, D. C.

DEAR SIR: There has been so much conflicting opinion as to the general attitude in Congress on the Ramspeck postmastership bill that we are asking the Members of the House to be good enough to indicate whether they approve or disapprove of the measure. A copy of the Ramspeck bill, which has been favorably reported by the Committee on the Post Office and Post Roads, is enclosed.

We should appreciate your filling out and mailing to us the enclosed card. We are not asking you to sign your name. Our purpose is merely to have the consensus of the Members of Congress regarding the inclusion of Presidential postmasters under the Civil Service Act.

Very truly yours,

H. ELIOT KAPLAN,
Executive Secretary.

THE RAMSPECK BILL

My reply to Mr. Kaplan, under date of May 6, 1936, gave my position fully on this "better-than-nothing" bill as follows:

MAY 6, 1936.

Mr. H. ELIOT KAPLAN,
National Civil Service Reform League,
521 Fifth Avenue, New York, N. Y.

DEAR MR. KAPLAN: The Ramspeck bill cannot command the serious attention of any informed supporter of the merit system. It is pure political camouflage, adroitly framed for campaign effect. Under the guise of civil-service reform, it would deal a deathblow to the last pretense of merit administration in the Post Office Department.

President Roosevelt, Postmaster General Farley, and every other key man in our new spoils regime have undertaken to broadcast the impression that the Ramspeck bill would take postmaster appointments out of politics. But I, for one, do not intend that this shameless camouflage shall obscure the New Deal's crimes against civil service since 1933. Mr. Roosevelt has added more than 250,000 persons to the full-time Federal pay roll without increasing the civil-service list.

In a word, the Ramspeck bill is not at all what it is represented to be; it is a spoilsmen's bill in civil-service dress. Friends of

merit should not confuse the substance of the matter with the form.

The Ramspeck bill is worded very cleverly—framed, it appears, with a primary view to confusing public opinion on an issue which the New Deal no longer can evade. The bill provides, in section I, that all postmasters of the first, second, and third classes shall be appointed under the Civil Service Act. This is what the New Dealers would like the country to believe the bill would accomplish.

But section II specifically entrenches the spoils system. It provides that, at the expiration of present terms, appointments in these classes "shall be made by reappointment and classification, noncompetitively, of the incumbent postmaster * * *."

This language embodies precisely the antithesis of merit principles. It would enable the Postmaster General, in effect, to reappoint any incumbent postmaster for a life term, without a competitive test of any sort. It would enable Mr. Farley to "freeze" incumbent postmasters into a Nation-wide political oligarchy. For you have noted, of course, that section I of the bill provides that these postmasters "shall hereafter be appointed without term." The net effect of the bill, therefore, would be to abolish the present 4-year term and place the appointive power on a noncompetitive basis exclusively in the hands of the Postmaster General.

In the event the Postmaster General elected not to reappoint the incumbent at the expiration of the present term, his alternative would be to fill the place "by promotion or transfer from within the Postal Service in accordance with the provisions of the Civil Service Act and rules * * *." But attached to this language is a sweeping proviso empowering the Postmaster General to certify to the Civil Service Commission at will "that there is no qualified person serving in the vacancy office available for such promotion or transfer." This would be the most sweeping spoils power ever placed in the hands of any Cabinet officer—and yet this legislation is attempted under the guise of bolstering the merit system.

Furthermore, you will note that in section III the Ramspeck bill specifically authorizes continuance of the present deplorable system of appointing "acting postmasters." This is the device which Postmaster General Farley has used with such conspicuous success in evading the provisions of the existing civil-service law relating to postmasters in the first three classes.

At present the "acting postmaster" always is appointed on purely political considerations. In the course of a few months the Civil Service Commission holds its nominal examinations to prepare a list of three ranking eligible applicants. But in this rating the factor of "experience and training" weighs 80 percent in the appraisal of the candidates. Thus, the man who has been serving 6 months as "acting postmaster" has an 80-percent head start on all his competitors. This is how the system has worked under Farley since 1933, and the provisions of the Ramspeck bill, as embodied in section III, would legalize the "acting postmaster" racket for all time.

In a word, the Ramspeck bill is a public fraud. It is designed to place the whole post office permanently in the hands of the presently entrenched political spoilsmen. It would submerge the Mail Service so deeply in partisan politics that reform would be hopelessly blocked for perhaps a quarter of a century.

On the whole, this measure is only another illustration of the New Deal's empty lip service to merit. The spoilsmen of this administration do not dare defend their personnel policies, conduct, or record. They seek only to cover their crimes against our 50-year-old civil service with fake legislation. They recognize well, as the recent national newspaper poll indicated, that 90 percent of the American people favor civil service. Thus they seek to constantly advance the Roosevelt spoils system by putting a merit tag on their successive measures of civil-service corruption.

The purpose of civil-service law is to place Government employment on a career basis. Any measure sincerely aimed in that direction will command my vigorous support. I insist, however, that any bill offered in the name of civil-service reform shall be genuine. I do not intend to be taken in by any such fraud as the Ramspeck bill, the Logan bill, or the Mead bill. Nor do I intend to be silent on such bills merely because their sponsors call them civil-service measures.

No such campaign device for sugar coating the shameful record of New Deal spoilsmanship ever can command more than the indignant opposition of all true friends of merit. The New Deal has ravaged civil service as has no other administration during the last half century. This crime against the public service cannot now be covered with the white garments of vacuous civil-service reform.

As I see it, this cringing confession by the administration is even more revolting to the American sense of justice and square dealing than the crime itself.

Every major act of the Roosevelt administration has been a dagger thrust at the heart of civil service. Yet the New Deal spoilsmen have not the temerity to state their policy boldly and follow through. Instead, they walk timidly behind the skirts of civil service.

I should like to see the New Deal spoilsmen unmasked, and perhaps the Ramspeck bill may be the vehicle to bring this whole sordid picture into the focus of national attention.

Sincerely yours,

ROBERT L. BACON.

On May 15, 1936, Mr. Kaplan, commenting on my criticism of the Ramspeck bill, wrote me:

NATIONAL CIVIL SERVICE REFORM LEAGUE,
New York City, May 15, 1936.

Hon. ROBERT L. BACON,
House of Representatives, Washington, D. C.

MY DEAR CONGRESSMAN BACON: Thank you for your letter of May 14 in answer to my suggestion regarding a bill to place the Works Progress Administration under the Civil Service Act. I am glad to know that you are willing to introduce such a bill.

Under separate cover I am sending you a copy of the pamphlet we have just issued which was mentioned in the press, and some others which may be of use to you. I enclose a list of magazine articles on the merit system in government published during the last 2 years, some of which may contain material worth referring to in the speech you contemplate.

In answer to your letter of May 6 regarding the Ramspeck postmastership bill:

I cannot share your views that the Ramspeck bill "would deal a deathblow to the last pretense of merit administration in the Post Office Department," although I realize that the bill is far from perfect from a merit system point of view. Of the many bills to place Presidential postmasters under the Civil Service Act which have been introduced in the present Congress, the Ramspeck bill is not the one which the league would have chosen. We would much prefer a bill like the Vandenberg bill (S. 320) which would really take politics out of the post office; but as a practical matter, we realize that a bill of this sort has absolutely no chance of passage under either a Democratic or Republican administration.

The league drafted a postmastership bill which was introduced in successive Congresses for many years—on the last occasion by Mr. LEA, of California, during the Hoover administration. It received absolutely no consideration, because it would have required incumbent postmasters when their terms expired to compete with outsiders in order to hold their positions. Neither party is willing to have their politically appointed postmasters put at such a disadvantage.

So far as the provision permitting the Postmaster General to certify to the Civil Service Commission "that there is no qualified person * * * available for such promotion or transfer" is concerned, I cannot agree with you that "this would be the most sweeping spoils power ever placed in the hands of any Cabinet officer." The heads of Departments in the entire Federal service now have the right to call for an examination open to outsiders when a vacancy occurs; they are not required to promote or transfer a person already in the Department. The permission granted the Postmaster General by this section is no departure from the practice sanctioned by the Civil Service Act and rules.

Section III does not continue the present system of appointing acting postmasters, which you justly call "deplorable," but requires that acting postmasters shall be hereafter appointed in accordance with the provisions of the civil-service rules governing temporary appointments. This would change the system which now permits acting postmasters to serve indefinitely, and with no opportunity for the Civil Service Commission to intervene. It would put acting postmasters on a par with all other temporary employees, who may be appointed only upon prior authorization of the Civil Service Commission pending certification from an eligible list, and may serve no longer than 30 days after certification of the list to the Department without the Commission's approval.

It would require the connivance of an unscrupulous Civil Service Commission in order to "legalize the 'acting postmaster' racket" under this section; and even granted such connivance by a possible future Commission, it would be open to inspection by interested organizations, employes, and citizens as any other gross violation of the civil-service law. At present, however, there is no redress possible.

As I said above, I realize that the Ramspeck bill has glaring faults, but I firmly believe that even considering these, its passage would be a step far in advance of the present system. History proves that "covering in" politically appointed incumbents of positions which are added to the classified service is the price which has always had to be paid for the extension of the merit system. More than 8,000 positions were so treated by President Harrison, over 35,000 by Cleveland and almost 18,000 by Theodore Roosevelt, with a gain to the merit system as the long-term result. A memorandum sent me 3 years ago by a "career" employee of long service with the Civil Service Commission states:

"It early became the established practice of the Civil Service Commission to accept the inclusion of incumbents with their positions without examination. The great advances of the merit system under the administration of the Commission have been accomplished by cooperation with the Departments, and not by force. The consent of Departments to the inclusion of groups of positions under the civil-service rules has doubtless often been based, impliedly at least, on the Department's understanding that the incumbents would be included with their positions. * * * With the rapid changes in personnel which occur in normal times, it is comparatively a short time before the ill effect, if any, of such inclusions disappears."

As a matter of fact, I know of only one act of Congress which required incumbents to undergo competitive examinations when their positions were put in the classified service. This was, of course, the Prohibition Enforcement Unit, which had become notoriously corrupt, in the public estimation.

There is a simple way by which the appointment of postmasters could be actually placed upon a nonpolitical basis, more quickly

and more effectively than by any of the bills which have been introduced for this ostensible purpose. This is by an executive order of the President, invoking the rule followed by President Wilson that the first man on every eligible list for postmaster be appointed. This rule was unfortunately altered by President Harding soon after his inauguration for the system which has since been followed, permitting the choice by the Postmaster General of one out of three. If it were known that appointments were to be made in strict numerical order, according to earned ratings in the examination, the major source of dissatisfaction would be done away with. We have urged President Roosevelt to issue such an order, but to no avail.

Sincerely yours,

H. ELIOT KAPLAN, *Executive Secretary.*

THE BACON BILL

On May 22, 1936, I again addressed Mr. Kaplan, sending him a copy of a bill I had introduced to bring postmasters of the first, second, and third classes under a real merit system. My letter is as follows:

MAY 22, 1936.

Mr. H. ELIOT KAPLAN,
Executive Secretary, National Civil Service Reform League,
521 Fifth Avenue, New York.

MY DEAR MR. KAPLAN: I am attaching herewith a copy of a bill I have introduced today, designed to bring all postmasters of the first, second, and third classes into the civil-service system.

This bill eliminates the objectionable spoils features of the Ramspeck bill, which I outlined in my letter of May 6.

You will note that we would establish a permanent career service for postmasters in these three classes. However, we do not propose to "blanket" the Farley political postmasters into the civil service for life terms. This measure provides that, at the expiration of his present term, every incumbent postmaster must qualify under civil-service rules and regulations, if he is to retain his post for an indeterminate appointment. This seems to me to be the essence of the merit system—competitive examinations at the start and full civil-service protection afterward to all who qualify for appointment. This, as I read the Ramspeck bill, is not provided in the administration proposal.

Moreover, our bill specifically provides, in section 1, that "no recommendation by any Senator or Member of the House of Representatives, or any political endorsement or recommendation of any kind, shall be received or considered in making any appointment or promotion under this act * * *."

Section 2 makes it mandatory that postmasters shall be appointed wherever possible "by promotion of persons within the Postal Service * * *." Here, as I see it, is the very heart of the merit system—that persons serving faithfully in the ranks shall be eligible to promotion to the highest executive positions in the Postal Service.

In section 3 we provide that postmasters may be selected outside of the Service only upon showing by the Department that no one in the Service is qualified for advancement. This provision differs fundamentally from the Ramspeck bill. By that measure the Postmaster General would be authorized to certify at will that no qualified candidates were available in the vacancy office. Our bill, on the other hand, provides for such certification only upon showing that ambitious postal employees were unable to qualify under the established civil-service rules.

We further provide in section 3 that when the Postmaster General does not select the first name on the eligible register furnished by the Civil Service Commission, he "shall certify to the Commission his reasons for not so doing, which reasons may be made public."

Our bill next provides that no appointment as acting postmaster may be made save in accordance with the provisions of the existing civil-service laws governing temporary appointments. This section would eliminate the worst evils of the acting-postmaster system so vigorously pursued by the Post Office Department since 1933.

To further assure the elimination of political considerations, our bill provides, in section 5, that "it shall be unlawful for any Senator or Member of the House of Representatives to make any recommendation of any person for appointment or promotion as postmaster."

I quite agree with the sentiment expressed in your letter of May 15 that the evils of the present system of postmaster appointments could easily be overcome by Presidential Executive order by putting the Postal Service on an efficient merit basis. But since there apparently is no disposition on the part of the administration to attack the problem in this effective way, the next recourse is to legislation.

If the administration wishes to fulfill its many pledges and promises for the protection and advancement of the merit system, here is a short and simple measure aimed at the very core of the problem in the Postal Service. If the administration will take up this bill—or any bill aimed at the same objectives—the legislation could be brought before the House of Representatives under a special rule and passed within 48 hours.

If, on the other hand, the administration is determined to persist in the policy of political spoils and civil-service raids—as I believe it is—then this bill which I have introduced will never see the light of day in this session of Congress.

The administration's failure to act, however, will again demonstrate the utter insincerity of the many repeated pledges by President Roosevelt concerning his hopes for civil-service advance during his administration.

If the civil service is to be saved, some measure of this sort ultimately must be passed.

I see no valid reason why the beginning should not be made in the remaining days of this session of Congress.

Sincerely,

ROBERT L. BACON.

The bill introduced by me—reintroduced since as H. R. 3129, first session, Seventy-fifth Congress—is as follows:

Be it enacted, etc., That postmasters of the first, second, and third classes, or of any other classes hereafter established, shall hereafter be appointed, without term, by the Postmaster General in accordance with the provisions of this act and the Civil Service Act of January 16, 1883 (22 Stat. 430): *Provided*, That no recommendation by any Senator or Member of the House of Representatives, or political endorsement or recommendation of any kind, shall be received or considered in making any appointment or promotion under this act: *Provided further*, That postmasters now serving may continue to serve until the end of their terms, but they shall not acquire classified civil-service status at the expiration of such terms of office.

SEC. 2. The Postmaster General shall make appointments of postmasters by promotion of persons within the Postal Service possessing such qualifications as may be approved by the Civil Service Commission.

SEC. 3. If no persons are able to qualify for appointment by promotion under the provisions of section 2, the Postmaster General shall request the Civil Service Commission to hold an open competitive examination under the provisions of the Civil Service Act and rules. In the event the Postmaster General does not select the first name on the eligible register furnished him by the Civil Service Commission he shall certify to the Commission his reasons for not so doing, which reasons may be made public.

SEC. 4. That all appointments of acting postmasters at offices of all classes shall be made in accordance with the provisions of the civil-service rules governing temporary appointments.

SEC. 5. That it shall be unlawful for any Senator or Member of the House of Representatives to make any recommendation of any person for appointment or promotion as postmaster.

Mr. Speaker, I invite comparison of my bill with the provisions of the so-called "better-than-nothing" Ramspeck bill, which I now quote:

Be it enacted, etc., That postmasters of the first, second, and third classes shall hereafter be appointed without term, by the Postmaster General, in accordance with the provisions of the act entitled "An act to regulate and improve the civil service of the United States," approved January 16, 1883: *Provided*, That postmasters now serving who have satisfactory records shall continue to serve until their 4-year terms of office expire, after which they may be reappointed without term in accordance with the provisions of section 2 of this act.

SEC. 2. Appointments to positions of postmaster at first-, second-, and third-class post offices shall be made by the reappointment and classification, noncompetitively, of the incumbent postmaster, or by promotion from within the Postal Service in accordance with the provisions of the Civil Service Act and rules, unless the Postmaster General certifies to the United States Civil Service Commission that there is no qualified person serving in the vacancy office available for such promotion. No person shall be eligible for appointment under this section unless such person has actually resided within the delivery of the office to which he is appointed, or within the city or town where the same is situated for 1 year next preceding the date of such appointment, if the appointment is made without competitive examination; or for 1 year preceding the date fixed for the close of receipt of applications for examination, if the appointment is made after competitive examination.

SEC. 3. Appointments of acting postmasters in all classes of post offices shall be made in accordance with the provisions of the civil-service rules governing temporary appointments.

SEC. 4. All acts or parts of acts inconsistent herewith are hereby repealed.

At the time of the consideration of the Ramspeck bill in the House of Representatives, efforts were made to substitute my bill for the administration measure, but with no success. The last chance came under the parliamentary rules, when a motion to recommit the Ramspeck bill was in order. I offered my bill as a motion to recommit; or, in other words, to have the Ramspeck bill recommitted to the Civil Service Committee of the House with instructions to substitute the provisions of my bill and have it brought immediately before the House for a vote. My motion was defeated.

But long before the Ramspeck measure was acted on by the House, it was generally acknowledged that that measure fell far short of real civil-service reform and that it was, in effect, "a spoilsmen's bill in civil-service dress."

I want particularly to call attention to what the National Civil Service Reform League has to say of the measure introduced and sponsored by me, known as H. R. 3129, in comparison with the so-called "better-than-nothing" Ramspeck bill, and therefore I include herewith a letter received from Mr. Kaplan, the secretary of the league, dated June 1, 1936, as follows:

NATIONAL CIVIL SERVICE REFORM LEAGUE,
New York City, June 1, 1916.

Hon. ROBERT L. BACON,
House of Representatives, Washington, D. C.

MY DEAR CONGRESSMAN BACON: I would certainly prefer seeing your new bill in regard to appointments of postmasters adopted than the pending Ramspeck bill. I am grateful to you for your letter of May 22, in which you explain at length the purposes of your bill.

Your proposal approaches as nearly the ideal as one could hope for, but I wonder if there is really any chance for its adoption by either a Democratic or a Republican Congress. I suppose as a civil-service reformer I should not be particularly concerned with the practicalities or realities of the situation, but strive to get the best bill adopted by Congress and oppose any halfway measure.

On the other hand, my experience with legislatures has made me a practical person. I should like to see the ideal system adopted. We know, however, that seldom do we get the ideal law. I, of course, do not mean to imply by this that one should approve a halfway measure and abandon the more ideal plan just because the practical thing is to get the former bill through. I have no illusions that even the Ramspeck bill will be adopted at this session. Nor would I weep copious tears if it should not be and there were some possibility of your bill receiving real consideration by the Congress.

That the league approves of your bill goes without saying. Its own proposal some years ago sought to accomplish the same purpose that your bill is designed to do. I like particularly your provision in section 3 requiring the Postmaster General, when he selects other than the first name on the list, to certify to the Commission his reasons for not appointing the first person; and, even more so, the provision in section 5 precluding any Member of Congress from making any recommendation for any person for appointment or promotion as postmaster.

I am all for your new bill and will continue to pray for its adoption. It is something worth striving for. I shall urge our friends and supporters to give the bill the backing it deserves.

Sincerely yours,

H. ELIOT KAPLAN, *Secretary.*

Mr. Speaker, there is the record; and still available to us is the opportunity to enact during this Congress a measure worthy of our efforts—a bill that will bring real and not sham civil-service reform.

The issue is clear-cut; either we will have a continuance of the patronage system or the inauguration of a real merit system; there can be no satisfactory compromise.

To my Democratic friends I throw out this reminder: With an overwhelming majority in both the House and the Senate, and the oft-repeated pledges of President Roosevelt, if there be failure to enact a real merit bill the country will not fail properly to fix the responsibility.

Federal Aid for Highway Construction

EXTENSION OF REMARKS
OF
HON. NOAH M. MASON
OF ILLINOIS
IN THE HOUSE OF REPRESENTATIVES
Monday, December 6, 1937

Mr. MASON. Mr. Speaker and Members of Congress: I disagree with the President's move to balance the Budget by recommending that Congress lop off a sum of $214,000,000 from the annual appropriation for Federal aid in the construction of highways. I contend that this move would single out the 29,000,000 automobile owners to bear the brunt of the first step in this Budget-balancing effort. The Federal Government collects $320,000,000 each year from the automobile owners of America, in special taxes on gas, tires, oil, and other excise taxes; $214,000,000 of this huge sum is now being returned each year to the several States for road-building purposes—a direct benefit to the motorists. The balance of the sum is being diverted to other channels.

I claim it is unwise to stop assistance to the States in their road-building programs, because these Government dollars, or, in reality, motorist dollars, spent for building roads represent more value received, more wages for American workmen, and a better investment for the future than Government dollars spent in almost any other way. It can truthfully be stated that road-building appropriations, more than any other appropriations, are quickly and unfailingly converted into material benefits. First, there is the ultimate product, the paved roads, that have been surely and permanently lifting America out of the mud; and second, the American workingmen receive 91 cents in actual wages out of each dollar spent for road building. The Government dollar spent for roads accomplishes more real good than when spent in almost any other way. This plan of Government spending is particularly desirable at this time when unemployment rolls are mounting again and human suffering is in the offing.

A member of the opposition is criticized when he finds fault without offering an alternative. I, therefore, offer as an alternative plan the suggestion that the administration get rid of some 300,000 useless employees—excess baggage—that have been added to the Federal pay roll during the last 3 or 4 years. Such a step would accomplish more toward balancing the Budget than the President's recommendation that Federal aid for road building be greatly curtailed. It would bring about a saving of approximately $400,000,000, an item worth considering even in these extravagant times. I claim we should make a start toward balancing the Budget by first eliminating all unnecessary and useless expenses of the Federal Government.

History Repeats Itself—Jackson and Roosevelt—Jackson Takes the Offensive—Ten-Point Program

EXTENSION OF REMARKS
OF
HON. MAURY MAVERICK
OF TEXAS
IN THE HOUSE OF REPRESENTATIVES
Friday, December 3, 1937

RADIO ADDRESS BY HON. MAURY MAVERICK, MEMBER OF CONGRESS, FRIDAY, DECEMBER 3, 1937, 7:30 P. M. (EASTERN STANDARD TIME), C. B. S. NETWORK (STATION WJSV), WASHINGTON, D. C.

Mr. MAVERICK. Mr. Speaker, by unanimous consent, I include herewith a speech delivered as of this date, December 3, 1937. Something, in my opinion, must be done to stop the propaganda that all we have to do is to knock taxes off big business, and that millions of men will be put back to work.

Our situation is very complicated and there is plenty for Congress to do. My address was as follows:

Friends and fellow Americans, about 2 weeks ago I made a radio talk and told of the confusion in Washington. Now there is somewhat less confusion with important legislation being considered, but the two forces are still here: One, those who wish to destroy the President and all progressive government by any means; and two, those who are still with the President. When we came back this session the prevailing propaganda was to give up every gain we have made, let big business and the big speculators go on gobbling up little business, knock the higher brackets of taxation off those who are best able to pay, making, of course, small business bear the burden, and above all, make the same mistake all over again which was made by the Government last spring, by laying more people off Government work and the W. P. A.

ANALYSIS OF PRESENT SITUATION

In a situation like this, it is necessary for us to think for ourselves. So let us analyze the situation closely:

First. Throughout the ages prosperity has never been brought about by taking the taxes off the rich and clamping them on the poor. But it is also historically true that people have frequently been fooled and intimidated to such an extent that they have even fought wars and shed their blood against their own interests. This time, let us stand pat; let burdens be borne according to capacity to pay.

But today, and second, if our memories are not too short, think of the condition of banks and business 4 or 5 years ago. Just a few months ago, a little bank went broke in my district near San Antonio. With the recent Government guaranty of bank deposits, all depositors were paid off in a few days, and a new bank started. What would have happened in the old days? You know. But that is only one of the dozens of laws, meaning security and good government to you, passed during the Roosevelt administration.

Third. Speaking of Presidents—nearly all the Presidents who really had the courage to stand by the people were cursed and damned and accused of ruining business. And Roosevelt is cursed the most bitterly and loudly because, although through his leadership wealth and the capitalistic system were saved, it was through his leadership that more has been done for the American people than by any other President.

BE INDEPENDENT! THEY MEAN DEPENDENT ON REACTIONARIES

There comes a time when one should speak out, and for the reasons I have mentioned, I am talking direct to the American people from the Nation's Capital so we can do our own thinking. Propagandists are telling us Congressmen, be independent; yes, be independent of that man Roosevelt! We are patted on the back by the reactionary press, who tried to mislead you in the last election, and told to cut loose from the President. But, my friends, what these people really mean is not for us to be independent; oh, no, what they want is for us to be dependent on the reactionary groups. In other words, we are asked to be disloyal to the people who voted us into office.

Now I want to tell you a story about history repeating itself. It concerns President Andrew Jackson, from Tennessee, and his battle against great odds for the American people back a little over a hundred years ago. Nicolas Biddle, president of the Bank of the United States, a privately owned monopoly supported by Government deposits, tried to destroy President Jackson and subdue the people and the Government of our country. Jackson had considered the bank too dangerous and powerful, which it was. So he decided this monopoly charter should not be renewed.

HISTORY REPEATS—CENTRALIZED POWER

That decision started one of the greatest battles in all American history. It was another battle of centralized, entrenched power of a very small group in the East against the small businessmen, farmers, and laborers, the small bankers, the State bankers, and the people in general.

Banker Biddle started his fight to crush Jackson and the people by putting the screws on the Boston merchants first, and then he followed with a series of bold and ruthless acts over the whole country. He demanded return of balances, called loans, and did everything he could to ruin the State banks and the average businessman, so they would cry out against President Jackson.

And some of Jackson's fake friends did not stand by him; that is true of Roosevelt today. They forgot how they were elected and that they were supposed to represent the people—just as some have forgotten today. It was another rotten situation, with more disloyalty appearing in the ranks of President Jackson's party—which was the same Democratic Party of today. Jackson forced the resignation of one member of the Cabinet who had not stood by the guns of the people.

Banker Biddle went the limit, and the selfish big shots of the day did their bullying in the open. As a result, commerce and industry were slowed, farm prices dove down, there was unemployment just as there is today, and the big boys and their hired propagandists and lobbyists of the day tried to pin the blame on Roosevelt—I mean Jackson. Biddle was really causing a panic.

But Jackson said: "I am in no panic * * * however, I am mortified at the timidity of my friends."

Crashing and thundering, in early December, on such a day as this, the storm broke with Congress meeting. Men called leaders, such even as Clay, Calhoun, and Webster, stood ready to lead the opposition. Banker Biddle struck first, and the Senate cringed before him and slashed at the President, who was a friend to the people. The House lay down and did nothing; spoke of their independence of the President; how business should be aided, introduced a resolution to exclude the White House observer, but the anterooms were packed and jammed with the lobbyists of the bank. Biddle struck again and again, drawing more of his money away from the public, intending to cause suffering. In fact, he wrote:

"Nothing but the evidence of suffering * * * will produce any effect in Congress."

JACKSON, "THE PEOPLE! THE PEOPLE, SIR, ARE WITH ME"

But Jackson tired of all this skullduggery; he finally resented the abuse and vilification of himself. He took a short vacation, rested up, returned to Washington; and then he took the offensive. Delegations still crowded into Washington; while Banker Biddle framed his deals and referred to Congress as "those miserable people." A trainload of smug-mugs came in from Philadelphia, but Jackson told them to go home and see Banker Biddle.

Another delegation rolled in from Baltimore. To them he said: "The people! The people, sir, are with me."

But the game of baiting the President, of blaming everything on the Government, went too far; it was a big business and big speculator's ready-made depression; and honest men everywhere, whether rich or poor, realized it and backed Jackson and the Government of the United States. Jackson, who had always been a friend of honest business, won the fight. Deposits were taken from the monopoly bank; monopoly was no longer fostered, and money and credit flowed over the land, and there was prosperity and happiness.

And, my friends, I shall not waste a lot of your time in comparisons. I leave it to you to figure similarities. But remember it ended in victory for Jackson and the people, just as it will be a victory for Roosevelt and the people if we refuse to be stampeded.

LEGISLATE FOR 200 BIG OR 500,000 LITTLE CORPORATIONS?

Now I know, as you know, that Congress wants to be fair, and the American people are a fair people. That includes fairness to business, but that does not mean taking the burdens off the few big corporations and putting all the burdens on the half million or more average corporations. No doubt corrections are needed in tax law, especially affecting small independent business, and this can be done within a reasonable time.

I believe that we should be constructive, and more, I believe this administration has shown itself to be constructive, fair to the people, and decent to the stability of business. And I believe we American people should have a general program. Congress has plenty to do.

TEN-POINT PROGRAM

So here are just a few things that face us and on which the American people can work together with Congress, and I offer the following 10-point program:

First. Continue the idea of progress. We must not go back; we cannot go back. Let us solidify our gains, and then march on like our American forefathers did upon the frontiers.

Second. Give tax relief to those who need it and continue the idea of taxing excess and surplus profits; continue to tax undivided profits on amounts in excess of real business requirements.

Third. And further concerning taxation, but principally monopoly, remember that 200 corporations alone control over half of the business of the Nation. They have a stranglehold on 500,000 corporations spread over the country, right into your town or county.

Should we in Congress relieve the top, the 200 corporations, a few thousand individuals, and penalize the 500,000 corporations and the millions of Americans? No, no, my friends; your eyes should be turned upon monopoly in order to realize its effect on competitive business, labor, and farm products.

Fourth. Continue to build up social security, unemployment insurance, and old-age pensions, as much for the stability of business as for the benefit of the people of the country. Unless this is done, the capitalistic system cannot survive.

Fifth. Have an unemployment study, finding out the real truth. Let us face the issues instead of running from them. Listen, my friends, we can't solve all our problems by just abolishing big taxes, dropping our program, and leaving business at the mercy of big trusts.

Sixth. Let the American people demand, and the Congress of the United States demand by resolution, that the American Federation of Labor and the Committee for Industrial Organization get together—for their own good and the good of industry and the people as a whole.

Seventh. Get housing going, really going. Eight hundred thousand home units at least should be built each year for many years to come. If private capital will not do it, then the Government must do it. This is no experiment. England, with a population of 52,000,000, built three and a half million homes; and this country, with a population of 130,000,000, has built none.

Eighth. In direct connection with housing, let's get the regional planning, or seven T. V. A. program started, and put people to work. We must stop the destruction of our forests and rivers, the erosion of our fertile farms and our soils; we must have reforestation, navigation, and conservation, if we are to survive as a Nation. And do not forget that in doing this, water and other natural resources will be available for the production of cheap power for the people.

Ninth. In connection with all of this, the Congress should keep its pledge to enact the wage and hour bill. My friends, this only protects the very lowest scales, but it will be the basis of improving the standards of millions of the people in the lower brackets, and of increasing purchasing power, which maintains the Nation's business.

And tenth, and last, let us have peace, and stay out of war at all costs, and keep our sons and daughters at home where they can live in happiness.

My friends, one thing is certain, we want to have a decent standard of living for all, and hope for the future. These things we can only obtain if we hold our heads, and not let ourselves be stampeded by a compartively small, but noisy and powerful group. Who won this election, anyhow? Did the people elect big business and monopoly or did they elect Roosevelt? Remember the dark days of 1932, and the real victory for the people coming in 1933; and just think of the magnificent victory of only a year ago, where the people repeated that they wanted a fair deal for all, security, and the greatest good for the greatest number. So let's stick to our program and do not be afraid.

Compulsory Control of Farm Production

EXTENSION OF REMARKS
OF
HON. AUGUST H. ANDRESEN
OF MINNESOTA
IN THE HOUSE OF REPRESENTATIVES
Monday, December 6, 1937

Mr. ANDRESEN of Minnesota. Mr. Speaker and Members of the House of Representatives, an extraordinary session of Congress has been convened for the special purpose of enacting a permanent and sound program for American agriculture. As a member of the Committee on Agriculture and as a private citizen, I have devoted a great deal of time and thought to this complicated problem.

The bill before the House, H. R. 8505, proposes a new philosophy for our farmers. I have attempted a careful analysis of the legislation and am incorporating as a part of my remarks on the subject, the minority report prepared and filed by me.

MINORITY VIEWS OF MR. ANDRESEN

Your Committee on Agriculture has labored long and diligently in the preparation of the bill which is now presented to the House as the "Agricultural Adjustment Act of 1937." All members of the committee have had a common objective in their desire to propose and pass legislation that will attempt to bring economic equality, parity income and parity prices for the farmers who operate our great basic industry of agriculture.

Legislation is but a means to an end. The end expected and demanded by the farmers of the country from this extraordinary session of Congress is the passage of permanent and constitutional farm legislation which will bring them parity income, parity prices, and cost of production for the products raised on their farms. Nothing more, nothing less. Therefore, the test or yardstick to apply to the bill is whether or not the administration of its provisions will bring about the desired end or objective. If it fails in this purpose, the effort now being made to enact a sound and beneficial law, no matter how well intentioned, will be but another experiment to be chalked up alongside of the failures of the past.

We, of the minority, do not believe that the proposed bill will accomplish any of the objectives anticipated by the farmers. In fact, its passage and administration will be a great disappointment and a much greater disillusionment to them. They will find that no attempt is made to assure parity income or cost of production for either the present or the future. The farmer is primarily interested in the price he is to receive for his products and in what he must pay for the things he desires to buy for himself and family. The farmers will also discover that the proposed program will bring about a complete dislocation of agriculture in the United States, the increase in foreign production of competitive farm products, and the total disappearance of our export market.

A careful scrutiny of this much heralded "all-weather program" for agriculture will disclose the injection of a new philosophy, of dubious constitutionality, into our American system of free and independent action. Instead of following the usual and customary practice of enacting legislation to do something "for" the farmers, this bill definitely provides for doing something "to" the farmers of the United States. In a word, nearly 60 pages of the bill are devoted to the national regimentation of farmers engaged in the production of cotton, corn, wheat, rice, and tobacco, under the Secretary of Agriculture as the supreme dictator with compulsory production and marketing control, enforced by drastic penalties, and the ever-normal granary as the keystone for the New Deal for American farmers.

It is difficult for us to believe that the President and his Secretary of Agriculture would now become the sponsors of a compulsory program for American farmers, after recalling Mr. Roosevelt's words on farm legislation at Topeka, Kans., when he said:

"The plan must not be coercive. It must be voluntary and the individual producer should at all times have the opportunity of nonparticipation if he so desires.

In order that there may be no misunderstanding as to the origin of the philosophy of this bill, it is stated here that the compulsory features of the legislation are not sponsored by any national farm organization. In fact, these provisions have the bitter opposition of many national farm groups. These organizations and their members, as well as the large majority of farmers, are opposed to regimentation and compulsory control of their farming business. They want no traffic with the tens of thousands of politically minded "agricultural G-men" who will be placed on the public pay roll to travel from farm to farm enforcing the orders of the Secretary by intimidation and threat of penalty. They want to remain as free men. Further, the farm organizations in opposition to this bill have proposed sound and constructive legislation, but their suggestions have not been incorporated in the bill.

A brief discussion will now be undertaken in an analysis of the various provisions of the proposed farm bill.

SOIL CONSERVATION

The bill provides for the continuation of the Soil Conservation Act of 1936 with certain desirable amendments. All of the members of the committee are united in their support of the soil-conservation program as administered in 1936 and 1937. This program has been well received by farmers everywhere and the Nation has benefited as a result of the soil-building practices put into effect. Maximum authorizations heretofore approved by Congress for soil-building purposes should be appropriated.

Attention should here be called to the soil-conservation program for 1938 recently announced by the Secretary of Agriculture. No doubt the Secretary anticipated the enactment of this so-called compulsory ever-normal-granary bill, and therefore changed the entire congressional intent and philosophy of the Soil Conservation Act of 1936. Congress intended that benefit payments should be made to farmers for conserving acres and building soil fertility. In accordance with this intent farmers have only been paid benefits upon the acres taken out of the production of soil-depleting crops and planted to soil-conserving crops.

The announced 1938 program was changed by the Secretary, without authority from Congress, and instead of paying substantial sums to farmers for planting soil-building crops in 1938, such payments will be reduced to as low as 70 cents per acre, with the following sums paid for the production of soil-depleting crops on acreage allocated by the Secretary to farmers: Cotton, 2.4 cents per pound (estimated cost $110,000,000), plus 3 cents per pound subsidy on 65 percent of the 1937 crop (18,500,000 bales)—appropriation, $130,000,000 from section 32 funds, plus such additional benefits as may be provided by this bill. Wheat, 12 cents per bushel to farmers on allocated acreage (estimated cost $80,000,000). Tobacco, average $8 per acre; corn, 10 cents per bushel (estimated cost $75,000,000); potatoes, at $5 per acre; peanuts, at $1.45 per acre; rye, barley, and oats, and other soil-depleting crops, at $1.50 per acre.

The above benefit payments are made only to farmers who cooperate in the 1938 program. To make it plain, the Secretary has attempted to establish a voluntary ever-normal-granary program without legislative authority by purchasing compliance and cooperation from farmers through the payment of substantial sums. The Secretary or his representatives will allocate acreage for every farm both as to soil-building and soil-depleting crops, and farmers who comply with the program will receive the benefit payments.

It is estimated by the Department of Agriculture that the soil-conservation program for 1938 will cost $440,000,000. Approximately $45,000,000 of this amount will be used to cover pay rolls for National, State, and county administration, including publicity men, lecturers, travel expense, and periodicals. This enormous sum for administration rightfully belongs to the farmers. The 1936 program cost $397,634,419.11. Out of this money appropriated for the relief of farmers, $40,313,451 was spent for administrative purposes. It will suffice to say that some limit should be placed upon the cost of administration.

While it is not believed that any executive or administrative officer of the Federal Government should undertake to change a policy of Congress without legislative authority, many feel that if subsidy and benefit payments are to be continued it would be preferable to adopt the 1938 voluntary program announced by the Secretary as against the compulsory control laid down in H. R. 8505.

Limitation on payments under soil conservation

Subsidy payment to farmers has become an expediency due to low prices on certain basic commodities on account of burdensome surpluses. The responsibility for these large surpluses does not lie on the doorstep of the farmer who operates a family-sized farm but rather with the large operators who control and operate thousands of acres and with machine production, plant and harvest the excessive supplies of cotton, wheat, corn, and tobacco. If some of these large operators could be induced to properly cut their acreage, our surplus and price problem would be partly solved.

It is conceded that all producers must come into the program if it is to succeed—both large and small farmers. But why should the Government pay tens of thousands of dollars to certain few individuals and only a few paltry dollars to the man who operates the family sized farm? Our memories are always short, but surely we cannot help but recall the benefit payments under the Agricultural Adjustment Act where hundreds of large farmers received subsidy payments from the Government ranging from $10,000 to $1,000,000 each year to produce less. A repetition of such a scandal should not be permitted.

The committee has made an attempt to reduce the large payments but cutting the amount 25 percent when the subsidy exceeded $2,000. This cut is not sufficient, and it is recommended that the House adopt an amendment limiting the total payment made to any farmer.

ABNORMAL GRANARY—NOT EVER-NORMAL GRANARY

The Secretary of Agriculture seeks to establish an ever-normal granary. According to the formulas advocated by him, and now in

the bill, the farmers will be given an "abnormal granary" instead of an ever-normal granary. In the case of cotton, the Secretary recommends acreage control when production and supply have reached the staggering figure of 20,900,000 bales, with the domestic consumption and export of cotton being less than 12,000,000 bales. For wheat, compulsory control will go into effect when the supply reaches approximately 1,100,000,000 bushels, with our domestic consumption and export at considerably less than 700,000,000 bushels. For corn, a supply of 2,900,000,000 bushels is recommended with domestic consumption and export approximately 700,000,000 bushels less. The ever-normal granary is to be maintained with the supply and reserves just enumerated.

Any practical farmer or fair-minded economist will frankly admit that such a large and abnormal supply of the commodities covered by the bill can only bring about lower prices instead of parity income and cost of production.

We can take the case of corn as a typical illustration of what will happen when large supplies accumulate. The total supply of corn at the end of the present crop year amounted to 2,711,000,000 bushels. A 50-cent per bushel loan has been authorized by the President on the 1937 corn crop. The farmer is now receiving around 35 cents a bushel for his corn. The supplies of corn on hand are not excessive, but if 200,000,000 additional bushels are added to present supplies, it is elementary that the price would be considerably lower than it is today. Furthermore, the tender of a loan of 50 cents per bushel has no more help to hold the market price to that figure than the 9-cent loan on cotton, the market price on cotton being approximately 7.75 cents per pound.

At frequent intervals during the crop year, the Secretary of Agriculture announces crop estimates and supplies on hand covering all agricultural commodities. His estimates in this respect have a decided effect upon the domestic and world markets. If he announces a smaller crop than anticipated, the price goes up, and should he predict a larger crop and supply, the domestic and world price goes down. If this bill goes into operation, it is assumed that the Secretary would issue accurate estimates as to production and supplies, whether in storage on the farms or in terminal facilities. Immediately our visible supply would be advertised to the world, and there would be a material reaction in the market price level. It would make no difference if the Secretary announced that a certain percentage of the crop would not be sold because of the ever-normal-granary storage plan. Of course, the Secretary could follow in the footsteps of the Farm Board and have the Government buy all of the reserve supplies and more. This would be another fiasco, and an expensive one at that.

No; instead of building up large supplies in this country of cotton, wheat, corn, and tobacco, our energies should be directed to the recovery of our foreign markets for the surplus production. This can be done without jeopardizing our domestic market for those commodities produced in sufficient quantity to take care of our domestic needs. The principles advocated in the old McNary-Haugen farm bill supply the answer. That bill provided for an American protected price for that part of the commodity sold for domestic consumption with the surplus being sold in the world market at the world price.

LOANS ON AGRICULTURAL PRODUCTS

All members of the committee concurred in the proposal to make sound loans on all agricultural commodities, including dairy products. Past experience indicates the helpfulness and advisability of continuing a liberal but sound loaning policy.

REFERENDUM BY PRODUCERS

The bill provides for a referendum vote by the farmers before the compulsory control provisions, as anounced by the Secretary, go into effect. The Secretary is required to permit all farmers affected by his order to participate in the referendum. If more than one-third of the number of farmers voting are opposed to the control program, the Secretary will not put the compulsory plan into operation. A referendum of the farmers is highly desirable. However, it is believed that such a referendum would be declared unconstitutional by the Supreme Court. In support of this opinion, the case of *Carter* v. *Carter Coal Co.*, decided in May 1936 by the Supreme Court is cited. This case involved a referendum vote among the producers of coal, and the Court said:

"That the power conferred upon the majority is, in effect, the power to regulate the affairs of an unwilling minority. This is legislative delegation in its most obnoxious form; for it is not even delegation to an official or an official body, presumptively disinterested, but to private persons whose interests may be and often are adverse to the interests of others in the same business."

Under the separability clause contained in the bill, and if the Court would declare the referendum unconstitutional, the Secretary could put into effect the compulsory program despite the opposition of the majority of farmers. In fact, he would be compelled to do so under the law.

Compulsory corn control

The most drastic control provision is found in the corn title. Corn farmers living within the so-called commercial-corn area, consisting of 10 States in the Middle West, are to be regimented, inspected, and penalized to the *n*th degree, while the corn farmers living outside of the commercial area can produce, feed, and sell without limit. This means, of course, that there will be a rapid expansion of corn production outside of the commercial area and particularly in contiguous counties, which will result in a break-down of the entire scheme. As an illustration, it might be well to cite some of the States not in the corn area and give the corn production for 1937. Pennsylvania, 61,680,000 bushels; Michigan, 58,320 bushels; Wisconsin only 18 counties in commercial area, but entire State produced 76,864,000 bushels; Virginia, 38,844,000 bushels; North Carolina, 45,357,000 bushels; Georgia, 47,368,000 bushels; Kentucky, 79,482,000 bushels; Tennessee, 68,592,000 bushels; Alabama, 45,834,000 bushels; Mississippi, 45,378,000 bushels; Arkansas, 40,640,000 bushels; Texas, 72,048,000 bushels, etc. More than 50 percent of the corn produced in this country is grown outside of the commercial area and prospects are very good under the proposed program to at least double present corn acreage in the unrestricted area.

The States included in the commercial area and the corn production for 1937 are herewith given: Minnesota (southern one-third of State), entire State production, 169,974,000 bushels; Iowa, 496,620,000 bushels; Illinois (except 14 counties in southern part of State), State production, 434,746,000 bushels; South Dakota (18 counties in southeastern corner), production entire State, 45,748,000 bushels; Nebraska (eastern and southern part of State), entire State production, 83,106,000 bushels (5-year average, 223,843,000 bushels); Kansas (34 counties in northern part), entire State production, 32,280,000 bushels (5-year average production, 126,756,000 bushels); Missouri (northern half), entire State production, 124,308,000 bushels; Wisconsin (18 counties, southern part), total production for entire State, 76,864,000 bushels; Indiana (except 18 counties), total State production, 209,790,000 bushels; Ohio (western half), total State production, 166,005,000 bushels.

The compulsory control scheme for the commercial corn area will now be considered. The Secretary of Agriculture allocates a definite number of acres for corn production for every farm in the area, and when the compulsory program goes into effect, every farmer in the area is given a marketing quota. Marketing quota means the amount of corn that a farmer is permitted to sell, exchange, give away, or feed to livestock and poultry. The marketing quota becomes effective when the national supply has reached 2,900,000,000 bushels of corn. If a corn farmer produces more than his marketing quota, the excess production must be placed in storage and under seal in a suitable corncrib, subject to the instructions from the Secretary. The farmer is not allowed to sell, exchange, give away, or feed any of the corn placed under seal. If he does not have a suitable granary or corncrib in which to place the surplus corn, he must build one at his own expense according to Government specification.

Now, we come to the part of the program where the penalty provisions begin to operate. Should a farmer find himself running short of silage and field corn for his hogs and cattle, he would be penalized at the rate of 15 cents per bushel if he broke the seal on his corn crib and fed some of the stored corn to his starving animals. The same penalty would apply should he dispose of his corn in any manner, and the penalty would be collected by a suit in the United States district court under the direction of the Attorney General at Washington. In addition to being compelled to pay the penalty through legal process, the corn farmer would also lose his benefit payment under the Soil Conservation Act. It might be well to mention that every farm will be inspected and corn measured or weighed, in the silos and cribs, by representatives from the Department of Agriculture. More than 1,000,000 farms in the commercial area produce corn.

If the corn farmer lives up to the program outlined for him by the Secretary of Agriculture, he will receive 10 cents per bushel benefit payment on the average production (30 bushels to the acre) and such other subsidies as Congress may see fit to appropriate.

It is believed by many that the program for corn is unsound and will work to the detriment of all agriculture.

TOBACCO

There are times when mere men rise above politics and become statesmen. The drafting of the tobacco section was no such an instance. The provisions of this title provide for strict compulsory control for tobacco farmers, but the effect of such control is not felt by the producer if he markets more pounds of tobacco than permissible under his quota, for he is subject to no penalty. The buyer pays the penalty of 50 percent of the market value if he knowingly makes a purchase from any tobacco farmer who sells more than his allowable quota. Another item of particular significance in this title is the fact that a majority of the producers are exempt from the provisions of the bill. An exemption has been provided so that producers shall not come within the provisions of the bill or the marketing quota if they produce from 2,400 to 3,200 pounds or less.

Politically speaking, we find an ideal situation in the compulsory control for tobacco. The majority of tobacco farmers are exempt from the provisions of the bill; no penalty is collected from the producer, and if he can convince the buyer that he is not selling contraband or bootleg tobacco, he can receive his full market price without deduction. The buyer pays the penalty and the producer does not feel the sting of compulsory control.

WHEAT

According to expert authority from the Department of Agriculture, compulsory control and marketing quota will go into

effect when the Nation has produced a total supply of 1,027,000,000 bushels of wheat. The details of the plan are similar to the control and storage provisions explained in the corn paragraphs of this report with the exception that wheat plan covers the entire country. Each wheat farmer is assigned a definite acreage for wheat production, and is required to store up to 20 percent of his crop above his marketing quota. The amount placed in storage cannot be sold or given away, but it may be used for feed. If the wheat farmer lives up to his contract and only plants wheat on the allocated acreage, and places in storage the excess supply above his marketing quota, he will receive a benefit payment of 12 cents per bushel on the normal production of his allotted acreage. He will also be eligible to receive such other benefits as Congress may provide in H. R. 8505.

In the event that the wheat farmer fails to comply to his part of the agreement, and should he dispose of his storage wheat, he will be subject to a penalty of 15 cents per bushel, and also lose all other benefit payments.

Wheat is a world commodity, and it is not believed that the piling up of large visible surpluses in this country can do anything but cause a lower price level. Parity price on wheat is said to be $1.20 per bushel. The farmer should receive at least this amount, and we believe that if the principles of the McNary-Haugen bill would be applied, he would come closer to it than under the provisions of the bill before the House. The wheat farmers do not want the compulsory program.

COTTON PROGRAM

The cotton program as set forth in the bill contemplates acreage control, without production control or marketing quotas. Each cotton farmer is assigned to definite number of acres upon which he may grow cotton. He can grow without penalty, as much cotton on his allotted acreage as nature and fertilization will permit. He can also sell all of the cotton produced on the allotted acreage without restriction or penalty. If he plants additional land in cotton over and above his allotted acreage, a penalty of 2 cents per pound will be collected from him on the sale of such surplus production. This farmer would then become a noncooperator, and as an additional penalty, would forfeit his entire benefit payment.

The 10-year average for cotton production has been approximately 170 pounds per acre. According to the Secretary of Agriculture cotton producers were blessed with an average production of 228 pounds per acre for the cotton crop of 1937. This, he said, was due in part to the soil-conservation program which brought about increased production of cotton on the acres treated to soil conservation in the 1936 program, and in part from ideal weather conditions. These facts are cited to show the ineffectiveness of the proposed cotton-control program. The cotton crop for 1937 exceeds 18,500,000 bales. The carry-over amounted to 6,000,000 bales, making a total of 24,500,000 bales on hand. Of this enormous supply 6,000,000 bales will be used in this country during the next 12 months and approximately 4,400,000 bales will be sold in the foreign market. This will leave a carry-over on August 1, 1938, of more than 14,000,000 bales.

The program provided in the bill, as advocated by the Secretary of Agriculture, provides for the use of 28,000,000 acres for cotton production in 1938. It is estimated that this acreage will produce 12,000,000 bales. This amount plus the carry-over will provide a total supply of 26,000,000 bales at the end of the 1938 crop year.

What shall we do with the cotton? During the past 5 years our cotton exports have decreased from 8,000,000 bales to 4,400,000 bales. Foreign production of cotton has increased during the same period from 10,000,000 bales to 20,000,000 bales. Cotton authorities in the South are unanimous in the opinion that the cause of the enormous increase in foreign production of cotton, as well as the rapid loss of our foreign market, is due here to artificial interference on the part of the Government. The difficult situation confronting cotton farmers must be recognized by everyone, and drastic steps taken to revive world markets for cotton and to increase domestic consumption. Otherwise, neither legislative fiat nor compulsory control nor 9-cent loans and 3-cent subsidies can save the cotton South.

Cotton farmers complying with the program for 1938 will receive a 3-cent-per-pound subsidy on 65 percent of the 1937 crop which aggregated 18,500,000 bales. The sum of $130,000,000 was provided for this purpose in the closing days of the last session. In addition to this subsidy, the cotton farmer will receive 2.4 cents per pound on the production of cotton on the allotted acreage for 1938 plus such other payments as Congress may authorize. Loans at the rate of 9 cents per pound are also being made on the 1937 crop, and a cotton farmer just can't afford to stay out of the program. However, continued payment of large subsidies will not solve the cotton problem.

RICE PROGRAM

The rice program is similar to the compulsory control of wheat with this exception. The buyer of contraband rice over and above the marketing quota must pay a penalty of one-fourth cent per pound if he makes a purchase, while the wheat farmer himself must pay the penalty.

CONSTITUTIONALITY OF COMPULSORY CONTROL

It is believed that in view of the decision of the Supreme Court in the Butler case, when passing upon the constitutionality of the Agricultural Adjustment Act, that the compulsory-control provisions of the proposed bill will be declared unconstitutional. We quote here some of the pertinent statements made by the Court with reference to the right of the Federal Government to control production of agriculture.

The Court said: "It is a statutory plan to regulate and control agricultural production, a matter beyond the powers delegated to the Federal Government." Also, "The tax, the appropriation of funds raised, and the direction for their disbursement are but parts of the plan. They are but means to an unconstitutional end." In referring to the Bankhead Compulsory Cotton Control Act with its penalty provision, the Court said: "The Congress has gone further and, in the Bankhead Cotton Act, used the taxing power in a more minatory fashion to compel submission. This progression only serves more fully to expose the coercive purpose * * *." Further: "Congress has no power to enforce its commands on the farmer to the end sought by the Agricultural Adjustment Act."

It is said that there are those who believe that certain proponents of this type of compulsory legislation (who are not Members of Congress) are very anxious to have enacted into law legislation which is obviously unconstitutional, and which will be so declared by the highest Court, in order to provide new life for a continued attack upon the Supreme Court. This is not the way we should do business, for prejudice and class hatred of this character have no place in our American system if we are to continue as a free democracy. When changes are needed in our governmental system, the people can bring them about in a constitutional manner without the necessity of hatred or intimidation.

DISLOCATION OF AGRICULTURE

Agriculture in the United States, with its diversity of interests, is so delicately balanced that when hasty and artificial action is taken to change production programs in the aid of one section, other parts of the country are adversely affected. No one can object to the normal and natural expansion of the various types of agriculture in all parts of the country, but when this is done in a wholesale manner with Government subsidies, surely those injured thereby have a right to register a vigorous protest.

The program intended by the bill before us, as announced by the Secretary of Agriculture, contemplates the taking of 40,000,000 acres of cotton, tobacco, wheat, and corn land out of present cultivation, and the planting of said acres into clover, alfalfa, and other legumes, ostensibly for soil-building purposes. These are feed crops, and it is natural to assume that they will not be wasted or destroyed but fed to dairy cattle and other livestock. Dairying is now on the verge of national surplus production, and if hundreds of thousands of additional farmers are subsidized by the Federal Government to go into the dairy business, it will only take a few years to bring ruin to this industry in all parts of the country.

What has been said in the preceding paragraph with reference to dairying applies with equal force to other branches of diversified agriculture engaged in production on a national scale.

The gentleman from Wisconsin, Mr. BOILEAU, will offer an amendment on the floor which seeks to prevent absolute dislocation of all diversified agriculture. The adoption of this amendment is urged, and the substance is here quoted for the convenience of the members.

BOILEAU AMENDMENT

Subsection (d) of section 2 of the pending bill which amends the Soil Conservation and Domestic Allotment Act provides as follows:

"(d) Any payment or grant of aid under subsection (b) shall be conditioned upon the utilization of the land, with respect to which such payment is made, in conformity with farming practices which the Secretary finds tend to effectuate any one or more of the purposes specified in clause (1), (2), (3), (4), or (5) of section 7 (a)."

Amendment offered by Mr. BOILEAU: Page 9, line 4, at the end of such subsection, strike out the period, insert a comma, and add the following: "And (except for lands which the Secretary determines should not be utilized for the harvesting of crops but should be permanently used for grazing purposes only) shall be further conditioned upon the utilization of the land, with respect to which such payment is made, so that soil-building and soil-conserving crops planted or produced on lands normally used for the production of cotton, wheat, rice, tobacco, or field corn shall be used for the purpose of building and conserving the fertility of the soil, or for the production of agricultural commodities to be consumed on the farm, and not for market. As used in this subsection the term 'for market' means for disposition by sale, barter, exchange, or gift, or by feeding (in any form) to poultry or livestock which, or the products of which, are to be sold, bartered, exchanged, or given away; and such term shall not include consumption on the farm. An agricultural commodity shall be deemed consumed on the farm if consumed by the farmer's family, employees, or household, or by his work stock; or if fed to poultry or livestock on his farm and such poultry or livestock, or the products thereof, are to be consumed by his family, employees, or household."

DAIRYING

The production of milk and dairy products is the largest agricultural business in the United States. As compared with the five basic commodities covered by the proposed bill for the 1936–37 crop year, the following figures tell the story: Milk, $1,761,000,000; cotton (lint and seed), $947,797,000; corn, $1,518,411,000; wheat, $624,338,000; tobacco, $269,061,000; rice, $40,730,000.

The dairy industry received no benefits whatsoever from the operations of the Agricultural Adjustment Act or other New Deal legislation. Quite to the contrary, the dairy farmers of this country have been used as trading stock by the administration in the carrying out of its reciprocal-trade policy. Tariff duties have been slashed on dairy products and foreign farmers encouraged to increase their production for shipment into the United States in competition with domestic production. During the first 9 months of 1937, 10,148,000 pounds of butter and 42,000,000 pounds of cheese produced in foreign countries entered our ports for sale in this country. In the same period, several hundred million pounds of competitive oils and fats were imported to be used in competition with dairy products. The effect of these importations has been to reduce the price received by American dairy farmers for their products with a consequent loss in purchasing power.

No unit of agriculture has a greater purchasing power than the dairying industry. The dairy farmer has a daily cash income and he is generally a good spender when he has the money. The dairy group has asked very little from the New Deal administration. Their only request, which required no subsidy, was for the preservation of their American market. This has been denied to them, and instead of giving them relief, they have been bartered away.

If permanent farm legislation is to be adopted, as proposed in the pending bill, the dairy farmers demand the right to be included in the economic picture for agriculture. Each basic commodity covered by the bill has written its own ticket, and now the following amendments are offered for adoption and inclusion in the bill as the permanent program for the dairy industry. The gentleman from Minnesota [Mr. ANDRESEN], a member of the committee, will offer the amendments.

ANDRESEN DAIRY AMENDMENTS

"SECTION 1. The importation of agricultural products into the United States is hereby prohibited where the landed cost of such products plus the tariff duties are lower than the domestic cost of production."

The above amendment covers all farm products, since the dairy group is of the firm conviction that all branches of American agriculture are entitled to have the full benefit of the domestic market.

"SEC. 2. The Secretary of State is hereby directed to discontinue the practice of binding on the free list or binding at the present rate of excise taxes agricultural commodities imported into the United States. The Secretary of State is further authorized to advise the Governments of Brazil and the Netherlands that at the expiration date of the respective trade agreements the concessions granted by the United States with reference to binding babassu oil and starches on the free list and freezing the excise tax on palm oil at 3 cents per pound will not be continued.

"SEC. 3. That on and after 6 months from the enactment of this act foreign shipments of dairy products into the United States are prohibited unless said dairy products have been produced from milk or cream of cows which are free from bovine tuberculosis."

The amendment designated as section 3, only seeks to compel foreign farmers who desire to ship their dairy products into the United States, to comply with the same sanitary regulations and laws as are in effect for American dairy farmers.

COST OF PROPOSED PROGRAM

In addition to the $500,000,000 authorization included in the soil-conservation program, it is roughly estimated that $200,000,000 more will be required to carry out the new benefits of H. R. 8505. This legislation does not have a processing tax, and whatever funds are provided must come from general revenues.

CONCLUSION

Time and space will not permit a complete discussion of all of the ramifications of the Agricultural Adjustment Act of 1937. It is to be hoped that the membership of the House will take the time to inspect its many complicated provisions. Suffice to say, we firmly believe that the compulsory control programs outlined in the bill are unconstitutional, unsound, un-American, and will work to the detriment of American agriculture.

It is recommended that any permanent farm program be based on voluntary cooperation under farmer control; that the family-sized farm be given preference over large commercial operators; that the Soil Conservation Act be continued; that the principles of the McNary-Haugen bill be adopted so as to provide for the revival of our export market for surplus commodities, and a domestic price level covering products used in home consumption; that the American market be guaranteed to the American farmer to the limit of production; that a permanent loan policy for crop storage on farms be provided; and that in the drafting of a permanent program all branches of agriculture be given equal consideration.

The welfare of agriculture is not a political matter, and therefore all groups should join in the drafting of sound and beneficial legislation in accordance with American ideals and standards.

Respectfully submitted.

AUGUST H. ANDRESEN.

NOVEMBER 27, 1937.

We concur in the views expressed in the above minority report.

J. ROLAND KINZER.
CHARLES W. TOBEY.
CLARE E. HOFFMAN.
BERT LORD.

The Political Situation

EXTENSION OF REMARKS

OF

HON. HARRY S. TRUMAN

OF MISSOURI

IN THE SENATE OF THE UNITED STATES

Tuesday, December 7 (legislative day of Tuesday, November 16), 1937

ARTICLE BY LUCY SALAMANCA

Mr. TRUMAN. Mr. President, I ask unanimous consent to have printed in the RECORD an article by Lucy Salamanca entitled "Nation Finds Generous Supply of Presidential Timber," appearing in the Washington Evening Star of December 5, 1937.

There being no objection, the article was ordered to be printed in the RECORD, as follows:

[From the Washington Evening Star, December 5, 1937]

NATION FINDS GENEROUS SUPPLY OF PRESIDENTIAL TIMBER

(By Lucy Salamanca)

If "life begins at 40" for some, as contended, Presidential life is going to begin for somebody in '40, that is sure. The list of possible candidates grows. To such an extent does it grow, in fact, that it is a brave man or foolish who would venture at this stage of the game to analyze likelihoods. However, there is a definite interest attached to certain names mentioned in connection with the next Presidential election, and this seems as good a time as any to familiarize ourselves with the background of the individuals so mentioned without venturing analyses or predictions of any nature.

We have all heard the list, or portions of it, and not a few of us have added our own favorite to the queue. Barkley, Byrd, McNutt, Vandenberg, Earle, Moore, Farley, Garner, La Follette, Wallace, Ickes, Hull, March, Clark, Harrison, Lodge are among those this writer has heard mentioned most often on the "Hill" and in Government departments. Now and then we even gave heed to a feminine possibility, which, while a somewhat empty gesture, we admit, injected at least a note of interest. Those laughing little whispers have grown into pronunciamentos on occasion, so we report without conjecture.

Without passion or prejudice, then, let's take a look into the factual background of these gentlemen and make our own decisions as to just what kind of Presidential "timber" such backgrounds are likely to provide.

BARKLEY. When Senator ALBEN W. BARKLEY, of Kentucky, fell heir to the difficult post made vacant by the untimely death of Joseph T. Robinson some months ago, he stated, in a private interview with the writer, that, in his opinion, the next Presidential candidate from the Democratic Party would set "as his goal and objective" the advancement of liberalism, stating that "even from the time of Jefferson the party has been distinguished for its liberal tendencies and it should proceed along liberal lines." It was perhaps with this philosophy in mind that many have mentioned the name of BARKLEY as possible Presidential candidate on the Democratic ticket for 1940; certainly the record shows his tendencies.

A Kentuckian, BARKLEY has always been a vigorous proponent of the New Deal and a close friend of the President, carrying out the objectives of his party. Politics, he states, he "breathed with his schoolbooks."

He served as janitor, worked in a livery stable, peddled kitchenware through the Georgia countryside to earn an education, and matriculated in a little Methodist institution, Marvin College. Later he studied in Emory College in Atlanta and topped off his training by attendance at the Law School of the University of Virginia.

BARKLEY was swept into the House of Representatives on the great Wilson wave of 1912, and there won a place on the Interstate

Commerce Committee, taking part, as a member of that body, in the framing of wartime legislation that authorized Government control of the railroads. He helped pass the famous Adamson 8-hour railroad law and later contributed to shaping the Transportation Act when the railroads were turned back. He fought for liberalization of the Howell-Barkley bill—a measure that started a royal row on the Hill and invoked thereby a rarely used House rule. While a filibuster interrupted progress on the measure, activities among executives and workmen leading to an agreement brought about almost unanimous passage in the December session, and as a result when BARKLEY ran for the Senate in 1926 against Richard F. Ernst he was strongly backed by the railroad unions. Highway improvement, abolition of the "lame duck" session, support of prohibition, repeal of prohibition, and a fight on certain schedules of the Smoot-Hawley Act have been some of his many legislative interests.

BARKLEY assisted in the stock-market investigation that led later to the Securities and Exchange Commission. He helped write the Emergency Banking Act of 1933, and in 1935 he wrote the "death sentence" clause in the Utility Holding Company Act. He supported Federal housing, home owners' loan bank and deposit guarantee legislation, N. R. A., and A. A. A. The only time he has departed from the President on a major issue was when he voted to override the soldiers' bonus veto.

BARKLEY believes that the "definite accomplishments and aggressive constructive program of the administration have set a standard of activity for the American people."

Selecting at random from our list, consider next a talented young man who has been mentioned as a Republican possibility—35-year-old Senator HENRY CABOT LODGE, Jr., of Massachusetts.

In his own words, LODGE believes that "able professionals" are what politics needs.

LODGE served for 5 years in Washington as political news correspondent for the New York Herald Tribune, which may have been an excellent training school for politics itself. This, again, is a belief of the young Senator, who once stated that political journalism, "which undertakes to know the public temper, is perhaps the closest approximation to politics."

LODGE has publicly deplored the "presence of midgets in the seats of the mighty," and that expediency which "dictates too often the way in which a Senator casts his vote."

Bearing with him to the Senate the weight of his distinguished grandfather's prestige, the junior Senator from Massachusetts, like that grandfather, was 30 years old when he first became a member of the Massachusetts House of Representatives.

LODGE was educated at Middlesex School, in Concord, from which he was graduated in 1920. In 1924 he received his B. A. from Harvard, and while still in college began his journalistic career with the Boston Evening Transcript, becoming associated with the Herald Tribune directly after his graduation. During his newspaper days he covered political conventions, affairs in Nicaragua and in Mexico, and was foreign correspondent in Europe and the Far East.

He served two terms in the Massachusetts Court, identifying himself there with the committee of labor and industries. Running against Governor Curley, Democrat, for the United States Senate, he polled 115,644 votes against the Governor's 92,623. The young Senator has urged rededication to the "American dream," which, in the words of Walt Whitman, embodies the justification and main purpose of the United States in our "plowing up in earnest the interminable average fallows of humanity."

Four members of the Cabinet have been prominently mentioned with respect to the 1940 Presidential picture—Farley, Wallace, Ickes, and Hull. "Nothing but advances will be made in the liberal program of President Roosevelt in 1940, no matter who succeeds him," Postmaster General Farley declared to this writer in a private interview last August. And there are those who believe Mr. Farley may be the one to make those "advances."

Secretary of State Hull, however, has been as frequently designated as the affable chairman of the Democratic National Committee. And if his age in 1940 be mentioned in the next breath as a consideration, so are Farley's aspirations for governorship of New York, in the first instance. Mr. Hull's efforts at peace have distinguished his career as Secretary of State. To promote peace, a spirit of fair play, and friendly relations among nations is the major concern of this Presidential possibility.

Last July he told this writer in a private interview that the policy of isolation, of self-containment, of autarchy "that cuts one nation off from another can only lead to moral isolation and an intensified nationalism that breeds international friction, fear, envy, and resentment, and destroys the very foundation of world peace." On that occasion he also expressed the belief that it is necessary to establish "a nonmilitaristic point of view, through a revitalization of international law, which will achieve renewal of those finer relationships between nations upon which freedom, peace, prosperity, and civilization itself depend."

So much for the point of view of this possible candidate. He was born in 1871 in Tennessee and was graduated from the law department of Cumberland University in Lebanon, Tenn. For two terms he served in the lower house of the Tennessee Legislature. Hull was elected to every Congress from the Sixtieth to the Seventy-first, with the exception of the Sixty-seventh. From 1921 to 1924 he was chairman of the Democratic National Committee. He was elected to the United States Senate in 1930 and appointed Secretary of State in 1933.

To turn our attention to a Progressive whose name has circulated freely in discussions of possible Presidential candidates in 1940, there is ROBERT M. LA FOLLETTE, Jr., whose independence of thought and action have been the joy of his friends and despair of his opponents. Born in 1395, LA FOLLETTE was elected to the United States Senate on September 29, 1925, to fill the unexpired term of his father, Robert M. La Follette. He was reelected in 1928 and again in 1934. In this November of 1934 he received twice as many votes as his Democratic and Republican opponents. The vote stood 440,513 for La Follette, 223,438 for John Callahan, Democrat, and 210,569 for John Chapple, Republican. The young LA FOLLETTE's present term expires in 1941.

Because of the fact that he has consistently warned against the dangers of monopolistic control in American industry and was gathering facts in the matter long before the question of monopolies became of national interest with the President's recent request for investigation into their possible effect upon the high cost of food, Charles H. March, member of the Federal Trade Commission, has been frequently named in Republican circles as a likely candidate in 1940. As an attorney and guardian of the public interests for many years and a member of the important Federal Trade Commission since 1929, Colonel March has made friends among Democrats and Republicans alike for his impartial attitude and consistent contention that there are two sides to every question.

In an interview with the writer in July, Colonel March expressed the refreshing belief that "the important thing is not if one be a Democrat or a Republican, but if he be first of all a good citizen. There is too much talk nowadays," he stated, "of parties. Political affiliations should not overshadow national service."

Economic progress, national trends, industrial contributions or abuses, have passed in close review before the Federal Trade Commission, by the nature of its duties, and in all the years he has served that body, Colonel March has preached the dangers that lie in monopoly and the concentration of wealth. These, he asserts, are world problems, and underlie civil war in Spain, the Communist revolution in Russia, and the death of democracy in other countries. Twice President Roosevelt has expressed publicly, in the last few months, similar fears with regard to the effect of monopolistic control in this country—once on the occasion of laying the cornerstone for the Federal Trade Commission Building on Constitution Avenue and more recently in his request that the Commission investigate monopolies with reference to the increasing cost of living.

Another Republican, likewise an attorney, who has been named as a possible Presidential candidate in 1940, is Senator ARTHUR H. VANDENBERG, of Michigan. Mr. VANDENBERG has also had an active and interesting public career. Born in Grand Rapids in 1884, he studied law at the University of Michigan. He served as editor and publisher of the Grand Rapids Herald until his appointment to the United States Senate on March 31, 1928.

In 1916 and 1928 VANDENBERG was chairman of the Michigan Republican State convention and from 1912 to 1918 was a member of the Republican State Central Committee of Michigan. He served the term of his appointment to the Senate from March 31, 1928, to November 6, 1928, when he was elected for the short term and for the long term ending in 1935. He was reelected for the term ending in 1941.

One of the 17 charter members, and an incorporator of the American Legion, Senator BENNETT CHAMP CLARK, Democrat, of Missouri, has stanch advocates in veterans' circles. Parliamentarian of the House of Representatives from 1913 to 1917, Senator CLARK's political career was interrupted by the war. He is past national commander of the American Legion. He has attended every Democratic convention since 1900 and in 1916 was parliamentarian of the Democratic National Convention. An attorney by profession he was elected to the United States Senate November 8, 1932, but was subsequently appointed to the Senate on February 3, 1933, by Gov. Guy B. Park to fill the unexpired term of Harry B. Hawes, when that gentleman resigned.

The name of Senator ARTHUR HARRY MOORE has found its way latterly into the press in connection with these 1940 possibilities. A Democrat from Jersey City, MOORE has studied medicine and law. He has been a mayor's secretary, city tax collector, city commissioner, and twice Governor of New Jersey. On November 6, 1934, he was elected to the United States Senate with 785,971 votes, against his opponent's 554,483 votes.

Senator HARRY FLOOD BYRD, of Berryville, Va., has heard his name echoed in the 1940 lists. Senator BYRD's official biography provides one with the rather startling information that the gentleman from Virginia "entered business at the age of 15 as a newspaper publisher, farmer, and apple grower." With this excellent start, Mr. BYRD was elected in 1915 to the Senate of Virginia, where he served until elected Governor for the 1926–30 term.

Gov. John Pollard appointed him to the Senate on March 4, 1933, and on November 7, 1933, he was elected for the unexpired term of Claude A. Swanson, who had resigned. He was reelected for the full term in 1934.

Those who persist in the belief that the South "is to be considered" have adopted their own alliterative slogan: "Pat for President!" Long a favorite on the Hill, Senator HARRISON, of Mississippi, has had an extensive legislative experience, having served as Member of the House of Representatives in the Sixty-second, Sixty-third, Sixty-fourth, and Sixty-fifth Congresses. He had been district attorney down in Mississippi for 6 years prior to that. In 1918 Pat was elected United States Senator for the term ending in 1925. He was reelected in 1924 and 1930 and again in 1936 for the term ending in 1943.

Address by Hon. James A. Farley at Lansing, Mich.

EXTENSION OF REMARKS

OF

HON. PRENTISS M. BROWN

OF MICHIGAN

IN THE SENATE OF THE UNITED STATES

Tuesday, December 7 (legislative day of Tuesday, November 16), 1937

ADDRESS OF HON. JAMES A. FARLEY, CHAIRMAN OF THE DEMOCRATIC NATIONAL COMMITTEE, AT A DINNER GIVEN BY THE JEFFERSON CLUB, LANSING, MICH., SEPTEMBER 30, 1937

Mr. BROWN of Michigan. Mr. President, I ask unanimous consent to have printed in the RECORD a speech delivered by Hon. James A. Farley, chairman of the Democratic National Committee, at a dinner given by the Jefferson Club at Lansing, Mich., September 13, 1937.

There being no objection, the speech was ordered to be printed in the RECORD, as follows:

Michigan, I think, supplies the finest forum of political discussion of any State in the Union. Speaking from what we might describe as the purely professional viewpoint, there is more interest, as well as more fun, in talking politics in a community where ordinarily election results cannot be forecast than in those sections where one of the major parties has complete domination. You people have experienced all the ups and downs of the political seesaw. Just now you are, I believe, a thoroughly Democratic State, even though there are one or two officeholders of the opposite political faith who have managed to survive the political storms of the past few years. However, matters of that kind can be attended to in due course of time.

On arriving here in Michigan, it was pleasing to find that this State, which, because of its varied interests, might serve as a model for the entire Nation, is enjoying a substantial measure of prosperity and that there is noticeable a fine spirit of optimism and courage whenever the future is discussed. The same tale can be told of every State in the Union. This country is moving forward once again in all its strength and virility and the people have little time and less patience with those who like to dispute the evidences of their own senses. To those of you who recognize facts when you see them, the reason for this present encouraging state of affairs is obvious. This State is doing well under the administration of my good friend, Gov. Frank Murphy, who has handled the most trying problems with rare skill and understanding, and I know that the people of Michigan are grateful to Franklin D. Roosevelt for the magnificent way in which he has fulfilled the promises made 5 years ago. You had faith in him then. You emphasized that faith last year, and we all know that your confidence in him is as great today as it was then. In the convention of 1932 the delegation from Michigan cast its unanimous vote for Roosevelt on every ballot. And in the convention at Philadelphia last year Frank Picard, of Saginaw, seconded the renomination of our great Chief Executive, who was made the standard bearer of his party for the second time by acclamation. Many individuals in this audience were members of that convention.

What I said a few moments ago in relation to the political ups and downs experienced in Michigan is not, in my judgment, subject to amendment. I think you will agree that the period of political uncertainty in this State is past, and that for a long time to come Michigan will be counted on as safely Democratic. As I have frequently said on similar occasions, the period of Democratic success is bounded and limited by the lines of efficiency, honesty, and sincerity. In other words, our party will remain in power as long as it deserves to remain in power. The yardstick must be faithful performance of public duty. Some of us may think that we are wise politicians, but cleverness in devising party tactics can never stand the test as a substitute for good government. There are not enough hard-and-fast Democrats in the Nation to insure invariable success. There are not enough hard-and-fast Republicans in the Nation to bring about Democratic defeat. The party vote in any campaign is merely the foundation, and only the foundation, for success. In the last analysis, the fate of the Nation is determined by that great body of men and women who cast their ballots for the best candidate and the most satisfactory results. The only safe way is to remember at all times that majority rule is the deciding factor in a democracy and that any party which loses touch with the masses of people is courting certain defeat.

It is perfectly natural that in a time like this the captains of the Republican Party should see their only hope of returning to power in the possibility of a Democratic split. Having forfeited public confidence themselves, they hope that our own party will be foolish enough to do likewise. Because, unless the solidarity of our own ranks is broken, the opposition leaders know that they might as well spare the expense and bother of primaries and conventions and let the coming elections go by default. And so, under the circumstances, they are tempted to buoy up their spirits by painting a picture of a serious rift in the Democratic ranks.

In that task they are aided by a certain element of the public press that has been hostile from the beginning to the ideals and objectives of the present administration. Of course, in a country as extensive as ours in population and area, a country which prides itself on the independence and resourcefulness of its citizens, there is bound to exist a certain difference of opinion on questions of public policy. Everyone recognizes that to be a fact. But permit me to say with emphasis that these differences of opinion will be ironed out within our own party. In proof of that fact, you may have noticed that these noisy declarations about a new party alinement come from hostile newspapers and from the Republican camp. The expression is a wish and a hope—and I may add, an invalid wish and a vain hope. The wish is without expectation. The hope is a hope of despair. For in every State in this Union you will find the people are supporting President Roosevelt just as firmly as they did before. The leaders of the Republican Party are still misjudging public sentiment in the manner that cost them so dearly in last fall's election.

Once again the captains of the G. O. P. are underrating public intelligence. Apparently they still harbor the delusion that the voters are unable to weigh the value of words against deeds. They are incapable of realizing that the public has far greater respect and devotion for a political party that meets grave problems in straightforward and resolute fashion than it has for a party that hangs back and does nothing, too timid to move and too much afraid of the consequences even to try.

The Democratic Party took over the direction of national affairs on the promise that it would make an honest effort to remedy the ills of this country, whether they were social or economic, industrial or agricultural. For the past 5 years it has kept that promise faithfully and well. Our party doesn't duck and it doesn't dodge. Our leaders never sit idle and hope that something will turn up, that conditions will take care of themselves. Our leaders have never committed the blunder of assuming that deep-seated economic troubles could be righted by the Pollyanna process of announcing that prosperity was just around the corner. On the contrary, the Democratic Party has today the confidence of the overwhelming mass of American voters because it was sensible enough and brave enough to substitute a constructive program of workable policies for the do-nothing attitude of the previous administration. This administration intends to continue that method of doing things.

The Republican Party has also made the fatal error of protesting too much. Ever since the present Chief Executive entered the White House his policies have been greeted by a never-ending howl of wails and lamentations on the part of the opposition. Times without number in the past few years they have predicted that the Roosevelt policies were bringing the country to the brink of destruction and ruin. And think how silly those predictions have been. Today the economic and political stability of the United States is almost unrivaled. The fires of industry have been lighted once again, agriculture is enjoying a measure of prosperity, and the arteries of trade and commerce are pulsing with new life. For a patient who was supposed to be caught in the grip of a serious malady Uncle Sam seems to be about the healthiest person imaginable. In fact, to use an old expression, he is too healthy to suit the critics of Mr. Roosevelt's policies.

But the healthy condition of Uncle Sam is not the only proof that the President's adversaries were speaking with tongue in cheek when they predicted disaster from his policies. The more striking proof is the fact that they never dare suggest the repeal of those policies which have contributed to our present splendid condition. Let me divert for a moment to indulge in a very modest prediction: The Republican Party will never dare propose the repeal of the bank insurance deposit law; it will never dare propose abandoning the sensible Democratic policy of Federal aid for agriculture; it will never dare suggest repeal of the Social Security law; it will never dare propose abandoning Federal regulation of stock markets and security exchanges; it will never go on record in favor of ending the effort to abolish slum evils; it will never openly oppose the sincere Democratic effort to secure for the workingman a fair share of the bountiful wealth of this country.

Those great policies I have just enumerated, my friends, are Democratic policies. But they are more than that—they are American policies. They had their birth in that spirit of fair play and equal justice which is an essential part of the national character. This country is big enough to provide a fair standard of living for everybody without penalizing any group or class, and that is the constant objective of the administration now in power.

The purpose of government, and its only legitimate purpose, is to maintain and, if possible, increase the contentment and prosperity of citizens generally. The task for which the Roosevelt administration was originally placed in power was to halt the downward spiral of business, decrease unemployment, substitute hope for despair and not only get the wheels of industry moving again but to take such steps as might be necessary to prevent any future return of such complete economic collapse as we had from 1929 to 1933.

As I said before, the success of any administration is dependent on the kind of government that administration has given the people. If it has satisfied the people, the party in power is continued in power. If it has failed, the people put another party in power, as they did in 1932, after President Hoover had shown his incapacity to meet a grave emergency.

You do not need to take my word for the difference between conditions now and things as they were when Franklin D. Roosevelt came to the White House. Just before coming out here I noticed in the New York papers a page advertisement of your Detroit Free Press. It had a chart illustrating the progress of its circulation since 1933 to the present time. Let me quote you a line or two from that advertisement: "From the low-water mark of the depression in 1933 the weekday circulation of this newspaper has had an increase equivalent to the number of families in a city the size of Indianapolis, Ind.; Rochester, N. Y.; or Louisville, Ky." I have omitted the actual figures, but there are few such accurate barometers of an economic trend equal to the circulation figures of a newspaper. This particular journal has been the reverse of friendly to the Roosevelt administration. Consequently, I assume that it attributes its prosperity today compared with what it was "at the low-water mark of the depression in 1933" to its own excellency, and, of course, accords no credit for that prosperity to the administration. But we all know that such indexes are contingent upon and resulting from a general wave of recovery.

You have three great industries in your State—agriculture, mining, and manufacturing. Let us see how these industries have fared since the advent of the present administration in Washington. I see in a quotation from the Michigan Farmer that "Following 4 years of consistent and very substantial gains in farm income for Michigan farmers, the bumper crops for 1937 will place rural Michigan in an outstanding position to purchase the products of industry." The same story narrates that so far this year farmers' income in Michigan was $21,000,000 more than the same period last year, and last year the farmers made $213,000,000. So, this year we can reasonably figure that Michigan's farmers will have $100,000,000 more to spend than they had in 1933.

Of course, the prosperity of any one element in our economic system is reflected in the other elements. I do not have to tell you about your motor industry, but perhaps it may be news to some of you that four times as many new automobiles were registered in Michigan last year as were registered in 1932. The 250,000 additional new cars and tractors tell where a substantial amount of the farmers' money was spent.

Iron-ore mining in your State increased from 2,555,000 to 9,178,000 long tons, or 259.2 percent, from 1932 to 1936.

In 7 years there has been in Michigan a 75-percent gain in employment in your factories, and the amount of money represented by those pay rolls has increased 106 percent. In this State alone 200,000 recently jobless men have gone to work. This, of course, means that the work folks as well as the farmers and industrialists are participating in the new prosperity.

I have heard some of our political opponents protest that the Roosevelt administration could not claim credit for bumper crops. Of course, Nature only, coupled with the industry of the farmer, gives us bumper crops; but such crops in the past have not always been reflected in increased income. It is the prices they get for their products that really count. They were getting 45 cents a bushel for wheat in 1932 against more than double that today, and corn and oats, potatoes, and all the other food products followed pretty much the same percentages. Where they were getting less than $4 per hundredweight for beef cattle in 1932, they are getting about $8 now; and where they got $3.65 for hogs, the market rate is today more than $12. Now, what do you suppose brought about the change; was it not the policy of the National Government which, while making the farmers again a class capable of buying and paying for the products of industry, also gave the city dwellers the purchasing power to buy the stuff the farmer raises?

It is true that a lot of money was spent and is being spent in direct relief and emergency employment, which to some extent has helped in establishing the markets. Our mournful adversaries never tire of pointing out the extent of this expenditure. One would think from their wails and groans that the money had been loaded on scows, towed out to sea, and dumped into the depths of the ocean. Actually, of course, this money went into the arteries of trade, into pay envelopes. A lot of it is represented in the bank deposits and in investments that those bank deposits made possible. It was not wasted and is still working to the benefit of our whole economic system. Without it we would have had a picture very different from that presented today.

All of you can remember the miles of idle factories, the armies of jobless men, the crashing banks, and the business failures of the period of the depression. Do you think that any price was too great to pay for freeing this country of the horror of that time?

I have not attempted to give you anything like an adequate picture of the prosperity that has been reborn in this country. For the whole country is faring just about as well as Michigan. I haven't time to talk about what the C. C. C. camps have done for your State—I mean what they have done in addition to preventing thousands of boys becoming tramps and in building up their mental and physical strength, until nowadays the alumni of the conservation camps are in demand by employers everywhere. Instead of being an alarming liability, these young men have become a great asset to our Nation. I haven't time to talk about the protection of your forests, steps taken to prevent soil erosion, or of the many new public buildings and miles and miles of good roads that have come to you as a byproduct of the processes of the recovery.

These evidences are all about you. And, incidentally, these evidences are the foundation on which I base my political prophecy of long-continued Democratic success in Michigan and elsewhere. In the last analysis the people base their estimates of administrations on what those administrations have accomplished for them. The average man knows little, and perhaps cares little, about the machinery of government. What he looks for and what he expects is results. The statistician's figures give you the technical measurement of what an honest and intelligent administration has done for the country. But every man who looks into his bankbook or into his pay envelope nowadays needs no chart from the economic engineers to estimate the progress our Nation has made since Franklin D. Roosevelt came into the White House.

In the work that has been accomplished during the past few years, the administration has been fortunate enough to have the loyal support of Democratic Members of Congress from Michigan, including that worth-while legislator PRENTISS M. BROWN, who is now doing a capable job as a Member of the United States Senate.

And perhaps before closing I should mention the other Senator from Michigan, Mr. ARTHUR H. VANDENBERG, who has projected himself into the public eye of late by a series of thundering statements which have been startling in the extreme, even if they have not been wholly convincing.

Of all the G. O. P. spellbinders who are busily engaged in the current game of warding off imaginary dangers to the life of the Republic, the senior Senator from Michigan easily leads all the rest. He can warn the country against more dangers that never have happened and more dangers that never will happen than any man now in public life. Just at present he is engaged in defending American institutions against what he calls the dangerous tendencies of the Roosevelt administration—apparently unaware of the fact that President Roosevelt has done more to secure the economic and political rights of millions of underprivileged Americans than any man in our times.

The other night, the Senator undertook to answer the Constitution Day speech of the Chief Executive, in which the latter said that he will continue to consider the Nation's organic law as a noble charter of human liberties. This great speech, which millions heard and understood, was immediately interpreted by this critic as some kind of a subtle and subterranean attack on the people's basic liberties.

Speaking of liberties, suppose we review Senator VANDENBERG'S own record for a few moments. He is no newcomer to national life. On the contrary, the Senator was a congressional leader and a White House adviser during that dismal period when Mr. Roosevelt's predecessor, Mr. Hoover, was being tossed and buffeted by an economic upheaval which he could neither understand nor alleviate. Yes; during that grave crisis your eminent Senator, Mr. VANDENBERG, occupied his customary chair on the Republican side of the Senate, sitting there, mute as a mummy, while farmers were being swept into peonage, workingmen were being thrown into the bread lines, bank depositors were being carried to ruin, and home owners were watching the roof disappear from over their heads. He had nothing to offer, or, if he did, no one recalls what it was. Your Senator sat there through all that—except, of course, when he was called to the White House for a grave and significant conference with Mr. Hoover. And, my friends, can you recall the results of those conferences? Do you remember the cheering statements that came forth instead of the kind of sturdy action which the country needed?

Let me assure you that if the United States had to suffer the same kind of leadership during the past 5 years that it was compelled to endure during the period when Senator VANDENBERG was an intimate White House adviser, then no human being could venture to say what kind of deplorable condition this country would now be in. Why, my friends, how much liberty do you suppose would exist in this country today if that kind of paralyzed leadership had continued?

It is commonly said by the colleagues of Senator VANDENBERG that he has aspirations to move away from Capitol Hill to the other end of Pennsylvania Avenue. Only last year he exhibited rare tact and discretion by evading the Republican nomination for President, and thus avoided the fate of the unfortunate candidate who took the job. But the Senator apparently thinks the future may be different.

In a recent address here in Michigan, he rose to the heights of patriotic generosity by issuing a blanket invitation to all Democrats who disagreed with the administration on certain policies, to abandon their Democratic associations and to become a sort of trailer to the Republican band wagon. In fact, he went further, by predicting that this realinement is inevitable. This magnanimous offer of the Michigan Senator to absorb half of our own party in order to advance his Presidential aspirations was broadcast across the entire country, and it met with a prompt and unanimous response—unanimous against. So far, not a single Democrat has revealed a desire to hop on the Senator's band wagon, and even his own Republican colleagues mournfully reminded him that they tried coalition in last fall's election, and look at the result.

In the session of Congress just ended some Democratic Members of Congress differed with President Roosevelt on certain policies. Only the people can say whether the Chief Executive or those individual Members of Congress came closer to expressing the popular will. But I wish to emphasize that when next year's election rolls around, the Democratic National Committee will be working with might and main for the election of all Democratic candidates and the defeat of all their opponents.

We Democrats have had a few differences of opinion, but we are going to find the correct answer at our own council tables. The assumption of Senator VANDENBERG that because they disagreed with President Roosevelt on one issue Democratic Senators are going to follow him into a bankrupt political organization that

doesn't even know the United States is living in the twentieth century is too absurd for words. Of course, the Republicans have no disagreements, because they have no policies and no program. But if they should evolve a definite program, the resulting split between conservatives and progressives in the G. O. P. ranks will make the differences in our own party seem like nothing at all.

Senator VANDENBERG'S magnanimous offer to join with his Democratic colleagues by swallowing them is simply another meaningless gesture on the part of desperate Republican leaders who are still groping about in political darkness. We intend to hold our lines intact, and as long as we do, there is no doubt about the outcome.

The outstanding Democratic achievements of the past 5 years are the foundation stones of our present enviable condition.

In the midst of a world trembling with war fears, over a period during which revolutions raged and governments tumbled, the United States has enjoyed a period of peace and a sense of security found nowhere else on earth. This has not come about by chance. It is due to the circumstance that we had at the top of our Government a clear-headed, deep-thinking, courageous man, who brought to his task of government a determination to meet the country's problems. Fortunately, he had the wisdom to see what had to be done and the fearlessness requisite to travel unknown paths. He never evaded a problem because it was difficult or because it was dangerous. He is giving to the country the best that is in him, and the country knows this and appreciates it. And so I assure you, my hearers, that as long as the Democratic Party gives the people such a government the people will continue that party in power.

Pennsylvania Beginnings in the Colony of New Sweden

EXTENSION OF REMARKS

OF

HON. JAMES J. DAVIS

OF PENNSYLVANIA

IN THE SENATE OF THE UNITED STATES

Tuesday, December 7 (legislative day of Tuesday, November 16), 1937

REMARKS OF SENATOR C. HALE SIPE IN THE STATE SENATE OF PENNSYLVANIA ON APRIL 13, 1937

Mr. DAVIS. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD the remarks of the Honorable C. Hale Sipe before the Pennsylvania Senate on April 13, 1937, on the subject Pennsylvania Beginnings in the Colony of New Sweden. This is an excellent and authentic account of the important part which the colonists of New Sweden had in the development of the principle of religious liberty. It is an achievement of interest to all liberty-loving Americans, and a credit to the Viking blood from which it came.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

[Remarks of Senator C. Hale Sipe, of the forty-first district, Butler and Armstrong Counties, upon introducing a resolution of Senator Stiefel and himself in the State Senate of Pennsylvania on April 13, 1937, calling for the insertion of a chapter on the colony of New Sweden in the Pennsylvania Manual]

NEW SWEDEN'S HISTORY IGNORED

Mr. President, may I take a few minutes of the senate's time to express some clear and definite thoughts on the resolutions introduced by Senator Stiefel and myself calling for the insertion in the Pennsylvania Manual of a chapter on the first settlements, the first courts, and the first statehouse in Pennsylvania—in other words, a short chapter on the history of New Sweden, founded here on Pennsylvania soil before William Penn was born?

This subject, like all other matters relating to early Pennsylvania history, is very dear to my heart. Naturally so. My ancestral roots run back in Pennsylvania soil to New Sweden and to a time 28 years before William Penn set foot upon the shores of the Delaware; and in my veins runs the blood of every racial stock that contributed to the making of Pennsylvania.

The colony of New Sweden was conceived in the fertile mind of the most illustrious King that Sweden ever had—Gustavus Adolphus—who, as early as 1624, planned to establish on the shores of the Delaware a Swedish colony in which the laborer should enjoy the fruit of his toils and which should be an asylum for the persecuted of all Christendom. At that time the awful Thirty Years' War was raging in Europe, and so amid its fire and blood and desolation and devastation the great king dreamed his noble dream, planned this noble plan, which, in the providence of Almighty God he was not destined to carry into execution, as he laid down his life on one of the battlefields of the Germanies in 1632.

His daughter Christina, who succeeded to the Swedish throne, carried out the plans of her illustrious father, and in the autumn of 1637 sent two ships, the *Kalmar Nyckel* and the *Fogel Grip*, carrying Swedes and Finns to the western world. These ships arrived on the banks of the Delaware in the early part of April 1638, and thus the colony of New Sweden was founded.

FIRST STATE HOUSE IN PENNSYLVANIA

Here on Pennsylvania soil this ignored and forgotten colony made the first settlements in the Keystone State, and the able Swedish Governor, Johan Printz, one of the most admirable characters in early American history, established the first permanent seat of government in Pennsylvania, erecting, before William Penn was born, a statehouse that stood for 160 years.

EXCELLENCIES PLEAD WITH ANGEL VOICES

The colony of New Sweden had many excellencies which, in the language of Shakespeare, "plead like angels, trumpet tongued, against the deep damnation" of ignoring the high spots of the history of this colony in any history text used in the public schools of the great Keystone State.

I do not have time to enumerate all of these excellencies, but let me call your attention to three of them, as follows:

(1) There was no slavery in the colony of New Sweden. Hence it is not strange that at a later day there was issued in Pennsylvania the first protest against slavery on the American continent, although many so-called educated Pennsylvanians seem to think that the agitation against slavery began in New England among the templed hills of the Puritans.

(2) In the colony of New Sweden was established the first Indian policy in Pennsylvania—a policy of treating the Indian like a human being instead of like a wild beast, a policy of purchasing land from the Indian and not taking it from the aborigines by trickery, intimidation, and force. This was the same Indian policy for which William Penn became renowned at a later day. I do not intend to be understood as attempting to detract one iota from the fame and renown of William Penn in the eternal pages of history, but the great truth of history is that the same Indian policy that he followed and for which he was famed was established here in Pennsylvania by the Swedes before the great Quaker was born.

PRINCIPLE OF RELIGIOUS LIBERTY

(3) But the third and greatest excellency of the colony of New Sweden—an excellency that pleads with angel voice against the infamy of ignoring the high spots of its history in the textbooks used in Pennsylvania schools—is the fact that the Swedes planted in this colony the precious principle of religious liberty. You will note that I say "principle of religious liberty," for full religious liberty as it exists in the United States of America in 1937 did not exist anywhere as early as 1638.

I reiterate that the Swedes planted this precious principle in this colony on Pennsylvania soil, in a place where, in the providence of Almighty God, it was not strangled to death as it was in many other places in early America, but enjoyed an uninterrupted growth from the time of its planting.

This principle, I repeat, flourished on Pennsylvania soil before William Penn was born. By the time the great Quaker was 10 years old, there had been 11 expeditions from the homeland to New Sweden; and when he came sailing up the majestic Delaware to found his province, he passed five Swedish Luthern churches on the way—a God-fearing population that had all the virtues of the Puritans without their bigotry and intolerance.

William Penn gave this principle of religious liberty, planted here before he was born, such a majestic impetus that Pennsylvania soon became an asylum for the persecuted of every sect and of every creed. Wave upon wave of English immigration, of Irish immigration, of Scotch-Irish immigration, of German immigration, of French Huguenot immigration, of Welsh immigration, broke upon the shores of the Delaware.

Religious liberty was the magnet that drew these racial stocks with their different creeds to Pennsylvania, thanks to the Swedes and William Penn.

I do not mean to say that Pennsylvania was the only place where the principle of religious liberty was planted in early America. There was a great deal of religious liberty in the Colony of Rhode Island, founded by Roger Williams after he had denounced the theocratic form of government of the Puritans, after he had denounced their doctrine of the union of church and state, and was thrown out because his ideas were in advance of theirs.

Thanks be to God, the principle of religious liberty was not strangled to death in Rhode Island. It flourished there from the beginning, but Rhode Island was small. There was not a large migration from that Colony carrying this principle into the rapidly developing country as there was from Pennsylvania.

There was considerable religious liberty in New Jersey, founded along liberal lines by English Quakers, but this principle met an unhappy fate at the hands of those of Puritan sentiments. There was a great deal of religious liberty in Maryland, founded by the great English Catholic Lord Baltimore, but the same thing happened in Maryland that happened in New Jersey at the hands of those of Puritan sentiments. In other words, the noble plan of Lord Baltimore was wrecked. Alas for his noble dreams!

Then, as time went on, the Established Church of England was set up in many of the Colonies.

PENNSYLVANIA'S GRAND CONTRIBUTION

In order that you may see how largely religious liberty in the United States came out of Pennsylvania, let me call your attention to the fact that at as late a date as the close of the Revolutionary

War, there were only 3 of the 13 States that did not abridge religious liberty to the extent of having a State church. One of the three was little Rhode Island, where the principle of religious liberty was planted at the beginning and was not strangled to death. A second was little Delaware; but keep in mind that little Delaware, up until the Revolutionary War, was part of Pennsylvania. The third was great big Pennsylvania.

Keep in mind, also, that at as late a date as the time of the adoption of the Constitution of the United States, there were still 5 of the 13 States that abridged religious liberty to the extent of having a State church. I think you will agree with me that the Constitution of the United States does not forbid the States to establish State churches if they see fit.

But this principle of religious liberty, planted in Pennsylvania by the Swedes and given a majestic impetus by William Penn, was working all the time; and so it was not long after the adoption of the Constitution of the United States until all of the States got rid of their State churches except one—Massachusetts. It took Massachusetts, cradle of religious bigotry and intolerance in America, more than a generation after the adoption of the Constitution of the United States to get rid of its State church.

Keep the above facts of American history in mind and then you can see how largely this most beautiful jewel in America's crown, this most precious gem in America's diadem of beauty, religious liberty, is a Pennsylvania contribution having its source in the, until now, ignored and forgotten colony of New Sweden.

NOTE.—Those interested further may refer to Dr. Amandus Johnson, The Swedish Settlements on the Delaware (2 vols., Swedish Colonial Society, 1911); Henry D. Paxton, Where Pennsylvania History began (Swedish Colonial Society, 1926); Israel Acrelius, A History of New Sweden (translation by Historical Society of Pennsylvania, Philadelphia, 1876).

Congressman Houston Hopes That on Thanksgiving Day, 1938, We May Celebrate a Peace Amendment as a Part of the Constitution

EXTENSION OF REMARKS
OF
HON. LOUIS LUDLOW
OF INDIANA
IN THE HOUSE OF REPRESENTATIVES
Monday, December 6, 1937

Mr. LUDLOW. Mr. Speaker, JOHN M. HOUSTON, of Kansas, is a fine type of citizen and patriot, who believes that in America the people should rule, not only in the ordinary and commonplace decisions of life, but also in those major and tragic decisions which involve the sacrifice of their loved ones in foreign wars.

The cause of peace has no better friend than Mr. HOUSTON, which may be explained in part by the fact that he knows so much about war. He had a very active career as a marine during the World War from June 1917 until May 1919, serving during 8 weeks of that time as honor guard for President Wilson.

Mr. HOUSTON, who is one of the outstanding veterans of the House of Representatives, believes that the decision as to whether the United States shall enter foreign wars should be made by the people in a referendum vote, because the people have to do the dying and the suffering and to bear the unspeakable burdens and costs and griefs of war. He believes in adequate national defense and protection from invasion, but when it is proposed to send our boys away to be killed in China or Japan or some other distant part of the globe he can see no reasonable argument against allowing the people to decide the question. With many other veterans, both inside and outside of Congress, he is supporting the peace amendment I have introduced, House Joint Resolution 199, which proposes to give the people a right to vote on participation in foreign wars, except in the case of attack or invasion, and I wish in this public way to acknowledge my indebtedness to Mr. HOUSTON for his valuable assistance, his sympathetic interest, and wise counsel in promoting this worthy peace measure.

By unanimous consent of the House, I present herewith for the RECORD an article written by Mr. HOUSTON for the Wichita Beacon under date of November 26, 1937. The article is as follows:

The chief event of this week was the celebration of Thanksgiving Day, and during these troubled times of business recession, grave international situations, and discussions of perplexing economic problems, it is fitting that a day was set aside for the purpose of giving thanks to Almighty God for the blessings bestowed upon us.

In my opinion, the greatest blessing we are enjoying today is that of peace with all nations. Whether this special session of Congress results in the formulation of a farm program or a wage and hour law or any other suggested measures, it will have accomplished much if it only serves to give notice to the world that we are a peace-loving people, unwilling to join in any conflict that is not brought to our very doorstep and determined to stay that way.

To those of my constituents who are so intensely concerned over the threat of war, and there are many of them as my daily mail contains scores of appeals that everything possible be done to prevent this country from becoming embroiled in foreign conflict, I commend for reading the CONGRESSIONAL RECORD of November 22.

During the Seventy-fourth Congress, I was among the first to sign discharge petition No. 11 in order that the Ludlow peace amendment might be brought before the House for discussion and vote. The proposed amendment to the Constitution provides that the authority of Congress to declare war, except in the event of invasion or attack, shall not become effective until confirmed by a majority of all votes cast thereon in a Nation-wide referendum.

There are now 189 of the required 218 signatures of Members of the House on the petition, and I am hopeful the other 29 may be obtained before Christmas.

Congressman LUDLOW, of Indiana, on the date mentioned above, made an impassioned plea for support of his amendment, and for those who do not have ready access to the RECORD, I quote some of his statements, to which I subscribe 100 percent. Mr. LUDLOW is known as the pioneer in the fight to insure the right of the common people of this country in having something to say as to whether the United States shall enter foreign wars.

He said, "The sentiment for the proposal has grown by leaps and bounds, and lately it has found reflection in a striking way in another branch of Congress where, within 1 week, three distinguished Members have introduced substantially the same proposal that I have been advocating these 3 years, and two of them have done me the honor to lift sentences bodily from my resolution.

"A demand for the right to vote on sending our boys into foreign slaughter pens is ringing through every State in North America, and it has reached the throne of power in Washington, and we who sit on the throne of power are asked in the name of humanity to amend the Constitution so that those who have to do the dying and the suffering and to bear unspeakable burdens and griefs of war shall have something to say about entering foreign wars. What little confidence they had left disappeared the other day when they read how the United States was beguiled by European intrigues during the World War and how the World War Allies were secretly pledged in advance to a division of territorial spoils—a pledge that has been kept in the dark for 20 years, with good old honest Uncle Sam not having the least suspicion of it.

"The only tenable argument ever made against the plan for a referendum on foreign war is the time required to take a referendum which it is claimed might give an enemy nation the advantage. That was valid argument in 1837 but not in 1937."

Admiral McGowan, an officer of the World War, said, "The United States has long since graduated out of the stagecoach and pony-express class, and there is no reason why in this day of railroads and airplanes and telegraph and telephone and radio we could not refer the question of war or peace to the people of the country and have their answer back within a week—indeed, within 48 hours, if absolutely necessary."

I concur in these statements, and it is my earnest hope that long before another Thanksgiving Day rolls around, the Ludlow peace amendment will be a part of the Constitution of the United States.

What Hopes for Housing?

EXTENSION OF REMARKS
OF
HON. EVERETT M. DIRKSEN
OF ILLINOIS
IN THE HOUSE OF REPRESENTATIVES
Monday, December 6, 1937

Mr. DIRKSEN. Mr. Speaker, housing is in the spotlight. After a succession of abortive efforts, it is hoped that millions of homes and apartments will spring full blown upon the landscape to help offset the present industrial recession and give stimulus to the heavy-goods industries. What hope can be honestly entertained that this will come to pass? What hope that cozy white cottages, ivy-covered bungalows, sedate two-story structures, and streamlined apartments will spring up to create jobs, and develop markets for sand and stone, bricks and blocks, lumber and lath, cement and steel? The

answer is important. It may save disillusionment. It may give better direction and emphasis to a housing program.

Despite the allurements in the bill now pending before the House Committee on Banking and Currency the prospects in the field of new housing are not roseate. This measure proposes lower interest and service charges on mortgages, larger mortgage guaranties, low mortgage insurance premiums, expansion of the class of structures eligible for mortgage insurance, easing the capital requirements for mortgage associations, and renewal of a program of modernization.

What are the conditions which discourage hope of substantial advances on the new housing front?

First. Estimates of housing shortage are after all but estimates and may be seriously overstated. Experience on the bondholders committee indicates to me that we were seriously overbuilt in the halcyon days of 1926 to 1929. Builders and promoters now have numbers of homes for sale. Realty managers will affirm the statement that there are many vacancies. Some builders and developers are now attempting to sell homes on the basis of "nothing down" with little success. Experienced builders and developers anticipated a building boom in 1936, built and advertised homes, found buyers afraid to undertake a long-term debt because of the insecurity of their jobs, and ultimately took losses on these homes. They are not so likely to venture into speculative housing again until conditions become more stable.

Second. While money is abundant and rates are reasonably cheap, housing money is timid. Investors in real-estate paper remember so vividly the deflation in real-estate bonds that began after the crash of 1929. The Sabath committee, of which I was a member from its inception, saw how billions in real-estate values were washed out, and obtained a rather complete picture of the spoliation of the life's savings of millions of people. The lesson of 1929 and the years following, will not soon be forgotten, and money, while abundant, still remembers that over financing was at the root of the trouble.

Third. We are in a business recession. Building invariably declines during a business set-back. A recession means curtailed production and unemployment. It means lack of confidence. Is it logical to expect much building expansion when production is on the decline?

Fourth. Residential construction will be determined by the number of available buyers of properties. Despite the easing of interest and carrying charges, how can prospective buyers be induced to obligate themselves for a fixed monthly installment for a period of 12 to 18 years when sustained and continuous earning power is so precarious?

Fifth. Rental construction will be determined by the margin of available renters who can afford to pay rents in new structures, built at costs that are comparatively excessive. How shall they be induced to move from where they are to houses, duplexes, and apartments that command higher rents? And if they can be induced to move, what shall become of the vacated structures and the investments which they represent.

Sixth. That suggests an aspect of housing that has been wholly underemphasized. Go into any municipality, large and small, and see for yourself houses that are badly in need of repair. Many of them are weather beaten slatterns that serve to blight the very area in which they are located. They represent an investment in land and buildings, sewer connections, electric and gas facilities, and other services have been installed at considerable cost. Shall these investments be junked and shall these old structures be permitted to continue in their present state of disrepair or shall these values be preserved and those structures rehabilitated?

Rehabilitation offers a tremendous field. A single mossy old house can blight an entire block and diminish values. A sufficient number of such houses can despoil the attractiveness of a whole city and give it a dour and forbidding appearance. It can and does have a depressing effect on the temperament of the people. Such old structures with defective wiring, broken plaster, defective flues are fire hazards. They are costly to insurance companies, and to taxpayers generally, in the form of higher insurance rates and the necessity for maintaining greater fire-fighting facilities.

People live in such structures. They remain there because it represents what they can afford to own or for which they can afford to pay rent. With moderate expenditure, they might be induced to repair and rehabilitate these homes and still be able to continue their ownership or their capacity to pay rent. To remodel and rehabilitate such homes would require labor and material. To stimulate jobs and increased use of heavy materials is, after all, the function of a housing program. Then why not emphasize this aspect of a housing program and keep it divorced from some of the unfortunate provisions that crept into the earlier modernization program of the Federal Housing Administration, which permitted purchase of household appliances and equipment on long-term installment financing and saddled the Government with a generous amount of uncollectible installment paper. Let it be a home-improvement program in the strictest sense of the word.

Cities and States could contribute much to such a program by means of rigid and careful inspections of old properties from the standpoint of fire hazards. They could make definite recommendations as to what is needed to make such old structures comply with State laws and city ordinances.

Cities might also test out a suggestion for a nuisance tax. So many squalid old structures are occupied by renters in the lower income brackets who are not only constrained by economic necessity to live there, but who are in no position to bargain with the owner or landlord for necessary improvements. It might be within the province of States and cities to impose a nuisance tax upon such structures, not for the purpose of raising revenue but as an incident to inspection and fire hazard and as an incentive toward keeping such places in a decent state of repair. This offers interesting possibilities in dispelling much of the wretchedness that now exists.

Finally, proper emphasis on old housing will curb the tendency to jump over intermediate city areas to develop new additions and thus blight these intermediate areas. Go to any large city and note how areas once served by streetcar service, sewers, sidewalks, water mains, gas mains, and other utilities have been blighted as developers go miles beyond and lay out new additions. Yet the tremendous investment in car trackage, water and gas mains and sewers must be maintained without adequate revenue from these blighted areas, and in addition, facilities must be expanded to serve these outlying areas. This is one of the tragedies of our cities. Blighted areas, blighted investments, delinquent real-estate taxes, destruction of that compactness that should be the characteristic of any well-planned city, high taxes, fire hazards, unsightliness—these are the very price we pay for hit-and-miss planning and housing development.

Emphasis on old housing rehabilitation now might go far to set in motion a program that will cure these evils and give proper direction to the growth and complexion of our cities. It is worth a trial.

The South Is American

EXTENSION OF REMARKS

OF

HON. WALTER CHANDLER

OF TENNESSEE

IN THE HOUSE OF REPRESENTATIVES

Tuesday, December 7, 1937

ADDRESS OF HON. WALTER CHANDLER, OF TENNESSEE, AT THE FIFTY-SECOND ANNUAL DINNER OF THE NEW YORK SOUTHERN SOCIETY, NEW YORK CITY, DECEMBER 3, 1937

Mr. CHANDLER. Mr. Speaker, under the leave to extend my remarks in the RECORD, I include the following:

Mr. Toastmaster, fellow guests, members, and friends of the New York Southern Society, you are exceedingly kind to applaud before

you know what is coming, and I have no doubt that, as true southerners, you wish to encourage me in the difficult role which I am to act as understudy of the distinguished Member of Congress from Texas, the Honorable HATTON W. SUMNERS. And let me hasten to assure you that I genuinely need that applause.

Whatever may be said in extenuation of my appearing here in the place and stead of the beloved chairman of the House Judiciary Committee, you must admit that I am not lacking in temerity, or I probably should say more bluntly, nerve, in attempting the impossible feat of doubling for my chief on the committee.

The toastmaster has been most courteous in his introduction, and aside from the explanation of Mr. SUMNERS' absence, I am flattered to think that he has used in introducing me some of the compliments that he intended for Representative SUMNERS. In fact, I was rather apprehensive that I might find myself in the position of the man who was sent to fill in at a dinner in a strange community and arrived just in time to take his seat for the address. The story is old, but I have just felt the sensation. The toastmaster rose and rather exuberantly read that, "Our speaker this evening is known across this broad land from the cold and barren peaks of Maine to the ever-normal utopia of California, and from the deep blue waters of the Great Lakes to the gorgeous hues of heavenly Florida" (I almost said "gorgeous hussies" accidentally, but I would not want to give Florida any advantage over California, or vice versa); "a man whose name is a household word at every American breakfast table, and is spoken affectionately by the children, and cherished in the hearts of the aged," and when he started to read the name of the original speaker he suddenly remembered that a substitution had been made, and in the excitement of the moment he turned to the new speaker and said, "What in the h—— did you say your name was?"

Perhaps, after all, it is better that I am unknown, but I am proud to tell you that I am a southerner, born in the far South, and never crossed the Mason and Dixon line until over 21 years of age.

Indeed, the two gentlemen whom you chose as your guests of honor this evening, Mr. JONES and Mr. SUMNERS, and I were all born in the Volunteer State of Tennessee—a truly southern State but intensely American in temperament and sentiment. Mr. SUMNERS has requested that I express his very deep regret that a cold contracted several days ago put it beyond his power to leave Washington. He had looked forward to this evening and would be here if it were within the bounds of reason. I know whereof I speak, because I have watched him with the eager hope that he might improve (thereby saving you from this visitation by me) and gratify his earnest wish to speak to you who have come to New York from our own Southland and who have preserved your loyalty and your affection for the old home.

But Mr. SUMNERS' loss is my gain, and I now express my own pleasure in being with you on this delightful occasion, made more delightful by the presence of the charming ladies who picture the South at its very best.

Fifty-two years have passed since this society was organized—more than one-third of the time since the American Constitution was adopted and the half century during which the most astonishing progress has been made in all of the geographical sections of America. I say geographical because the South admirably has become only a geographical section and not a political section.

The men who formed this society must have done so under the deep sense of obligation to keep alive the history and the sovereignty of the South. They must have been nurtured in the cradle of the Civil War and reared in the tragic era of reconstruction. They, like the ancestors of those who gather here this evening in that same spirit, must have suffered as everyone did in the great American war, but they must have believed fervently in the sentiments of their chieftain in the field when he said, "There is a true glory and a true honor—the glory of duty done, the honor of integrity of principle." The War between the States was over; they had sworn allegiance to a reunited country, and they wanted to go forward with it in peace.

1885! How singularly some of its events parallel the present year! The Democratic Party had overcome the Republican host, and Grover Cleveland occupied the White House. Perhaps that might account in a small way for the courage of the framers of this society to come out boldly with this organization. Regrettably, there was stagnation in business, and self-preservation might have been the actuating cause of the Southern Society's formation. But, after a recovery in the price of wheat, confidence returned to the country, and the railroads showed signs of activity, along with the iron trade.

The diplomatic annals of that year were filled with a dispute over the partition of the outlying regions of the earth, and China was engaged in a cruelly conducted, unofficial war, then with France. In that same year the Statue of Liberty was presented to the United States by that same Government of France. The growth of national feeling asserted itself afresh, and, happily, a reunion of the Blue and the Gray took place on the battlefield of Gettysburg.

Today, my friends, I believe that national feeling has grown to its full height. There may be a few secessionists scattered here and there, but I am sure that they are not in the South. Her people are deeply grateful for the glorious privilege of sovereignty in an indivisible Union of self-governing citizens. We have our internal contentions, and sometimes emulations, as to who can best govern and best achieve, but the South is American.

Quite naturally we feel at liberty this evening to speak well of ourselves as southerners, and I admit that we are more forgiving and more tolerant than those of our fellow citizens who have dwelled in northern latitudes. I am quite certain that we forgave the North for succeeding in the Civil War before they forgave us for failing in it. And today we are more tolerant and forgiving than ever; we can afford to be. Men from the Southern States again occupy high places in the councils of the Nation. A very dominating deer hunter from the Lone Star State of Texas is Vice President of the United States and is popular everywhere. The outstanding Secretary of State, whose light shines brilliantly over the world, is not only a southerner, he is a Tennessean. The Secretary of the Navy and the Secretary of Commerce are southerners, as are two members of the Supreme Court, and the South is proud to claim as one of her great men your guest of honor this evening, Mr. Jesse H. Jones. Twenty-five of the forty-four standing committees of the House of Representatives are presided over by Congressmen from the Southern States, and of 18 of the 33 standing committees of the Senate the chairmen are from south of the Mason and Dixon line.

The South has fostered and sustained one principle of the American Government that may be disappearing from our national life. It is known as the principle of States' rights, a principle older than the Government itself, but so often departed from as to remain today only a form of protest by political minorities. I grew to manhood in the belief that the doctrine of States' rights was indigenous to the soil of the South and was the battle cry of the Democratic Party. I thought that the principle of a strong central government was the keystone and the arch of the Republican Party—a great national party, by the way, and a foeman worthy of the name. Today the shibboleth has changed owners, and those who, in the fervor of a just cause, often asserted that the rights of the States must and shall be preserved are now in the seats of the mighty; and, in order to remain there, seek the further strengthening of the National Government, and gather unto ourselves the greater problems of the people in the belief that they are National and no longer State responsibilities.

It may be essential that any administration having the responsibility of government must strive for additional powers and functions, partly from the pride of office and civic responsibility, and principally from the sense of high privilege to maintain its own political body in command. What true Democrat, what true Republican does not believe with all his heart that the salvation of the American Republic depends upon the dominance of his own political party? What real southerner would disown George Washington, John Marshall, Thomas Jefferson, and James Madison, and Andrew Jackson, who first said, "The Federal Union, it must and shall be preserved!"

The South has also done its part in aiding in preserving another institution which symbolizes our faith in popular government—the Supreme Court. Those familiar with the decisions of that tribunal following the Civil War know that the Supreme Court actually protected the inherent rights and liberties of the southern people against the punishment and deprivation that would have been visited upon them by an irate Congress, acting in the heat of passion. We hold that Court in grateful remembrance, and I entertain the feeling that your desire to honor Mr. SUMNERS this evening is partly in recognition of his recent and splendid contribution toward the payment of that debt of gratitude.

My friends, the fusion or confusion of political principles has dulled a great body of our best equipped citizens into the forgetfulness of one prime obligation of an American—the individual responsibility of each citizen to take a personal part in the government of our Nation. This is a nondelegable duty and is becoming more personal with the rise of democracy. We still live under a republican form of government, but the word "democracy" has increased in use so rapidly that we rarely hear the word "republic" mentioned. If ours is a democracy, how can anyone maintain his self-respect and his love of country and allow someone else to discharge his civic obligations?

Democracy means not only self-government, but also self-support, self-reliance, self-confidence, and self-discipline. Multitudes of American people must be educated politically, and who shall do it? Those who love our country, or themselves best?

The States still have their duties and their functions; the States of this Nation are still sovereign and of equal dignity. The glory and the greatness of the South are not only of the past. We who love best the strains of Dixie and who hail from a portion of the country that is still 80 percent Anglo-Saxon have a challenge to meet and a charge to keep. We have seen the milk of human kindness turned into the wormwood and the gall of hatred, and America must not attempt now to settle her common problems in bitterness. We must ever remember that the Americans of the North, the East, and the West are of the same blood that we are, they have the same language, they are of the same political principles, they have our love of liberty and our aspirations for their own success and for the success of the Nation; we must not forget that, as the American people so magnificently demonstrated 20 years ago, when a common enemy appeared, North and South and East and West all joined hands and hearts to work and serve and fight and die for America.

"We the people" are prone to justify our apathy by maintaining that the responsibility for the general welfare rests on the Executive, on the Congress, and on the courts, but you and I know that the ultimate safety of our democratic institutions does not reside

with any legislative body, executive officer, or judicial authority. It depends on the whole body of patriotic, ambitious, liberty-loving American people who want to understand and practice the ideals, principles, and customs of our governmental system, and who are alert and vigilant to hold fast to that which is good for us all. To quote Daniel Webster, "God grants liberty only to those who love it, and are always ready to guard and defend it."

Finally, may I not express a quizzical feeling which comes over me at this time? I wonder if, in this great city, a city which must be a friendly city because there are southern people in it, a city with its canyons and cliffs, its streams of strange faces, and sounds of strange voices and strange tongues, its myriads of lights, and its inescapable shadows, have you who have had the word "success" written over your names in capital letters in the greatest city in the world—have you ever been homesick for the Old South? At the close of a long day in the hurly-burly of metropolitan life, have you ever found yourself thirsting for a drink of water from the old spring on your father's farm? Have you ever yearned, like King David: "Oh, for a drink of water from the well in Bethlehem by the gate?"

You know the feeling. Surely you do, because the man who has never been homesick has never had a home. Once in a while I know you have wished that the coffee would taste as it did when your mother made it; you have wished that Christmas, and the circus, and things generally would produce in you once more the old thrills of delight. Well, just remember that along with the progressive spirit of today, the Old South is still there. The water and the coffee, Christmas, and the circus have not changed, except for the better. The songs of your childhood still come softly "o'er the lea" and "Ole Man River still keeps rolling" majestically to the sea. When you do feel these pangs of nostalgia, and the overwhelming power of sentiment, why not turn your steps homeward, and pay us a visit down South? The latchstring is ever on the outside, and the old-fashioned hospitality awaits you always.

Highway Safety

EXTENSION OF REMARKS
OF
HON. H. JERRY VOORHIS
OF CALIFORNIA
IN THE HOUSE OF REPRESENTATIVES
Tuesday, December 7, 1937

Mr. VOORHIS. Mr. Speaker, the problem of traffic deaths has, I believe, become so serious a menace in America that it merits the attention of the Congress of the United States. Like so many other problems, in this case it seems to me one of the best things we can do is to encourage constructive voluntary efforts on the part of citizens to meet it. For this reason, I ask permission to have printed in the RECORD with my remarks the following self-explanatory letter from one of my constituents, a former traffic policeman, who is making an outstanding contribution to the work of reducing traffic fatalities:

ALHAMBRA, CALIF., *November 26, 1937.*

Hon. JERRY VOORHIS, M. C.,
House of Representatives, Washington, D. C.

DEAR SIR: In answer to your request for data concerning the activities of the Cooperative Safety League of Alhambra, Calif., I am happy to explain our efforts toward making our highways safer ways.

Highway safety, as you know, is a problem embracing not only enforcement of traffic laws but also engineering and education of the motoring public.

The Cooperative Safety League has concentrated its efforts on the educational phase, and, in this respect, we have not only taken cognizance of the Chinese adage, "One picture is worth ten thousand words," but we have taken advantage of the literary principle of appealing to the emotions of our readers by writing the captions of our safety cartoons, Traffic Tragedies, in poetic language.

We find the reading public will, as a whole, read and absorb the message conveyed by a cartoon when they will not read statistics.

The use of poetry is exemplified in the respective speeches of Brutus and Mark Anthony, at Caesar's funeral, in Shakespeare's Julius Caesar. Shakespeare couched Brutus' speech in prose and Mark Anthony's speech in poetry for the obvious purpose of swaying the reader's sympathies in favor of Anthony. We, too, attempt to influence our readers in a similar manner through the rhythmic appeal of poetry to the emotions and the resultant thought that the tragedy might easily be the reader's own loved ones.

Such thought is stressed in the following poem which relates the story of a police officer who answered an ambulance call to find his own 5-year-old son had been killed by a speeding motorist. It is titled, "Jackie, the Son of a Hardboiled Cop."

"You think I'm a hardboiled copper
For writing a mere 'forty-three';*
Well, perhaps I'm thinking of Jackie
And all that the lad meant to me.

"How's that? Tell you all about it?
Well, stranger, the boy was my son.
God! What I'd give to hear 'Daddy'
Once more when the day's work is done.

"The driver was just in a hurry.
He didn't intend any harm,
But the sun and the stars quit shining
When I picked up my boy's lifeless form.

"Well, Mister, I'll tear up this ticket;
I don't want to 'pinch' anyone;
But I'd ride this motor through hell's fire
To protect another man's son.

"So the next time you feel like speeding
Or passing a boulevard stop,
Just pause and remember my Jackie—
The son of a hardboiled cop."

Hoping that our plan may prove of some value to other organizations engaged in a like work, I beg to remain,

Yours most respectfully,

ARTHUR C. RICH.

*In police parlance "forty-three" is an idiom expressing the rate of speed a motorist is traveling.

The Farmer and Free Enterprise

EXTENSION OF REMARKS
OF
HON. SAMUEL B. PETTENGILL
OF INDIANA
IN THE HOUSE OF REPRESENTATIVES
Tuesday, December 7, 1937

ARTICLE IN RURAL PROGRESS MAGAZINE

Mr. PETTENGILL. Mr. Speaker, the courtesy of the House enables me to reprint an article of mine, The Farmer and Free Enterprise, which was published in the October number of Rural Progress. In that form it reached every farm home in Ohio, Indiana, Illinois, Iowa, Wisconsin, Minnesota, and Michigan. The response which came from their subscribers has led the editors of Rural Progress to consent to its republication in the RECORD for a still wider group of readers.

As stated in the article, "There is a legitimate field for Government cooperation with agriculture." I merely point out the present drift toward compulsion and control. Certainly there is a point beyond which we cannot go without the farmer becoming the serf of the State. The article serves its purpose by pointing to the breakers ahead.

The article follows:

THE FARMER AND FREE ENTERPRISE

(By SAMUEL B. PETTENGILL, Member of Congress from Indiana)

Even when times are good, the wise storekeeper watches his credit risks, looks over his insurance policies, and keeps his weather eye peeled for forces that may affect adversely his earnings and his savings. A wise nation will do the same thing. Times are better with us now. No such permanent and drastic changes have been made in our lives and enterprises as have been made in some of the nations of Europe. Now is a good time, therefore, to take stock of the ideas and forces loose in the world which may affect profoundly the nature and future of our business, our industry, and our agriculture.

The world is now divided into two camps. In one camp are those who believe that the future can best be served by a system of free enterprise, with such controls by government as may be likened to those traffic rules which are necessary on crowded streets. In the other camp are those who believe that modern conditions require that the state shall become the supreme dictator of our lives and our enterprises.

Sooner or later all of us must make up our minds about these two camps. The way affairs are moving the world around, there will be no half-way house between these two camps. We shall have to be in one or the other. In which of these camps will the American farmer be most prosperous as a producer and happiest as a citizen? I want, if I can, to strike an honest balance sheet between these two camps as far as the farmer's interests are involved.

How far should agriculture submit its fate to government, to any government, whether conservative, liberal, or radical? Is there

a point to which it should go, but beyond which it should not go, in the matter of government control and direction? If so, can it stop at that point or will events force it to go the whole hog?

What is the "whole hog" to which events might force it? Recently Gen. Hermann Goering, director of Germany's new economic program, gave us a glimpse of the end of the trail. Stripped of its husks of noble words, the nubbin is this: This German farmer is to become the slave of the state. He will do as he is told, live as he is ordered, earn what is decreed by political authority. Berlin will be his boss.

General Goering has said, as reported by the agricultural attaché of our American Embassy in Berlin last April, that the goal of the national program is an increase in the gross production of foodstuffs "even if it involves a decrease in net returns" to the farmer. This means compulsion. It must mean compulsion. Men will not, either in Germany, or in America, work harder and longer to produce more and sell it for less unless they are made to.

Last March, General Goering issued a decree to the effect that the state will appoint a trustee to run the affairs of any German farmer who fails to meet the demands of the national program. If necessary, he suggested, the state will take absolute control of the land, order the owner to stop farming, and rent the land to another farmer. There are no exceptions. This decree applies to every German farmer.

Last June the German Government ordered a nation-wide redistribution of agricultural and, pooling large numbers of small farms into large single farming units, with the idea of making each individually operated farm meet the Government's standard of efficient production. Roland Freisler, State Secretary of the Ministry of Justice, admits that, under this policy, the ancient fact of land ownership can no longer mean what it has meant to the German farmer for generations. "Every German farmer," he said, "knows now that his relationship to the soil he tills is a working relationship, not merely a matter of title. * * * There is no longer any need or any room for an abstract right of ownership of land."

The program calls for official supervision or even replacement of "incompetent farmers" who fail to meet the state's demands. The goal is increased production at all costs. If the "incompetent" farmer stands in the state's way, neither he nor his farm has any rights the state is bound to respect. The state, in short, applies to the farm what is known as the "stretch-out" in industry.

While the State will remove from his farm a farmer who does not please it, the State will not permit farmers to leave farming of their own will. General Goering has said that the "flight from the land" will be treated as an "evasion of responsibility for the national welfare," or as desertion from the Army would be treated. This means, in blunt words, conscripted farm labor. It means the draft in peace as well as in war.

A "farm card" system is to be introduced so that the political authorities can have a "detailed picture of the operation and management of every individual farm." The hidden blackjack in this program is plain. Do as you are told. The German industrial worker, by the way, has a similar "card" which amounts to an employer's blacklist. So many demerits on your "card" and you know your fate.

Perhaps the circumstances of Germany's situation make all this a matter of harsh necessity. I pass no judgment on German policy for German circumstances. But policies and tendencies of this sort are world-wide. You can find them in Russia, in Japan, in Italy, in Mexico. You see them in the agricultural crisis law of 1933 in the Netherlands. We have seen foreshadowings of them in the United States. We remember the compulsory potato bill, the tobacco bill, and the cotton bill of 2 years ago. These three measures were enacted into law, not in Germany, not in Italy, not in Russia, but in America. They have been repealed. But will they return?

It is my earnest hope that we shall meet the very real problems of American agriculture through cooperation rather than compulsion, in freedom rather than serfdom, with the State as servant rather than master.

Leaving out of consideration for the moment all thought of the happiness that free men feel just because they are free, leaving out the fact that, through all history, wherever and whenever the State has taken complete control of a nation's economic life, it has sooner or later gone on to take equally complete control of the education and religion of the people and of all the instruments through which they have expressed themselves freely, let us look at the cold question of whether compulsion by the State is efficient either for the individual or for the Nation. Does compulsion by the State justify itself economically?

Three things limit and, in the end, destroy the efficiency of government when it undertakes to dictate in detail the whole economic life of a people:

First, the men who run governments are not all-wise or infallible. They are, in the main, men of just ordinarily ability. A man is no wiser and his motives no purer after he puts on an official badge than before. And a Federal badge instills no greater virtue than a State or county badge. They make mistakes. And when a mistake or miscalculation is made at Rome, Berlin, or Washington involving a whole people or a whole group of a people, how many more suffer than if the same mistake were made by the same man running his own farm or store?

Second, it is difficult for government officials to make their decisions on the merits and facts alone. Economic questions are likely to get political answers. If one expects a politically appointed Federal Reserve Board, let us say, or any other board under any administration—Republican or Democratic or Fascist or Communist—to clamp down on an expanding and dangerous business boom or enact a necessary tax program preceding or during a campaign, he should have his head examined. Economic questions, I repeat, are likely to get political answers. And in the battle of groups at Washington the group that happens to swing the greatest voting power at the moment is likely to dictate the answer. Witness the fate of agriculture for a half century as it was ground between high tariffs for purchases and free markets for sales when the manufacturer was "in the saddle" at Washington.

Third, when government is boss, fear falls like a blanket over the people. No one dares do anything he thinks a bureaucrat might frown upon. The brains of Russia are today going into retirement because of fear. Everybody waits for orders from above. No one ventures along new lines. With the dead hand of bureaucracy the revolution is strangling its own children. If in the factory a machine or assembly line breaks down, the foreman knows that he may be charged with deliberate sabotage, with Siberia or the firing squad as the penalty. After a Russian train wreck it is hard to tell whether more get killed in the wreck or after it. Sometime ago, before the present blood purges, 35 employees of the commissariat for agriculture, many of them experts in foods, were shot without trial. Their blunder was that they failed to guess right. Under such conditions the worker takes no chances. He plays safe. He makes no experiments. Engineers and inventors and executives refuse to go ahead until plans are approved by the "party" secretary, who probably knows little or nothing about the plan he approves. It is a grim game of passing the buck—to Moscow. The result is industrial chaos.

Free enterprise has not always distributed fairly the plenty it has created, but the totalitarian state, the state that pulls everything in to the center and runs the whole economic life of the Nation with an iron hand, has created no plenty to distribute. In terms of the purchasing power of a day's wages of butter, sausage, beef, or sugar, the workers of Russia, of Germany, and of Italy, where government rules the roost, receive but a fraction as much as the employed American worker received in the worst years of our depression.

If the whole history of the human race means anything, nations become prosperous as a result of being free.

Nothing such as I have described has taken place in America. And pray God that it never will. But we are talking of ideas and trends that are in the air the world around. We know that these influences are at work. Both Fascist-minded and Communist-minded forces are boring from within, especially in our great industrial centers. We hear of more "plans" for more "controls" of more parts of our economic life. We hear of plans for the political "allocation of credit" between capital investment and consumer goods. No new industry, we are told, is to get credit if it proposes to enter the field of an established industry which government considers "overbuilt." May we sometimes see an "overbuilt" industry. one which has political influence and is capable of contributing to the party war chest?

Who is wise enough to decide all these things? Suppose such a system had been in operation when many of the things that now make life livable were struggling to be born. Suppose the phonograph or piano industry, strongly entrenched in Washington, had been able to convince the Government that the industry was "overbuilt" and that the infant radio industry should be throttled. Suppose the wagon and streetcar had, in like manner, stopped the development of the automobile; that natural ice had blocked the refrigerator; that the musician's union had strangled the movietone; that whale oil had prevented kerosene; that natural gas had denied electricity the right to develop. All these are the result of the daring of free enterprise. None are the brain children of bureaucrats. Free men have moved on in search of most and best for least.

What does all this mean for agriculture?

Whatever may be the whole list of factors involved, the immediate cause of agriculture's difficulty has been the loss of markets. There can hardly be dispute of the fact that the loss of foreign markets, at least, has been due in large part to unwise governmental policies—tariffs, war, drastic restriction of immigration, and the like, over a good stretch of time. At any rate, if the disease is lost markets, the cure is new markets, and the long-range solution of our difficulties is finding these new markets for farm commodities, not restriction of our production.

Let the chemist search for new markets in his test tube, and the engineer in his laboratory. Let them be free to dream, to make mistakes without reprisals, to fail, and to succeed. If they can find someone to finance their discoveries or inventions, let no bureaucrat deny them their chance. Let them profit if they succeed. I say this because the future farm is destined, if we keep the track clear, to be a source of raw materials for industry as well as a supplier of food. A hundred pounds of cotton go into every automobile and its tires. Cotton is also used in building cement roads. Goldenrod and milkweed may supplant Brazil as a source of rubber. Slash pine as a source of cellulose and tung oil trees may cover the eroded lands of the South. Paints are being grown on the farm, also paper, synthetic lumber, fiber board, drainage pipes, dyes, perfumes, solvents, resin. Perhaps the greatest possibility is cheap industrial alcohol from vegetable wastes, sawdust, and so on, as a substitute for internal combustion fuels. That secret is still locked in the brain of the inventor and developer, but, if released, it will put millions of unproductive acres to work. The potential industrial markets

for farm products are as limitless as the desires and genius of man.

These new markets must be found. Only free men are apt to find them, to finance them, to take the chance of "losing their shirts" or "making their pile" in the development. Laboratories can do more than legislatures. If government were to spend the annual price of one battleship in aiding research for new uses for farm commodities, Thanksgiving Day might mean more when it rolls around.

I do not wish to be misunderstood. There is a legitimate field for Government cooperation with agriculture. Some Government "controls" may well be necessary. But in the long run, decade after decade, aside from correcting the lack of balance between agriculture and industry caused by manufacturers' tariffs, I am convinced that reasonable interest rates for farm financing, a drastic reduction of the cost of government, lower taxes, and the discovery and development of new markets for farm products will do more for the American farmer than the politicians will ever do.

There is danger in government attempting too much. It may issue promises and encourage hopes that cannot be fulfilled. If faith in government is thus destroyed by events beyond the control of even the best-intentioned public officials, what then? The great enemy of civilization is monopoly, whether industrial, financial, or political. Big government is no more lovely than big business. In essence they are the same.

Let's not put all our eggs or all our liberties in one basket. If we do our children may have neither liberty nor eggs.

Farm Legislation

EXTENSION OF REMARKS

OF

HON. MILTON A. ROMJUE

OF MISSOURI

IN THE HOUSE OF REPRESENTATIVES

Tuesday, December 7, 1937

Mr. ROMJUE. Mr. Speaker and Members of the House of Representatives, President Roosevelt had foremost in mind, when he called this special session of Congress, the idea and purpose of attempting to render some additional assistance to agriculture or the farming interests of this country, believing by so doing that not only would the farmer be accorded a proper consideration by the Government but in the long run the entire business structure of our country would be benefited. No chain is stronger than its weakest link, and so the fabric and fiber of a good sound business throughout our country is weakened and nullified unless all legitimate business is given fair opportunity to fully reap its reward and profit, as a result of the exercise of good judgment and an appropriate amount of intelligence and energy.

A great deal has been said and written about "balancing the Budget," which presupposes an unbalanced one. The human mind runs generally to one point on this, due to a great mass of publicity given to the matter, which publicity, however, has very generally looked at the question almost solely from the question of dollars and cents rather than that of "dollars and sense." The real "budget" is that of human rights, and that in America has been so unbalanced, and so long unbalanced, that it has presented, and still presents, a real problem for solution, and fundamentally the purpose of the President and the majority of the Democratic Congress is to properly adjust and balance the budget of human rights as well as the Budget usually referred to.

Now, it undoubtedly is quite a big job to be President of the United States for many reasons, two of which readily occur to mind: First, the vast number and multiplicity of vexing and stupendous problems that the President and Congress have to handle and solve. Second, then there are so many "would-be Presidents" both in and out of Congress—and both in and out of business and both in and out of the requisite amount of "gray matter," that with the thousand and one panaceas it really does present a question after all. Then, too, Franklin Roosevelt is our President—and as such found the farmers of America floundering on their backs, ridden to death by debt and extremely low prices for the products of the farm. Legislation passed by Congress and signed by him during his first term has done a vast amount of good for the agricultural interests. One thing is certain, without a successful and profitable employment in agricultural pursuits in America means eventually a very general collapse.

Major pieces of legislation such as the agricultural bill cannot, of course, be entirely agreed upon by all the varied interests, but it does supplement helpful legislation already passed, and will, if not finally amended too much, be very helpful in assisting in the maintenance of a more equalized price of farm commodities and a more equable supply on the market, and this will be reflected in the livestock values and prices, and they will be impressed also with a more uniform price and market value, which will be in the long run better for both the producer and ultimate consumer.

Inauguration of the American Bellicourt Monument, Bellicourt (Aisne), and the Brookwood American Cemetery, Brookwood, Surrey, England

EXTENSION OF REMARKS

OF

HON. CHARLES A. EATON

OF NEW JERSEY

IN THE HOUSE OF REPRESENTATIVES

Tuesday, December 7, 1937

ADDRESSES BY THE HONORABLE BRIG. GEN. J. B. P. CLAYTON HILL, D. S. M., FORMER REPRESENTATIVE FROM MARYLAND

Mr. EATON. Mr. Speaker, under the leave to extend my remarks in the RECORD, I include the following:

INAUGURATION OF THE AMERICAN BELLICOURT MONUMENT, BELLICOURT (AISNE), AUGUST 9, 1937

(Introductory address by the Honorable Brig. Gen. J. B. P. Clayton Hill, D. S. M., former Representative from Maryland in the Congress of the United States of America, member of the American Battle Monuments Commission.)

Just north of St. Quentin, in the region of the Somme, the American Twenty-seventh and Thirtieth Divisions, forming our Second Corps, went into the front line with the British Army to attack the formidable Hindenberg line. On this part of the front the Hindenberg line followed roughly along the St. Quentin Canal and made use of that obstacle as a primary feature of its defense system. For more than 3 miles the canal flows through a historic tunnel which the enemy converted into a huge underground shelter and storehouse. They dug comfortable bomb-proof rooms into the tunnel walls, and by means of numerous passageways maintained communication with their machine-gun nests and trenches above ground. Canal boats, tied up in the tunnel, afforded other living quarters and a fully protected magazine for supplies. It was one of their strongest places of defense, but on September 29, 1918, when the offensive was launched, the famous Hindenberg line cracked under the blow. Both American and British losses were severe. Other American units, the Thirty-third and Eightieth Divisions and the Sixth and Eleventh Engineers, also fought with the British in this part of France. The monument we dedicate today commemorates these several activities. It stands atop the ridge over the tunnel of the canal.

At this moment we are directly over the old subterranean water route, which was begun in 1769 and after several interruptions was completed in 1810, at the order of Napoleon.

The dedicatory address of this tribute of the United States of America to the troops that fought here will be made by the Honorable J. WALTER LAMBETH, a Representative of North Carolina in the Congress of the United States of America.

While at Harvard University in 1917, Representative LAMBETH enlisted as a private soldier, came to France in July 1918, and served through the rest of the war in the First Army Artillery at St. Mihiel and Meuse-Argonne. He rose to the rank of sergeant before the armistice.

The monument at Bellicourt memorializes the service of the Twenty-seventh and Thirtieth Divisions. The Thirtieth Division consisted of the National Guard of North Carolina, South Carolina, and Tennessee, called the "Old Hickory" Division in honor of Andrew Jackson. The Twenty-seventh Division was composed of the National Guard of New York.

While Mr. LAMBETH was not a member of the Thirtieth Division and did not serve in this sector, a company from his little town was a part of the One Hundred and Nineteenth Regiment, which captured Bellicourt from the Germans and suffered heavy casualties, among whom was a first cousin of Mr. LAMBETH.

Representative LAMBETH is a member of the Foreign Affairs Committee of the House of Representatives, appointed by Speaker

BANKHEAD as one of the three delegates to represent the House with Messrs. LISTER HILL, chairman of the Committee on Military Affairs, and Mr. EATON, a member of the Committee on Foreign Affairs of the House.

INAUGURATION OF THE BROOKWOOD AMERICAN CEMETERY, BROOKWOOD, SURREY, ENGLAND, AUGUST 15, 1937

(Address of the Honorable Brig. Gen. J. B. P. Clayton Hill, D. S. M., former Representative of Maryland in the Congress of the United States of America, member of the American Battle Monuments Commission)

On the 16th of June 1918 I stood on the bridge of the transport *Pastores* with my division commander, General Morton, while our transports fired at the periscopes of two enemy submarines and our destroyers dropped depth bombs. We had sailed the night before from Camp Steuart, Newport News, Va., and this small naval battle occurred off the Capes of Virginia. The Navy was credited with the destruction of one submarine.

On the 14th of December 1918 I stood on the troop-lined bridge de la Concorde in Paris and saluted President Wilson as he crossed for the peace conference. In one of the carriages behind President Wilson was Mr. Henry White, one of the peace delegates on behalf of the United States, former Ambassador to France for many years, Secretary of the American Legation in London, and one of the delegates to the Algeciras Conference in 1911, after the *Panther* went to Agadir. The war was over, and the eyes of the whole world searched eagerly for a peace that would be permanent.

England had not wanted war; France had not wanted war; Belgium had not wanted war; the United States had not wanted war. But war was forced upon them just as war was forced upon the inhabitants of New England by the Indians in the days of colonization.

His Majesty George V, in greeting General Pershing on his arrival in England on Saturday, June 9, 1917, at Buckingham Palace, said: "It has always been my dream that the two English-speaking nations should some day be united in a great cause, and today my dream is realized. Today we are fighting for the greatest cause for which peoples could fight. The Anglo-Saxon race must save civilization."

General Pershing had said on his arrival in England, Friday, June 8:

"Speaking for myself personally, the officers of my staff, and the members of my command, we are very glad indeed to be the standard bearers of our country in this great war for civilization. To land on British soil and to receive the welcome accorded us seems very significant and is deeply appreciated. We expect in course of time to be playing our part, and we hope it will be a very large part, on the western front."

Last Sunday the American Battle Monuments Commission, Ambassador Gibson presiding at the ceremony, in the presence of the official delegates of the United States of America, the Prime Minister, the Secretary of War, and other high Belgian officials, dedicated the American cemetery at Waereghem. Later in the day the American monument at Kemmel, near Ypres, in Belgium, was dedicated. Last Monday, August 9, we dedicated the American memorial at Bellicourt. As I presided at these last two ceremonies I recalled the words of His Majesty George V, and of General Pershing, and the words of President Wilson that the English-speaking people had been fighting side by side to make the world safe for Anglo-Saxon democracy.

When on April 16, 1918, General Pershing discussed with General Foch the organization of an American army, General Foch remarked that the enemy was very aggressive, and referred to his severe attack against the British on the Lys between Lens and Ypres, which began on April 9 and was still in progress on the 16th. General Pershing had written, "The German offensive on the Lys was another formidable attempt to break the British lines. The attack was made to the north and south of Armentières on a front of 24 miles by 27 German divisions."

It was during this April German offensive that Marshal Haig issued his order of April 11: "Three weeks ago today the enemy began his terrific attacks against us on a 50-mile front. His objects are to separate us from the French and to take the channel ports and destroy the British Army." Marshal Haig concluded the order with the following words: "There is no other course open to us but to fight it out. Every position must be held to the last man; there must be no retirement. With our backs to the wall, and believing in the justice of our cause, each one of us must fight on to the end. The safety of our homes and the freedom of mankind alike depend upon the conduct of each one of us at this critical moment."

When General Pershing decorated the chief of staff of the Fourth British Army, Maj. Gen. Archibald A. Montgomery, with our Distinguished Service Medal, General Pershing's citation of the now field marshal, Sir A. A. Montgomery-Massingberd, expresses what the Americans did, side by side with the British. General Pershing's citation was, "As chief of staff of the Fourth British Army he directed the operations of the Second American Army Corps with distinguished ability, displaying military attainments of the highest order. The officers and soldiers of the Twenty-seventh, Thirtieth, and Thirty-third United States Divisions are justly proud of having served with their English comrades against the common foe and of having shared with them in the successes which were due in no small degree to his capable direction."

Last Monday the American Battle Monuments Commission and the official delegates from the United States, headed by His Excellency Josephus Daniels, Ambassador to Mexico, Secretary of the Navy during the World War; Brig. Gen. Benedict Crowell, Assistant Secretary of War during the World War; Senator Duffy; Senator Russell; Senator Gibson; Representative Lister Hill; Representative Lambeth; and Representative Eaton visited the British cemetery at Bellicourt. I thought then of Brookwood, here in the sunshine of Surrey, our memorial in England to the cooperation of the English-speaking people for the preservation of civilization, and as I looked at the rows of graves of British soldiers in Bellicourt I prayed Almighty God that there would never again be war.

Last Sunday the Belgian Prime Minister, Mr. Van Zeeland, at the dedication of the chapel in the American Cemetery in Waereghem, said: "With heavy heart we have just trodden on thrice sacred ground, a bit of Belgian soil become, through sacrifice, a glorious extension of America."

This Brookwood, where we stand today, I like to think of as "a glorious extension of America."

These soldiers and sailors whose graves are here, died, using the words of the Belgian Prime Minister, "thinking that they were preserving from the same atrocious fate the youth of the generations to come. They fell, believing that their blood was given for peace on earth. They renounced all, that those who survived them might renounce the madness of hatred and of war."

Maryland was settled by the Calverts, from whom your Foreign Secretary, Mr. Eden, is descended. The Calverts originally came from Belgium to Yorkshire, and married Anglo-Saxons of Norman descent. I like to think of this Brookwood not only as a glorious extension of America, but as an extension of Belgium, France, and America in England for the peace of the world.

Maintaining Peace

EXTENSION OF REMARKS

OF

HON. JOHN L. McCLELLAN

OF ARKANSAS

IN THE HOUSE OF REPRESENTATIVES

Monday, December 6, 1937

Mr. McCLELLAN. Mr. Speaker, under leave to extend my remarks in the RECORD, I asked permission to include therein the following letter which I received from one of my constituents, a mother who is deeply concerned regarding America's remaining free from entanglements that would involve us in a foreign war, together with my reply thereto:

IVAN, ARK., *November 29, 1937.*

JOHN L. McCLELLAN,
United States Congressman, Washington, D. C.

DEAR CONGRESSMAN: I am just a little country mother of Dallas County, Ark., and in my simple way I want to beg of you to please support no measures that would involve our country in any foreign war. We want our country to stay at home and not get hooked in with any foreign countries that would demand American mothers to give their fairest and best. We ask that our sons might not be slaughtered on foreign battlefields. We haven't forgotten the World War, nor can we ever forget with all those graves across the sea and all those poor wrecked boys that marched away so healthy in mind and body and came back to live a life of misery the rest of their days.

And that's not all; we mothers feel that so many things have crept into our fair land from that war. Morals were lowered and things got started from the effect of it that have wrecked the very foundations of America. American womanhood has been lowered, homes are wrecked from the very things that crept here from that war; and we beg you as one of our dearest leaders to do all that is in your power to keep America tending to her own affairs.

There is plenty to do here—confidences to build up. Let us all cooperate together; "united we stand, divided we fall." Let us fortify our own shores, then if the war lords bring war to our shores we are willing to stand by the side of our sons and husbands and fathers and die for true democracy. We love our American Republic and all that it stands for, and our humble prayer is for the Stars and Stripes to wave forever. But to send our sons to be slaughtered on foreign battlefields, we say no—a thousand times no.

We do not wish to give one thing to satisfy foreign war lords, and American mothers are tired of giving their sons for their benefit.

So, dear Mr. McCLELLAN, our prayer is for you. May God bless you and guide you in making your decisions. The eyes of American mothers are upon you, and may you remember us little country mothers that love our sons so dearly and would die for them any day. We want them to greet them when twilight shadows fall and they return from their daily toil. We love to have the lamplight shining at the window for them. Could anyone think we would want to give them up to be slain for those foreign monarchs? No! Oh, no! It is too much to ask. So we do pray that God, our king, will hear our petition and guide and bless our leaders. We

beg to say that we do not admire all of our President's policies, and we don't want him to have too much power.

Tonight in my little cottage home I am praying God to bless you and America and the nations of the world.

Respectfully, from a little old-fashioned mother down in Dixie, near your home town.

MRS. PERCY GARRETT.

CONGRESS OF THE UNITED STATES,
HOUSE OF REPRESENTATIVES,
Washington, D. C., December 7, 1937.

MRS. PERCY GARRETT,
Ivan, Ark.

DEAR MRS. GARRETT: Your letter of November 29, expressing the hope our Nation will remain at peace and counseling against the enactment of any law that might lead to entanglements and involve us in a foreign war is most persuasive. You have, in very simple language, impressively conveyed the sentiments entertained by millions of American mothers—and fathers—who are apprehensive lest their sons be taken from their firesides and peaceful vocations and marched away to battlefields in strange lands and their lives sacrificed for a cause possibly the righteousness of which can neither be justified nor defended.

I hold it to be the highest obligation and duty of the President of the United States, his Cabinet, and Members of the Congress to exercise the authority and power entrusted to them by virtue of their offices, to promote peace and preserve the democracy that insures to us the liberty, freedom, and happiness enjoyed under our system of government. And I am happy to say that, in my judgment and without exception, the President and every Member of his Cabinet and of the Senate and House of Representatives are sincerely motivated by a desire to attain these objectives.

We do not want a recurrence of the horrible experiences of 1917 and '18. We cannot police the world. Our wisdom must be applied to and our strength and resources reserved for the preservation and defense of our own country and not squandered in attempted settlement of quarrels among other peoples and between other countries. In this we hope our example will be observed and followed by other nations. If, however, they choose war in spite of its horrible consequences, we can only regret and pity them in their destructive folly.

Thus, we should be adequately prepared to defend our own borders and repel invasion from land, air, or sea. If this becomes necessary, we have millions of sons who are willing to die, if need be, to resist the attack in any attempted invasion by a foreign foe, but we have no soldiers to be sacrificed on foreign fields for the aggrandizement of war lords and their dictators.

I am glad you took time to write and give me the benefit of your views on this subject, and it is comforting to know I am remembered in your prayers while I humbly try to serve my people in Congress.

Sincerely yours,

JOHN L. MCCLELLAN, M. C.

Mr. Speaker, this dear mother has appealed to her Representative in Congress to protect and safeguard the young manhood of this Nation from being unnecessarily sacrificed on foreign battlefields in a quarrel not our own but between other peoples and other nations. The sentiments she has expressed are those entertained in the hearts and expressed in the prayers of millions of American mothers and fathers. I believe, without exception, that the opinion and purpose of every Member of the House of Representatives are in accord with her views and that we can give assurance that insofar as it is humanly and honorably possible to do so, we shall, with the aid of Almighty God, keep this Nation free from foreign entanglements and endeavor by precept and example to show other nations the way to permanent peace.

The Farm Bill

EXTENSION OF REMARKS
OF
HON. GEORGE H. MAHON
OF TEXAS
IN THE HOUSE OF REPRESENTATIVES

Monday, November 29 (legislative day of Thursday, November 25), 1937

Mr. MAHON of Texas. Mr. Speaker, in my previous discussions on the floor I have discussed several provisions of H. R. 8505, the House farm bill, which I considered very harmful to west Texas cotton producers. In some of those discussions I referred to certain correspondence which I have received, and which, upon unanimous consent, I now insert in the CONGRESSIONAL RECORD.

The correspondence referred to follows:

UNITED STATES DEPARTMENT OF AGRICULTURE,
AGRICULTURAL ADJUSTMENT ADMINISTRATION,
Morton, Tex., November 26, 1937.

Hon. GEORGE MAHON,
Member of Congress, Washington, D. C.

DEAR MR. MAHON: We feel that the Congressmen in Washington are interested in agriculture and an agricultural program, and are doing their best to perfect a program as near suitable as possible to every section of the Nation, and we are sending you the following information pertaining to Cochran County so that you may be acquainted with the peculiar situation we occupy relative to the production of cotton.

Year	Acres planted in cotton	Number farms in county	Farm population	Farm cultivated acres
1911			50	
1921		3	160	300
1928	4,000	220	1,100	20,000
1929	5,321	245	1,300	32,916
1930	6,200	285	1,500	40,000
1931	7,500	335	2,000	55,000
1932	9,000	360	2,150	60,000
1933	9,000	325	2,100	65,000
1934	18,000	600	3,300	95,000
1935	20,000	625	3,500	100,000
1936	35,000	625	3,600	120,000
1937	70,000	660	4,000	160,000

Acreage in county, 500,000; cultivated acres in 1937, 160,000; tillable acres, 425,000; tillable land in county suitable for growing crops and cotton, 265,000 acres.

Hundreds of farmers are coming to this county and other west Texas counties to buy homes and coming largely from the Cotton Belt; they anticipate growing cotton as their cash crop. They do not require a large cotton base or acreage but will need a fair acreage to be given a chance to live and pay for the land; and we hope that a method may be worked out by you, or the Department, to allow an equitable cotton acreage for these counties and that a first-year base eligible for soil-conservation payments on sod land will be allowed.

Your consideration of this information and your help is needed and will be appreciated.

Yours truly,

ROY HICKMAN, JR.,
County Agent.
W. E. ANGLEY,
Chairman of the Agricultural Conservation Committee.

WASHINGTON, D. C., *November 26, 1937.*

Judge R. C. HOPPING,
Lubbock, Tex.:

New farm bill to be considered by House beginning Monday provides uniform percentage acreage allotment on each cotton farm in county which has been in cotton cultivation for 5 years, but if a cotton farm has been in cultivation only 1, 2, 3, or 4 years such farm would receive allotment equivalent only to one-fifth, two-fifths, three-fifths, or four-fifths, respectively, of the acreage allotment it would otherwise receive had it been in cotton cultivation for full 5 years. This provision as to cotton farms recently put in cultivation would be disastrous to many of our people. Please confer with County Agent Jobson and other informed persons and give me immediately by air mail an analysis of the injury that would be done in South Plains by this provision. Of the new cotton farms in this area, approximately how many operated by speculative interests on big-scale basis? Compare this number to new cotton farm operated on normal basis. Many thanks.

GEORGE MAHON.

LUBBOCK, TEX., *November 27, 1937.*

Hon. GEORGE MAHON,
House of Representatives, Washington, D. C.

DEAR SIR: Replying to your telegram of the 26th to R. C. Hopping.

It is the opinion of representatives from several counties, whose names are signed below, that the new cotton program will seriously affect:

33⅓ percent of the land in cultivation, and 40 percent of the total farms in Hockley County.

25 percent of the land in cultivation, and 10 percent of the total farms in Lubbock County.

75 percent of the land in cultivation, and 60 percent of the total farms in Cochran County.

25 percent of the land in cultivation, and 10 percent of the total farms in Lynn County.

25 percent of the land in cultivation, and 15 percent of the total farms in Dawson County.

55 percent of the land in cultivation, and 50 percent of the total farms in Bailey County.

25 percent of the land in cultivation, and 5 percent of the total farms in Crosby County.

The number of farms operated on a speculative basis is extremely insignificant but their acreage is large compared to the normal farm.

It is the consensus of all those present that it would be very desirable to set aside an estimated percent of not less than 1 percent of the total base acreage devoted to cotton in the United States in a pool to be drawn against by those sections or areas that are having a great increase in farm population through new settlement of farms. This acreage should be allocated from Washington on the basis of land utilization and trend toward cotton production. All States had such a study in progress several years ago and Texas has their publication in print with a man from the Division of Farm Management at Washington as senior author.

Trusting this information will aid you in securing a fair program for west Texas, we remain,

Very respectfully yours,

R. C. HOPPING.
W. E. ANGLEY,
County Committeeman, Cochran County.
C. C. JOBSON,
County Agent, Lubbock County.
G. A. GRAHAM,
County Judge, Cochran County.
D. L. JONES,
Superintendent of State Experiment Station, Lubbock, Tex.
H. D. POOL,
Assistant County Agent, Hockley County.
ED L. MCCRUMMEN,
County Committeeman, Lubbock County.
ED HOFACKET,
Former County Committeeman, Hockley County.

For Texas—Yes, but How About Greater Texas?

EXTENSION OF REMARKS
OF
HON. JOHN R. MURDOCK
OF ARIZONA
IN THE HOUSE OF REPRESENTATIVES

Tuesday, December 7, 1937

Mr. MURDOCK of Arizona. Mr. Speaker, several times during the progress of this debate I have heard the distinguished gentleman from Texas, chairman of the Agricultural Committee, say something like this, "Personally, I do not approve of the amendment, but if it were adopted, it would benefit my State more than the gentleman's own district." From this I got the idea that the chairman of the committee, and very rightfully so, was thinking of the effects of this pending legislation upon the country, as a whole, instead of its effects merely upon the great State of Texas. I commend this attitude and would not have it otherwise. On the other hand, I would not have the chairman of the committee disregard—I am sure he has not disregarded—its effects upon the great State of Texas.

It may be presumptuous in me to say this, but I believe I am within due bounds in calling the attention of the chairman of the Agriculture Committee and the floor leader of the House to the fact that this legislation, as thus far agreed upon, will work an injury, if not to the great State of Texas, at least to the greater Texas. I use the term "greater Texas" in its historical sense.

These gentlemen from the Lone Star State must remember, as every Texan does, that a hundred years ago Texas aspired to be much larger than it is today and, indeed, was very much larger in area. The founders of the Lone Star Republic aspired to stretch their borders to the Pacific. Had Texas done so, she would not only have included what is now the Panhandle of Texas but would have included the present States of New Mexico, Arizona, and Southern California. Although Texas did not retain possession of the eastern half of New Mexico, nor gain the area of Arizona, in another sense Texas has expanded toward the west almost to the sunset ocean.

In certain aspects present-day Arizona may be called an offspring of the State of Texas or, historically considered, she may be regarded as a part of greater Texas. Foremost in importance we may say that of the present population of Arizona more people have come into that State from Texas than have come from any other State in the Union. They are good citizens, too. Texas has also furnished Arizona two Governors; at least the present Governor of Arizona is a native of Texas. In industry Texas furnished Arizona the Longhorns, which were the first cattle on its ranges. Trail driving extended west out of Texas as well as toward the north. It is an outstanding historical fact that Texas was the most important point of origin of the vast cattle industry that filled the Great Plains and the Rocky Mountain area with long-horn cattle and all of the elements of bovine civilization which made the great West a generation ago.

At the present moment many of the men who are raising cotton in Arizona have come into our State from the State of Texas. Some have come there to make a new start in a new land under conditions quite different from those which they had in their original home in Texas. These are the cotton farmers, along with other newcomers, who are going to be hit hardest by the drastic reductive provisions of this bill.

As I see it, the present cotton section of this farm legislation aims to localize the production of cotton in the old cotton empire and prevent the cultivation of short-fiber cotton in any of the States which fringe the old cotton empire. If such is the intent and if such will be the effect of the bill, this measure sponsored largely by these legislative leaders from Texas, will work a hardship and heavy loss upon the former children of the Lone Star State.

Please do not misunderstand. Arizona is no suppliant! She asks nothing of anybody but simple justice. Arizona's people have come from almost every State of the Union. Her people have worked out a marvelous development throughout her colorful history. I merely wished to show in this partial picture that, if Texas is a part of the United States of America, so also is Arizona. May our legislative leaders in this instance not forget this historic fact.

Gold and Silver Legislation

EXTENSION OF REMARKS
OF
HON. KEY PITTMAN
OF NEVADA
IN THE SENATE OF THE UNITED STATES

Wednesday, December 8 (legislative day of Tuesday, November 16), 1937

LETTER FROM HON. KEY PITTMAN, OF NEVADA, TO EDWARD A. O'NEAL, PRESIDENT OF THE AMERICAN FARM BUREAU FEDERATION

Mr. PITTMAN. Mr. President, I ask unanimous consent to have published in the Appendix of the RECORD a letter that I have written to Mr. Edward A. O'Neal, president of the American Farm Bureau Federation, in reply to certain inquiries made by him relative to gold and silver legislation, and the administration of such laws.

There being no objection, the letter was ordered to be printed in the Appendix, as follows:

UNITED STATES SENATE,
COMMITTEE ON FOREIGN RELATIONS,
Washington, D. C., December 8, 1937.

Mr. EDWARD A. O'NEAL,
President, American Farm Bureau Federation,
1116 Garland Building, Chicago, Ill.

MY DEAR MR. O'NEAL: I take pleasure in answering your inquiry relative to a synopsis of the speeches I have delivered recently on silver legislation and administration. The subject is divided into two parts, namely, legislation relative to the coinage of American silver, and legislation under the provisions of the Agricultural Adjustment Act of May 12, 1933, and the purchase of silver generally, including foreign silver, under the Silver Purchase Act of 1934.

The speeches delivered by me on the floor of the Senate on November 22 and December 6, 1937, dealt exclusively with the

law and the administration of the act in the coinage of American-produced silver. The speech that I delivered before the Mining Congress at Salt Lake City on the 7th day of September 1937 dealt with both laws and their administration.

The Coinage Act was originally enacted for the purpose of restoring the use of silver in our monetary system, and to give sufficient value to it to permit the mining of silver and metals generally associated with it in ore or rock, namely, gold, lead, zinc, and copper. These reasons, together with the so-called London Agreement, induced the President to issue his first proclamation providing for the coinage of American-produced silver on December 21, 1933. At first he took 50 percent of such American-produced silver as seigniorage, or as a compensation for coining the other half of the silver for the benefit of the producers. As the Government circulates silver in the form of dollars at a valuation of $1.29 an ounce (because there is approximately three-fourths of an ounce in a silver dollar), the producers' half of the silver was then valued at 64.64 cents an ounce.

Subsequently the President, by proclamation, reduced the seigniorage charge by the Government to 40 percent of the silver, which left the producers 60 percent. Sixty percent of $1.29 gave a value to the producers of the silver of 77.57 cents an ounce.

It will be noted that there is no question of purchase in this transaction. The Government simply takes a part of the silver as seigniorage for such services. This act was chiefly responsible for the opening up of many mines in 1934 and in subsequent years and the taking off the relief rolls and placing in gainful occupation of 400,000 miners, mill and smelter men, and those directly dependent upon the industry.

The miners have received $12,788,570 annually for 3½ years through such minting of their silver in excess of what would have been received had their silver been sold in the open markets of the world in competition with foreign silver. Even if this were considered as a subsidy or a bonus, it would only mean $30 apiece annually to the 400,000 mine, mill, and smelter men. This has been the cheapest and most satisfactory relief work ever conducted. The Government's part of this silver was 75,917,000 ounces, which, at a value of $1.29 an ounce, at which value it circulates as currency, the Government has made a profit of $83,160,860.

The last proclamation by the President authorizing the minting of American-produced silver expires on the 31st day of December 1937. I, together with other representatives and citizens of the mining States of the West, seek to have the President issue another proclamation extending such program until at least the 30th day of June 1939.

We are creditably advised that if this is not done the price of silver will immediately fall to 44¾ cents an ounce, and possibly to 25 cents an ounce, the price of silver in 1931 and 1932. We are also creditably advised that if this takes place, owing to the depreciated price of copper, lead, and zinc, with which silver is generally associated, that most of such mines in the United States will close down, with the same results that occurred in 1931 and 1932; that is, hundreds of thousands of men will be thrown out of employment and placed on relief rolls.

This is a matter of vast importance to agriculturists. In most of the Western States mining and stock raising are the chief industries. In Utah, for instance, it has been determined that 47 percent of the people depend upon mining for their livelihood. The percentage is even greater in the State of Nevada. If the mines close down, the farmer's local market is destroyed and he must seek markets in other States, which, under depressed conditions, are already oversupplied.

The taxes that are paid by operating mines on the metals that they produce must, from that time on, be borne by the land and the products of the farm.

There is an effort being made by those who do not know the mining industry to urge the President to continue the minting of American-produced silver, but to take a larger percentage of the silver as seigniorage. All mining men agree that to reduce the price of silver would result in the closing of mines. No chance should be taken with such an effect.

The Silver Purchase Act has resulted in the purchase by our Government until June 30, 1937, of 1,015,828,000 ounces of silver at a price of $589,773,000. The Government has issued silver certificates to the amount of $589,773,000, being the purchase price of such silver. In other words, it has paid for such silver with the silver certificates which it has placed in circulation. It has cost the Government no taxes, nor has it caused the Government to borrow any money. The Government, in addition thereto, has earned a profit on such silver of $720,645,120, because it may issue silver certificates against the balance of such silver over and above the purchase price to the value of $1.29 an ounce.

It is charged that this has been a dangerous inflation of our currency. It would seem to be the duty of our Government to expend its currency when credit is deflated and contracted. Ninety percent of our circulating media consists of checks and drafts. Only 10 percent consists of currency. The last report that I have from the Treasury Department shows that there was in circulation $6,555,101,269 of currency. The Treasury Department treats everything that is not in the Treasury as in circulation. As a matter of fact, the report of the Federal Reserve Board discloses that the banks are carrying 80-percent reserves as against deposits. Therefore, a large portion of the so-called currency in circulation is in reality not in circulation but is frozen in banks as currency reserves; that there has been an enormous deflation and contraction in credits is conclusively proven by the tremendous reserves that banks are carrying.

Through the Silver Purchase Act there has been added to the currency of the country $589,773,000, with the power of the Government to add to such currency circulation, through silver certificates, an additional $720,645,120.

Let it be remembered that today there are 1.72 ounces of silver in the possession of the Treasury of the United States for every silver certificate that has been issued under the Silver Purchase Act. There is more intrinsic security behind these silver certificates than behind any currency of the United States, because such silver certificates are redeemable in silver dollars, while other forms of currency are not redeemable in anything.

I consider these acts of as much importance to the agriculturists of this country and to labor as they are to the miners.

This is simply a synopsis of the arguments I have made in the three speeches referred to. You will find facts and figures in these speeches.

With best wishes, I am,

Sincerely,

KEY PITTMAN.

Disabled American Veterans of the World War

EXTENSION OF REMARKS

OF

HON. EDWIN C. JOHNSON

OF COLORADO

IN THE SENATE OF THE UNITED STATES

Wednesday, December 8 (legislative day of Tuesday, November 16), 1937

ADDRESS BY MAPLE T. HARL, NATIONAL COMMANDER, DISABLED AMERICAN VETERANS OF THE WORLD WAR, NOVEMBER 8, 1937

Mr. JOHNSON of Colorado. Mr. President, I ask unanimous consent to have printed in the RECORD a radio address delivered on November 8 by Mr. Maple T. Harl, national commander of the Disabled American Veterans of the World War.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

Ladies and gentlemen, first I want to express the appreciation and gratitude of the Disabled American Veterans of the World War to the National Broadcasting Co. and to this station for having so graciously extended their facilities for this brief broadcast. I desire also to extend my greetings to those disabled in the World War, particularly those still hospitalized throughout the country.

When the armistice came November 11, 1918, America was no more prepared for peace than she was prepared for war when we entered the conflict April 6, 1917. The result was that when thousands of our wounded returned from overseas there was no adequate provision for their care. Indeed, it is literally true that a continuous stream of those victims was forced to pass through a department-store building in lower New York that had been hurriedly converted into a hospital because there was no other place available. As the lack of preparation to take care of these men became known throughout the country, groups of the disabled organized and finally met in national convention at Detroit. That meeting marked the inception of the Disabled American Veterans of the World War. From this small beginning, the organization has steadily increased in numbers, prestige, influence, and appeal. Last year marked one of the largest single gains in membership in any year since the order was founded. After observing the D. A. V. for a number of years, Congress finally honored the organization by granting it a special congressional charter—an honor never before or since extended to any similar association in the history of the Republic.

D. A. V. FOR WAR DISABLED

In order to understand the principles of the Disabled American Veterans, it is necessary to differentiate sharply between the men whose disabilities resulted from the war and those who have become disabled since the armistice. While entirely sympathetic with the latter group, the Disabled American Veterans has limited itself to the care of the former, or those with disabilities of war origin. The first Detroit convention charted this channel and through it has run the whole course of the efforts and achievements of the Disabled American Veterans. Hence, our membership is necessarily limited to those with battle injuries, service-connected disabilities, and handicaps caused by the war.

From the outset we felt that the American people realized that the Government owes a lasting obligation to the men disabled in the war and to their dependents. Our program has consisted of three major objectives. First, we feel that a man who is a physical or mental victim of the war is entitled to the best possible medical care, whether his disability is temporary or permanent. Having

provided a cure—so far as cure is possible—we believe that the man should be reasonably compensated for his loss. Replacement of an arm or leg or an active brain or a healthy lung is obviously impossible. The very derivation of the word "compensation" shows that it means substitution for a loss, but not necessarily in kind, while the derivation of the word "pension" indicates a set gratuity for past services. We contend that compensation payments should be most liberal. However, should the Government give proper treatment and then pay partial compensation for partial losses, the Government is still most remiss in its obligation if it does not do its full part in a systematic placement of the qualified disabled in employment. My contacts with these men have covered a period of nearly 20 years, and I say without reservation that their desire is to resume their place in civilian pursuits, meaning proper employment. While it may be that here or there you may find an individual veteran who is willing to attempt to live on compensation, investigation will disclose that he is a trivial minority of the 335,000 who are today rated disabled as the result of war service. Statistics show that the average veteran's family consists of four persons, and it would be the height of folly to attempt to contend in this day of high prices that a man who has honorably served his country in time of need, with no other resources, can support four people on about $22.50 per month, which is the average compensation paid these veterans exclusive of the permanently and totally disabled and the hospitalized cases.

LOOK TO PRIVATE INDUSTRY

While we are continuously criticizing in a constructive manner the Government's administration of this problem, we realize that the Government is sincere in its endeavors to solve same. Therefore, we feel it is to the private employer and industry that these men must look for gainful employment. A disabled veteran is not necessarily unemployable, but, unfortunately, many who are employable are unemployed through a combination of circumstances over which they have no control.

To meet this condition the Disabled American Veterans was the first national organization of the World War to establish an employment department as one of its major activities. As a result we have succeeded in the placement of many of these men, but hundreds still remain jobless. I am, therefore, most earnestly appealing to employers of men in large or small numbers to give preference to those qualified whose disabilities came from the war. Of course, this does not mean that employers are asked to employ all disabled veterans, for, as stated, we are appealing only for those who are qualified to fill the jobs at hand.

Because of their very nature, the laws, regulations, and rules of the Veterans' Administration constitute to many a technical puzzle. Many veterans, because of wartime service, were denied in their youth the usual privileges of education. Many of them cannot understand our language, while many others are so busily engaged in occupations that they cannot follow changing laws and changing regulations. To meet this situation the Disabled American Veterans has placed in most of the important offices of the Veterans' Administration throughout the land well-qualified rehabilitation officers, who without charge act as free attorneys for the veterans and their dependents and also keep all informed on each development that may personally affect them. The Disabled American Veterans is, furthermore, the only national organization that publishes a semimonthly newspaper devoted exclusively to the cause of these men, containing information of vital importance to them.

COMMENDED BY PRESIDENTS

We take pardonable pride in the fact that successive Presidents, including Calvin Coolidge and Franklin D. Roosevelt, have commended our work and that our efforts have met with many testimonials of appreciation from the head of the Government agency ministering to the disabled. The Disabled American Veterans recognize no political, religious, or racial discriminations. The sole test is: Did you serve your country honorably in the World War and is your disability of war origin? We consider our membership roll a roll of honor, and contained on it are the names of those descended from practically every race throughout the world. Our leadership has rested with Republicans and Democrats, with Jews, Catholics, and Protestants, while in a number of places we have chapters composed exclusively of colored veterans.

The only departure we make from stressing legislation for the direct care of the wartime disabled is in the matter of combating subversive movements and advocating proper preparedness, together with a lasting program for peace. Recognizing the right of each individual to be his own sole guide on matters of politics and religion, we feel that such "isms" as communism, nazi-ism, and fascism have no place within our borders, as their purposes are destructive to American institutions, and we concede our loyalty to but two "isms", Americanism and patriotism. We are now doing our part to curb the activities of those agents of the other "isms" which are detrimental to our institutions.

ADEQUATE DEFENSE

We feel that adequate national defense no more brings on war than life insurance speeds death. With war and the talk of war terrorizing the whole world, America would be unfaithful to those who have lived and died for her if she permitted herself to become Chinafied by failing to defend her cherished rights.

With this brief outline of our history and our principles, I extend a hand of welcome to any man or woman who can meet the requirements for membership. If there is a chapter of the Disabled American Veterans functioning in your community, your place is in that chapter. But, because of the relatively few service-connected men in the smaller cities and towns, we have membership-at-large chapters; dues entitling membership include the regular delivery of our newspaper, which is recognized as the most outstanding of all veterans' publications. Should any veteran desire further information, it may be obtained by writing to national headquarters, Disabled American Veterans of the World War, Cincinnati, Ohio. Recommendation of our policies and objectives may be obtained from any Federal, State, or local official with whom we have had contact.

Because of the strict eligibility requirements for membership, it is obvious that the Disabled American Veterans cannot be the largest veterans' organization numerically. On the other hand, I submit that no existing association has a stronger claim on the public for support, and again suggest to veterans eligible to membership that they delay no longer in affiliating with an outfit that labors constantly to conserve their interests and one whose loyalty to God and country can never be questioned.

Thank you and good night.

A National Program for Wheat

EXTENSION OF REMARKS

OF

HON. WALTER M. PIERCE

OF OREGON

IN THE HOUSE OF REPRESENTATIVES

Wednesday, December 8, 1937

RADIO ADDRESS OF HON. HENRY A. WALLACE, SECRETARY OF AGRICULTURE, BEFORE A WHEAT MEETING AT WICHITA, KANS., NOVEMBER 23, 1937

Mr. PIERCE. Mr. Speaker, under the leave to extend my remarks in the RECORD, I include the following:

You and I have come here to Wichita to talk about wheat. This is the very heart of the Winter Wheat Belt, and one of the best places to talk about a national policy for wheat. Today we want to consider the elements of a sound long-time wheat policy.

Throughout the centuries wheat has meant bread and bread has meant life. Wheat production and wheat marketing stand out among the most dramatic phases of our national activity. Wheat is produced in 2,600 of the 3,000 counties in the United States. From the Atlantic to the Pacific, from the Canadian border to Texas, wheat fields ripple in the winds of early summer. While the crop is grown in widely scattered parts of the country, it is almost the all-in-all of large areas in the West. On the rolling uplands of the Columbia River Basin, on the broad prairies of the Dakotas and Montana, and on the sweeping plains of Kansas and the Southwest wheat fields are spread in vast expanse. These great producing areas of the West are the bread basket of the Nation.

The story of wheat extends to the wheat-milling centers, the Chicago wheat pit, the kitchens and dining rooms of our homes, and out over the world. It is a dramatic story all the way. In the United States the wheat industry is one of the main cogs in our economic machine. Go back and read the story of the Nation-wide depression of 1931 and 1932 and of the recovery that began in 1933. You will find plainly written there the story of the fall and rise of wheat prices and wheat income. The latest news about the production and price of wheat headlines the market pages. It is scanned carefully by businessmen, investors, and farmers. Today, when American businessmen are wondering about the future, they are asking themselves, What about wheat in the years just ahead? Wheat is a barometer of business.

It is so everywhere. Each month wheat is being harvested somewhere in the world. Wheat is the commodity most widely produced and consumed. One might say that wheat, more than any other commodity, binds the economic system of our world together.

Nevertheless the wheat industry has had many ups and downs. From the early days of the colonies to the settling of this vast western country, the fortunes of the wheat industry were mostly up. New and adapted varieties were brought in from far countries, railroads for transporting the wheat were built. Reapers, binders, and combines were introduced, one after the other, to make the American wheat grower the envy of the world. But for all the tremendous volume of wheat that we grew, there was a market—either in this country or overseas. We were in debt to Europe for much of the capital that had built the railroads and developed the mills and the mines. The wheat sold to Europe helped to pay that debt.

After the grain areas of Canada and Argentina had been opened up our exports fell from around 200,000,000 bushels in the 1890's to less than 100,000,000 bushels by 1910.

Then came the World War. Bread was the first need of all the armies. Our slogan was "Food will win the war." Wheat growing expanded beyond anything this country had yet seen. Section after section of prairie sod, that had been in grass since long before the days of Coronado, was broken for wheat.

But after the war things were different. We had changed from a debtor to a creditor Nation. Europe had acquired a war fear that drove her peoples to raise much of their own wheat. Our growers were left with an overexpanded plant, which could be used to the full only while American loans kept a prop under foreign buying. I well remember how in Kansas in the early summer of 1920, when wheat was $2.50 a bushel, a movement was started to hold for $3. And you perhaps remember even more vividly that the farm price by August 1923 had fallen to 86 cents.

For 10 years the problem of wheat bedeviled growers and men in public life. Producers first tried to solve it by cooperative marketing through farmers' elevators, terminal sales agencies, and wheat pools.

Many important benefits came from cooperative marketing, but farmers decided the problem was too big to be solved without Government help. They worked out the McNary-Haugen plan, which received its first big push from western wheat growers, and its first draft was designed to help wheat more than any other crop. This plan was to make the tariff effective on wheat by segregating exports from the domestically consumed portion of the crop. After the McNary-Haugen bill had twice met with Presidential veto wheat farmers had to be content with the Farm Board, set up under the Agricultural Marketing Act of 1929. You remember how the Farm Board's attempts to support prices of wheat failed as production and supplies mounted year by year, how the price of wheat in 1932 fell to the lowest level since the time of Queen Elizabeth. Wheat producers were almost completely out of the market for industrial goods. Thousands of wheat growers lost their farms. Some people said that we would have to forget about the world market for our wheat. They said that enough wheat producers would have to be starved out to shrink the industry back to a domestic basis.

This heartless doctrine was rejected by the overwhelming mass of farmers. They did not believe, and I do not believe, there is the slightest excuse in this day of social progress to subject any great group of our people to such barbarism. Yet the same heartless doctrine is being advocated today by some who would deny to farmers the same chance they accord to other groups to shield themselves against the worst effects of competition unrestrained. The Nation rejected that doctrine 5 years ago, and the Nation will reject it now.

Out of the suffering of the depression years the Agricultural Adjustment Act of 1933 was born. I do not need to recall to you the programs under that act affecting wheat—the county associations and committees of wheat producers, the processing tax on wheat, and the benefit payments made to those growers taking part in the acreage adjustment program. I do not need to recall how the wheat program in the United States was linked up with the world wheat agreement, signed by 9 producing and 17 consuming countries. These measures gave promise for the first time since the war of dealing with the chronic problem of the wheat surplus.

But about the time that they were adopted the wheat picture changed once more. During the 15 years ending in 1932 the production of wheat in the United States had fallen below 800,000,000 bushels only three times. It had gone above 900,000,000 bushels four times. But, beginning with 1933, there were 4 successive years of short crops. Drought and rust did their work. If the yields and abandonment on the planted acreage had been normal, these four crops would have averaged 889,000,000 bushels. Actually they averaged 582,000,000 bushels, or 300,000,000 bushels less each year than we might have expected from the acreage planted. For the first time since 1837 and for the second time since the signing of the Constitution, the United States became a net importer of wheat. World wheat supplies gradually grew smaller and world prices improved. With small supplies in this country Chicago prices rose above Liverpool. Devaluation of the dollar also played a part. As a result of all these things the price of No. 2 hard winter wheat at Chicago advanced from an average of 47 cents in November 1932 to $1.46 in April 1937.

With Nature, temporarily at least, doing away with the surplus, the situation of wheat producers was much different. Instead of having a lot of wheat to sell at a low price, farmers in the drought and rust areas had little or no wheat to sell and could not take advantage of the greatly improved price.

Also, with the advent of drought, wheat farmers in the Great Plains found they had a terrible new problem to contend with—dust storms. Suddenly there was crying need not only to stabilize the production of wheat and incomes of growers but to stabilize the soil itself. There was need to keep it from blowing away across the Mississippi River and on to the Atlantic Ocean. The mistake of overplowing the plains country had brought a disastrous result.

The short crops and scant supplies of wheat prevented wheat producers from feeling the full effects of the Hoosac Mills decision of the Supreme Court when it came in January 1936. And the Soil Conservation and Domestic Allotment Act, quickly passed by Congress to replace the broken parts of the old Triple A, helped wheat farmers to adopt farming methods that would hold their soil in place.

The season of 1937 was the first in 5 years with wheat weather even moderately favorable. Wheat yields per acre came up to somewhere near average. That yield on a record breaking acreage brought a big crop of wheat—nearly 900,000,000 bushels. The big crop started to market at high prices because of unusual situations outside of the United States. From January to April of this year the farm price of wheat was above $1.20 a bushel, or slightly above parity.

But no sooner had you reached this point than you began to find yourselves slipping down again. This year's big crop was 250,000,000 bushels more than we need for domestic consumption. That put American growers back on the export market. The Chicago December future, which had been quoted at $1.31 last July 16, was down to 84 cents on November 8.

Now, as you wheat growers look ahead, you are wondering what is going to happen to you. During the next few years which end of the seesaw of weather and price are you going to find yourselves on?

In 1932, judging by the experience of the preceding 100 years, no one would have dreamed that there would be four short wheat crops in a row, averaging less than 600,000,000 bushels. The four short crops in a row did happen and therefore some day might happen again. But since the present year has brought us back nearly to the 900,000,000-bushel level, we have strong reasen to think that perhaps the surplus-wheat problem of the twenties and early thirties will return in full force.

As I have said, the ups and downs of the wheat industry have been dramatic. But they have been painful for the growers of wheat. They have been painful, too, for the millers and handlers of wheat, for the businessmen and workers depending on wheat growers' purchasing power, and for the consumers buying wheat flour and bread.

This variable character of the wheat industry can be put down as No. 1 in listing the main aspects of the wheat problem.

There are others.

No. 2 is the fact that human stomachs don't change in size. When people have more money to spend most of them buy less wheat rather than more. They spend a bigger part of their money for livestock products, fruits, and vegetables. This is why economists say the demand for wheat is inelastic. For some years the per capita consumption of wheat has been slowly decreasing, as people's food habits have changed, though at the same time the increase in the population has partly offset the decline in per capita consumption. The point I am making is that we cannot assume that, no matter how much wheat is grown, it will all get eaten by the American people if the price is only low enough. Experience has shown that, instead, an excess supply simply piles up and demoralizes the price. That low price for wheat doesn't help either the producer or the middleman or the consumer of bread. Actually it harms them all.

Factor No. 3 in the wheat problem is that present export markets will not take all the surplus wheat our farmers can produce in years of ordinary weather.

Our export markets dwindled after 1929 as our foreign loans ceased. Only one thing could have saved our export trade, once we had stopped lending other countries the money to buy our wheat, and that was a change to a more liberal tariff policy. But instead of lower tariffs to encourage world trade, we were given higher tariffs that strangled world trade. The Smoot-Hawley Tariff Act of 1930 was the worst blow ever struck at the wheat farmers of the United States.

During the last 4 years, of course, weather has reduced our supply available for export. This year, with an exportable surplus on hand and with the Canadian and Argentine crops heavily damaged, we are again shipping wheat abroad. From the first of July up to November 6, we have exported about 22,000,000 bushels. At this rate exports for the year would total about 60,000,000 bushels. But it is possible that exports from this year's crop may total as much as 100,000,000 bushels.

Remember that wheat exports this year are based on shortage in Canada and Argentina and on increased world demand resulting from the race to prepare for war. These conditions are abnormal and cannot be expected to continue long. If the United States is to have a dependable foreign outlet for wheat, this outlet must be assured through a revival of international trade that flows both ways. A start in this direction has been made through the reciprocal trade agreement program. If that program can be expanded, a part of our former markets abroad may be regained.

No. 4 in the list of things we must think about is the need to avoid soil destruction. If growers fail to balance up the wheat acres with acres of cover crops, and fail to follow proper conservation practices, the soil will be permanently damaged.

No. 5 is the fact that considerable areas now planted to wheat are really submarginal, and should be retired from cultivation altogether. The Government has already acquired some of this submarginal wheat land, but much still is being used.

No. 6 is the fact that five different kinds of wheat are grown in different areas of the United States. These are hard red winter wheat, grown in Kansas, Nebraska, Texas, Oklahoma, and Colorado; hard red spring wheat and durum wheat grown in the Dakotas, Minnesota, and Montana; white wheat, grown chiefly in the Pacific Northwest; and soft red winter wheat, grown throughout the areas east of the hard-wheat belts. The regions producing these five kinds of wheat have some problems in common, but there are important differences between them which must be recognized in mapping out a national policy for wheat.

No. 7 on the list of things we must face is the great expansion in wheat acreage that has taken place. In 1937 the farmers seeded 81,000,000 acres, whereas with average yields only about 60,000,000 acres would be needed to fill our domestic requirements and present export outlets. The prospect now is that, including the wheat already in the ground, the acreage is to be seeded to wheat for harvest in 1938 will be as great as it was in 1937. With average yields this would mean a crop of close to a billion bushels, or 350,000,000 bushels more than enough to fill our domestic needs.

The agricultural conservation program of the last 2 years has included wheat among the list of 15 soil-depleting crops from which acreage might be diverted for payment. But no special base or goal has been included for wheat, and none is included in the 1938 program.

The current wheat acreage—the largest in the history of the country—seems to be a response to the favorable wheat price. Further recession in the price might be expected to cause the wheat acreage to shrink somewhat. But experience during the depression showed that even 30-cent wheat did not squeeze out very many of the marginal producers. Lacking other opportunities, they kept on producing wheat, and the wheat situation steadily got worse. There is no reason to believe that if those conditions were repeated in the future anything different would happen.

The important point is that wheat acreage is at a level that with ordinary weather will give us crops far above what we need for use at home and what we have been selling abroad.

That completes my brief summary of the wheat problem. We have seen how the problems of soil depletion and submarginal land farming are linked to wheat, how wheat production varies although the demand is uniform, and how our export markets have dwindled while acreage has grown. Now, what should be our aims in working out a future policy for wheat? I think everyone will agree that our main objectives ought to be, first, to conserve the soil; second, to maintain growers' income; and, third, to assure adequate supplies for consumers.

It is easy to agree on those fundamental aims. But there may be difference of opinion as to the path to be followed to reach them.

As with cotton, there are two schools of thought about wheat. They stand at opposite extremes. One school of thought would lay emphasis on price, regardless of how small production would have to be to get that price. People holding this view would say good-bye to exports and definitely aim to produce only enough wheat for the domestic market. Following such a course would involve severe acreage adjustment and perhaps high loans. Drastic marketing quotas universally applied in the main wheat-growing areas would be necessary year after year.

Another school of thought, at the opposite extreme, would encourage unlimited production of wheat, through an export bounty or through unconditional payments to producers.

On a purely theoretical basis a plausible case for either one of these extreme courses might be made. Going to an extreme nationalistic basis might, on paper, seem to yield as much gross income for wheat as could be realized in any other way. So far, the wheat growers have not shown any inclination to do this. Regardless of the theoretical advantages of reducing wheat production to domestic needs, the wheat growers this year by planting 80,000,000 acres to wheat have in actual fact put their industry on an export basis with a vengeance.

I recognize that hard red spring wheat usually is nearly all milled in this country. But if wheat went on a domestic basis, farmers in that region would be affected too. The two hard-wheat regions are closely related. Hard winter wheat is the kind that is usually exported, it is true. But the export of hard winter wheat affects the price of spring wheat as well. The producers of hard spring wheat cannot expand their production without increasing the pressure from all the western wheat regions for larger outlets abroad. Wheat is wheat, and the fortunes of the different groups of wheat farmers rise and fall together. No region can hope to share in the benefits of any wheat program without sharing its burdens, too.

The control that would be needed to cut acreage from 80,000,000 down to 55,000,000 acres or less would be far more rigid than anything wheat producers have ever thought about. Unless wheat growers should drastically change their whole point of view, I doubt if such control as that could be made to work.

The case for the subsidy of unlimited production is also superficially plausible. But with world trade conditions what they are, if American wheat were dumped on the world market, other countries would simply raise trade barriers to the point where we could not scale them. It is true that in 1933 the Triple A made an exception of Northwest Pacific wheat and used an export subsidy to take care of the very large part of that wheat that needed export markets. But if put into general use for all wheats, the export subsidy plan would prove in the end to be a severe handicap to our efforts to reopen this country's foreign markets for wheat. Supplies in this country would pile up, and prices would collapse. Under such circumstances prices might even go lower than they did in 1932.

I do not believe that the majority of wheat producers want to choose either one of these extremes. As they think things though I believe they will choose a middle course somewhat similar to the one I have already recommended for the Nation's other great export crop—cotton.

The middle-course program I have in mind for wheat would consist of six main parts:

First, planning for that share in the world wheat market which will bring wheat farmers their maximum prosperity.

Second, the setting of acreage goals in line with needs of the soil and of the market here and abroad.

Third, protection against drought through an ever-normal granary, with reserve supplies of wheat stored on the farm or in elevators.

Fourth, crop insurance.

Fifth, retirement of submarginal land.

Sixth, price-adjustment payments, to be financed from tariff-equalizing taxes.

Let me discuss each of these briefly.

As to the first point—keeping our share of the world trade in wheat—I would like to remind all farmers once more that if the producers of the great export crops, especially wheat and cotton, lose their remaining markets abroad, agriculture will have to prepare itself for a degree of control and adjustment far greater than farmers have thought about thus far.

As this country prepares to ask for its share of the world wheat trade, so it is willing to share with other countries the burden of any necessary adjustment of production. The United States alone cannot and should not bear the entire burden of readjusting world wheat production to world wheat demands. When the Triple A wheat program was first started all the other important wheat-producing and wheat-consuming countries agreed to work with us, through the world wheat agreement, to adjust world acreage and exports to the needs of the market.

The succession of disastrously short crops after 1932 made such action unnecessary for the time being. While the principal wheat nations have continued to talk over the wheat situation from time to time at meetings of the International Wheat Advisory Committee, the action phases of the agreement were not continued. Now we seem to be moving into a period when, with normal weather and yields, world wheat supplies may again become excessive. Should such conditions develop, other wheat-growing nations will, I believe, again recognize the need for concerted action to deal with the problem. Meanwhile, with our present acreage and normal weather, the United States will very definitely be a substantial exporter of wheat.

The second part of the program, acreage goals for wheat, could be carried out under the present Soil Conservation Act, but additional legislation is needed to make them fully effective.

The goals probably should be varied in the different wheat regions, according to the needs of the soil and of the market. Fairness would require that amounts paid to farmers would vary according to the extent of the sacrifice involved.

We should, if possible, continue the provisions included in the 1938 conservation program for assistance to farmers of the Great Plains in diverting wheat acres to uses which prevent the soil from blowing.

Any adjustments in wheat acreage beyond the needs of soil conservation should not be construed as an effort to control the world price of wheat. The United States production of wheat is only one-fourth of that of the world, and naturally we cannot hope to control the world price. But since the price of wheat in the United States is responsive not only to the world market but to conditions at home, it is important to guard against the piling up of supplies so great as to cause a price collapse. Hence the provision for wheat-acreage goals.

The third part of the program would be the creation of an ever-normal granary for at least the hard wheats. Such a granary would not be needed for the white wheat of the Northwest, of which there is practically always an exportable surplus, or for the soft red winter wheat, which is always available in plentiful quantities.

But a granary for the hard wheats of the Great Plains would be very useful. The hard red wheats are in demand by the mills of this and foreign countries for mixing with the soft red wheat. But the hard red wheats are raised in areas where the weather is most uncertain and the crop is subject to damage from drought and rust. For this reason the supplies and prices of these wheats fluctuate widely. In years of short crops our customers abroad have had to turn elsewhere.

From every point of view it would seem to be wise national policy, therefore, to plan on having an average carry-over of these wheats, perhaps twice as great as the 90,000,000-bushel carry-over of these wheats that we have averaged over the last 3 years.

One possible way of building up the ever-normal granary for wheat would be through commodity loans, as I have recommended for corn. But a serious drawback to reliance on this method of building up the granary would be the fact that any loan above the market price might interfere with the free flow of wheat into export. Furthermore, loans made on one or two kinds of wheat would naturally result in demands for loans on other wheat, and the total effect of wheat loans at high rates might easily be disastrous.

For wheat, as for cotton, we want to be able to offer stop-loss loans, which would not seriously interfere with exports but which would prevent utter demoralization of the market.

Probably a sounder and better way to build up the granary would be through the proposed plan for crop insurance, which I am suggesting as the fourth part of a wheat program. Such a plan is embodied in the Pope bill which passed the Senate last spring and is now pending before the House. Under this plan farmers taking out the insurance would pay their premiums and collect their indemnities in wheat or its cash equivalent. Whenever a farmer's yield fell below some specified percentage of his normal yield—say 75 percent—he would be paid an amount of wheat or its cash equivalent that would equal the difference between his actual yield and the 75 percent.

Since the wheat representing the total of premiums paid in would be stored, it would be kept off the market in years of good crops and would be made available in the form of indemnities in years when crops were short.

If enough farmers took part to make such a crop-insurance plan work satisfactorily, it would be enormously useful to the wheat

farmers themselves. But it would be of great value also to the millers of wheat and their employees and to the consuming public. It would keep a more uniform supply available for export. It would help to level off some of the peaks and valleys in wheat supplies and prices resulting from weather changes from year to year. Like the proposed ever-normal granary for corn, it would help to stabilize the Nation's business.

The fifth part of the wheat plan would be to continue and expand the present program of retiring submarginal land, especially in the Great Plains area. Lands that nature intended never to be plowed should be taken out of wheat and returned to grass. Families that have been engaged in a bitter struggle to earn a living from such land ought to be, and are being, assisted to find a better opportunity. This program is bound to move slowly, but it will yield big dividends in human values.

The sixth part of the program, the price-adjustment payments, would be needed to offset the effects of price declines which are already felt and help wheat farmers to share in the progressive rise of the American standard of living. Where would these funds come from? Over a period of years, neither wheat farmers nor cotton farmers could depend upon subsidies from the General Treasury—subsidies which might be cut off any time Congress failed to appropriate the money. Therefore it would seem that with both cotton and wheat, the sensible thing would be to let the commodities themselves bear the load in the form of tariff-equalizing taxes levied at the point of first processing. As under the old Triple A, these taxes would be levied only on that portion of the commodity consumed in the United States, while the portion of the crop going into export would be sold at the world price.

Any such tax would, of course, have to be surrounded with consumer safeguards. We would want to be sure that the sum of the market price for wheat plus the tax would not cause any greater portion of the consumer's dollar to be paid out for wheat than was the case before the war. As long as safeguards like this are in force, consumers would have nothing to fear from such a tariff-equalizing tax.

To a consumer, what difference does it make whether he buys his bread on the basis of wheat in the market place or on the basis of 80 cents a bushel plus 20 cents tax? And right here I would like to call attention to the fact that, with wheat at $1 a bushel, the cost of the amount of wheat needed for a pound loaf of bread is less than 2 cents. A 20-cent tax means only a third of a cent on the consumer's loaf of bread. And yet to the wheat grower, receiving a corresponding amount may make the difference between bankruptcy and at least a minimum chance to make a living. Which would the consumer choose—to pay a third of a cent more on a loaf of bread and a few cents more on shirts and sheets, or to run the risk of the loss of employment and property values that eventually might flow out again from unstable farm income and farm purchasing power?

As I have recommended for cotton, the price-adjustment payments might well be made on an allotted production goal and should be conditioned upon participation in the conservation program.

If payments were large enough, the incentive for cooperation in the program would be very strong. Marketing quotas for wheat probably would not be necessary unless through a series of years of good weather, supplies piled up to an unmanageable level. But in such an emergency the use of quotas might prove very useful.

This six-part plan for wheat, if carried into effect, would not take the wheat growers of the Nation to some golden Eldorado. Even with its help I believe their future is not too rosy. But at least it would help them make an orderly retreat to an acreage in line with the needs of available markets.

Lacking such a plan, the only thing I can see ahead for the wheat industry, in case we have a series of years of ordinary weather, is a disorderly retreat through the harsh application of "natural economic law." This would mean that thousands of farmers would have to be starved off from their farms. It would mean hundreds of farming communities would be ruined. It would mean another cycle of closed country banks, diminished farm buying, and loss of jobs for city workers. The Nation cannot afford to ask the wheat farmers, wheat consumers, and industries dependent on wheat to pay such a price.

Now, as I see it, the key to the plan I have outlined would be the tariff-equalizing tax to provide the needed revenue. President Roosevelt, in his message to Congress a week ago, emphasized the need for a balanced Budget, and insisted that any expenditures for the farm program over those provided in the regular Budget should be balanced by an equal amount of new tax income. In other words, the farm program should be self-financing so far as possible. I am confident that the farmers appreciate the necessity of keeping the Nation's money affairs well ordered.

But let no one think that such a tax can be enacted into law without a fight. The tax would be ultimately paid by consumers, but some of the big processors from whom it would be collected will do all they can to block it. Already they are organizing.

I have here a yellow circular and a pink handbill put out by the Millers' National Federation of Chicago. Both urge millers to arouse consumers against the tax. The circular says: "Processing taxes can be stopped cold if the various interests adversely affected will do their part. By this we mean arousing consumers to the fact that they will carry the burden of any processing taxes levied and then for consumers to protest to Washington. Petitions are of absolutely no value in carrying this sentiment to Washington and the time and energy they require should be spent usefully. Practically the only thing that will count are individual letters from consumers, and these letters in great numbers."

The Millers' Federation states that it is prepared to supply members with "dodgers" in any quantity, the only condition being that these "dodgers" be put to use immediately.

Now, what are the facts? A year ago consumers were paying farmers $1.06 for each bushel of wheat that was milled. Today the farm price of wheat averages about 80 cents. If a processing tax of, say, 20 cents a bushel were added, the combined cost of wheat and tax would be $1 a bushel, or 6 cents less than the farm price of a year ago. These facts are completely missing from both the handbill and the circular.

It is a splendid thing for flour millers like all other free and independent citizens to express their convictions. But as a matter of fact, the legitimate interests of flour millers are promoted by stability of price for both farmers and consumers. It is high time for the processors to join together with the farmers and the consumers in fighting for stability instead of following the short-sighted policy of fighting against the best interests of all three groups.

I hope the millers, along with all other businessmen, will come to see that a long-range farm plan that will keep agriculture on an even keel will help them to stay on an even keel, too.

The all-weather wheat program here proposed is designed above everything else to serve the interests of wheat producers and wheat consumers. To my mind, the ups and downs of wheat lie very close to current problems which are giving the whole Nation concern. How can the people hope to make a successful attack upon the business cycle unless they have a chance to iron out the extreme swings in prices of basic farm commodities?

As I said a few days ago at Indianapolis, if we can stabilize farm prices and farm income, we will go a long way toward giving the Nation the economic balance wheel that it so greatly needs.

From the standpoint of the vital interests of the consumer, the wheat program must not be considered by itself. It should be considered along with the ever-normal-granary plan to build up storage reserves of corn, and sound plans for the cotton growers, dairy and livestock producers, and other farmers. These plans are interdependent, and the success of any one would contribute to the success of the others. An essential purpose of these plans must be to iron out extreme fluctuations in farm price and in farm income. If that purpose can be accomplished, it will have benefits for the consumer which will far offset any disadvantages. It will launch an attack on the cycles of boom and collapse that again and again threaten our civilization. It will help make our American system work.

But there are those who want no attempt like this made. Every farmer knows that a few powerful financial interests are and always have been opposed to any real farm program. These interests are active now. They want to go back to the do-nothing farm policy of the twenties.

Opponents of the tariff-equalizing tax have already claimed that it is unconstitutional. But, as President Roosevelt pointed out last week in his message to Congress, "the courts themselves are coming to have increasing regard for the true nature of the Constitution as a broad charter of democratic government which can function under the conditions of today." Since the Triple A decision of the Supreme Court nearly 2 years ago, acts of Congress to improve labor relations and assure workers' security have been upheld.

"In these later decisions," the President said, "the powers of the Federal Government to regulate commerce between the States and to tax and to spend for the general welfare have been clearly recognized."

The President expressed his confidence that Congress can "constitutionally write an adequate farm act that will be well within the broad meaning and purpose of the Constitution."

And he said: "I hope and believe that the Supreme Court will not again deny to farmers the protection which it now accords to others."

I agree with President Roosevelt. Farmers and those who would serve the farmers' welfare should go ahead and work out plans that are, first of all, equitable and sound. In the long run public opinion will prevail, and it will support good laws, not half-baked measures written with one eye on the processors and the other eye on what the courts did before they saw the light.

From the standpoint of the farmer the battle that is now opening is really the old battle of "equality for agriculture." I do not know how long it will last. But I do know that if farmers cannot win back to "equal justice under law," then the future of our Nation is indeed dark.

This is the real issue: Is agriculture to have a fair chance or is it to become once more the Nation's forgotten industry? Temporarily, perhaps, the Nation can get along with farmers like serfs or peons supplying cheap food and cheap fiber for cheaply paid labor in the cities. But such a policy never has led and in the end never will lead to anything except disaster.

To adopt such a policy now would be to invite another smash-up.

I am not a defeatist. I do not believe that such a smash-up is inevitable. I am confident that the more far-sighted men and women of this Nation will prevail and that agriculture, along with labor and business, will get fair play.

But there is no question in my mind that farmers face a crisis. Either the gains of the last few years will be consolidated as enduring progress or else agriculture will go down hill.

Farmers will not attain to "equal justice under law" unless they fight for it.

There is only one way to win, and that is to keep an unbroken front in the fight. The wheat farmers of the West can never get a good wheat program, backed by the tax needed to make it a success, unless and until they have the wholehearted support of the southern cotton farmers. The cotton farmers can never get the kind of cotton program they want without the loyal help of the wheat farmers. And if the new farm bill should fail to give the protection of income that is so vital to farmers of the West and South, then the increased pressure upon available funds will surely weaken the program for the corn farmers, the dairy farmers, and other producers. So today, with renewed earnestness, I urge the wheat growers, cotton growers, corn growers, dairy farmers, tobacco farmers, rice growers, and all the other great producing groups to forget their minor differences and to unite in a solid farm front.

From the standpoint of both consumer and farmer, the stake in this fight neither begins nor ends with the farm. All of society stands to lose if the farm program fails, and to gain if it succeeds. The grain gambler alone profits when wheat prices soar and crash, and then soar and crash again. No one profits when the wheat farmers and consumers are made the victims of scarcity due to drought. No one profits when a tremendous surplus wrecks wheat prices. It is true that shocks like these fall upon the farmer first. But ultimately they hurt everyone. The housewife wants a steady supply of food at fair prices. The businessman, the manufacturer, the city worker depend on farm buying power for trade, for customers, for employment. Their interests and the farmers' interests are really one. The farmer must never forget his duty to the consumer, just as the consumer must always remember his debt to the farmer. The life of our democracy depends upon the unity of the groups in service of the general welfare. That unity and that service must be the foundation for the farm program of the future.

Milk and Cream Tests

EXTENSION OF REMARKS
OF
HON. JOHN LUECKE
OF MICHIGAN
IN THE HOUSE OF REPRESENTATIVES
Wednesday, December 8, 1937

LETTER FROM HON. JOHN LUECKE, OF MICHIGAN, TO W. A. AYRES, CHAIRMAN OF THE FEDERAL TRADE COMMISSION

Mr. LUECKE of Michigan. Mr. Speaker, under leave to extend my remarks in the RECORD, I include therein the following letter which I have written to the Honorable W. A. Ayres, Chairman of the Federal Trade Commission, Washington. The letter deals with the irregularities of milk tests which have come to my notice, and I am asking the Commission to look into the matter:

HOUSE OF REPRESENTATIVES,
Washington, D. C., December 8, 1937.

Hon. W. A. AYRES,
Chairman, Federal Trade Commission,
Washington, D. C.

MY DEAR MR. AYRES: During the recess of Congress, while I was back in my district, I had complaints made to me by farmers who were shipping milk to condenseries and cheese plants within the State and elsewhere. They complained to me that the tests they received did not compare favorably with the tests made by the county milk-testing associations.

Another complaint was that certain milk-processing plants in order to get their milk would, from all appearances, at the beginning give the farmer a high test and then after they had delivered their milk to these places for a short time the test would begin to drop.

I was also informed that the milk and cream test varied with the price of butterfat; that when the price of butterfat went up the tests went down.

Upon learning of these complaints I immediately got in touch with the State authorities and they sent inspectors into the district. The inspectors after finishing their work reported that they had discovered irregularities.

I should very much like to have the Federal Trade Commission concern itself in regard to milk and cream tests. I do not know whether or not the Commission has ever made inquiry into this matter, but I earnestly request that it seriously consider doing so.

I was also told that fly-by-night operators come into the State from adjoining States, transact business for various periods of time, and then depart suddenly, leaving the farmer to get his money in any way he can. I do not know whether or not there is any truth in that statement, but since it seemed to be quite common knowledge there must have been some reason for it, and I think the Commission should look into that also.

We are now concerning ourselves in Congress with an agricultural bill. That bill deals merely with certain commodities and in no way affects the dairy farmers. If the irregularities which I have pointed out in the foregoing sentences were done away with, I feel quite certain in saying that we would have rendered the milk producers of the Nation a great service.

I am calling this to your attention because of the knowledge I have concerning it, and I believe it is my duty to make an effort at having the Commission look into this phase of the dairy industry.

Yours very sincerely,

JOHN LUECKE,
Member of Congress.

Aircraft and the Merchant Marine

EXTENSION OF REMARKS
OF
HON. JOHN M. O'CONNELL
OF RHODE ISLAND
IN THE HOUSE OF REPRESENTATIVES
Wednesday, December 8, 1937

Mr. O'CONNELL of Rhode Island. Mr. Speaker, one cannot read the report submitted to Congress by the Honorable Joseph P. Kennedy, Chairman, Merchant Marine Commission, entitled "Aircraft and the Merchant Marine" without being impressed by the clever manner in which the subject of overseas air service is analyzed to favor flying boats.

American design, construction, and overseas operation of heavier-than-air craft have demonstrated an efficiency which warrant the expectation of further improvement being made to enable seaplanes to cross the Atlantic in nonstop flight with a reasonable pay load, but the 125-ton flying boats of "future design" are at present too visionary to be compared with 300-ton dirigibles which may be constructed now, when we need such craft to aid the expansion of our merchant-marine service.

The construction and successful commercial overseas operations of German Zeppelins have demonstrated the efficiency and value of lighter-than-air craft. Germany has also developed heavier-than-air craft, which with improvement should serve equally as well as our heavier-than-air craft, and will use both heavier-than-air and lighter-than-air craft with its merchant marine. The United States in supplying our helium gas to Germany aids in establishing German competition with our own merchant marine. The authorization to sell 17,900,000 cubic feet of helium gas to Germany for one 7,000,000-cubic-foot dirigible is a full supply for two such dirigibles for several years.

The Maritime Commission in its report does not present this fact to Congress, and further, the Commission indicates it favors the German-constructed dirigibles with which to establish an American overseas lighter-than-air aid to our merchant marine. To employ tax funds for constructing dirigibles in Germany and levy additional taxes for supplying relief to those who could be employed for constructing dirigibles in the United States we do not believe is a desirable method for expanding our own merchant marine.

It may not have been the intent of the Commission to favor German-constructed dirigibles, but the Commission's report refers to German construction and omits the consideration of American-constructed Zeppelin-type airships and of dirigibles of American design, which are approved by many leading American structural and aeronautical engineers.

The Commission may not appreciate the importance of the frame upon which the dirigible must rely for its strength, safety, and the term of its useful life, as well as for its efficiency, in commercial or military service. The Commission may not understand that of the two principles of engineering that are best adapted to the construction of dirigible frames,

those of the arch-frame bridge and of the suspension bridge, the suspension-bridge principles are superior.

The aeronautical adviser to the Commission attended the hearings on dirigible airships, on H. R. 2252, before the House Interstate and Foreign Commerce Committee, June 8, 1937. At these hearings a report on the relative merits of the Zeppelin frame and the American suspension-bridge type frame was submitted and discussed by Dr. David B. Steinman, of Robinson & Steinman, structural engineering consultants.

This report by Messrs. Robinson and Steinman was prepared for a client, and the work was accepted because it was within the type of engineering in which they specialized; they had no financial interest except to receive payment for their services.

Both Dr. Robinson and Dr. Steinman are accepted in world engineering circles as leaders in bridge design and construction of all types. To them a dirigible frame is just an adaptation of bridge construction principles, of the arch frame or the suspension bridges. Their record as designers or consultants on the design, engineers on the construction or advisers on the construction of about 50 percent of the great bridges in the United States and of many great bridges in foreign countries should indicate the value of their opinion.

The United States Maritime Commission is expected to be unbiased in its decisions and to be interested in all American improvements which may aid in establishing a first-class merchant marine for our Nation. The funds provided by Congress for the Commission's use are intended to benefit both industry and commerce of our Nation.

In Appendix No. 1 of Aircraft and the Merchant Marine, the American Zeppelin Transport, Inc., is credited with supplying the data on dirigibles. This company represents the German company and, it is understood, may employ either German-constructed dirigibles or dirigibles of the Zeppelin type constructed by the Goodyear-Zeppelin Corporation.

It has been stated the German-constructed *Hindenburg* cost approximately $2,500,000 in Germany, thus the cost of two 9,000,000 cubic feet dirigibles estimated at $7,200,000 and of two 10,000,000 cubic feet dirigibles estimated to cost $8,000,000 is in line with the increased cost of the larger sizes constructed in Germany.

These figures, contained in the Commission's report, may not apply to the same size dirigibles if constructed in the United States, for Mr. Litchfield, of the Goodyear Co., is reported to have stated in an interview published by the New York Times in 1936 that "To construct the *Hindenburg* in the United States may cost two and one-half times the cost of the $2,500,000 *Hindenburg* constructed in Germany.

The higher cost of constructing zeppelin-frame dirigibles in the United States is further indicated by an offer of the Goodyear Zeppelin Corporation to construct two 7,000,000 cubic feet dirigibles for the United States Government at a price of $10,750,000. This offer was submitted by Mr. Mitchell, Assistant Secretary of the Department of Commerce, to the Federal Aviation Commission in 1934, with the statement the Goodyear Zeppelin Corporation would be willing to lease the two airships and operate them in commercial service for 5 years, paying the Government the sum of $1 per year.

The Maritime Commission recommends that Congress place dirigibles upon the same basis as merchant marine vessels, under the 1936 Merchant Marine Act. Also recommends that responsibility for the economic development of overseas aircraft be lodged in the Maritime Commission and that Congress authorize the Commission to make loans of 75 percent of said aircrafts' cost.

Should Congress approve these recommendations, the Goodyear Zeppelin Corporation could submit a proposal to build two 10,000,000 cubic feet zeppelin frame dirigibles at $20,000,000 and the Commission could allot for such construction a cash subsidy of $10,000,000 on a cost differential basis and loan another $10,000,000 at low interest, or the Commission could make one loan of $15,000,000.

We do not think the Commission may approve a proposal of this kind, but its approval may be legal if its recommendations are approved by Congress. The sum of $20,000,000 would cover the cost of probably six 10,000,000 cubic feet dirigibles constructed in Germany, or of the same number of 10,000,000 cubic feet dirigibles, of the suspension bridge frame constructed in the United States.

It may be said the suspension bridge frame dirigibles have not been constructed nor have demonstrated flight. No large dirigibles have been constructed in the United States unless the Government supplied the full amount of their cost and flight demonstration. These dirigibles were destroyed as the result of structural weakness, in their design or construction.

A preeminent feature of the suspension bridge dirigible frame is its flexibility through which local stresses are automatically distributed to avoid fracture of any of the structural materials, and at the same time may provide the necessary rigidity required for sustained high speed and concentrated loads. Airships' frames of this type may be constructed of high-grade steel and have a useful life exceeding 20 years, as in the suspension bridge.

Messrs. Robinson and Steinman, in the preparation of their report submitted a complete design of a 6,500,000 cubic feet dirigible under the specifications by the Bureau of Aeronautics of the Navy Department, for the construction of the *Akron* and *Macon*. This report was available for study by the Maritime Commission, if it desired to examine same.

The report enumerated the advantages of the suspension bridge type frame as follows: Increase in pay load, more efficient use of material, greater inherent strength, decreased maintenance cost, increased length of life, ease of construction, simplicity, accuracy and definitness of calculation. The report included performance charts, (1) fuel consumption at speeds ranging from 40 miles per hour to 110 miles per hour, in winds ranging from 20 miles per hour "following winds," to 50 miles per hour "head winds," (2) speed-range chart of approximately 4,000 miles at 100 miles per hour to 20,000 miles at 40 miles per hour, and (3) speed-power chart showing 400 horsepower at 40 miles per hour, to 7,000 horsepower at 110 miles per hour.

The Robinson and Steinman report was supported before the House Commerce Committee by a report by the Guggenheim School of Aeronautics, New York University; by an endorsement of the Connecticut State Society of Professional Engineers, as a result of its independent study; by Dr. Max Munk, science consultant on aeronautics, and for many years was technical adviser to the National Advisory Committee for Aeronautics; and by other engineers who appeared before the Commerce Committee.

The Maritime Commission should be interested in this construction of American dirigibles, which may improve upon the German dirigibles and be constructed in the United States at no higher cost than Zeppelin dirigibles constructed in Germany, and in dirigibles capable of crossing the Atlantic to England in 36 hours, thus effecting three or possibly four crossings per week, transporting pay loads of 100 tons at a cost of approximately 20 cents per pound.

The cost of operating such dirigibles is conservatively estimated to not exceed $40,000 per crossing, or only 20 cents per pound, with a full load. The charges include administration and communications, fuel and oil, helium gas, crew, engine maintenance and replacement, terminal charges, contingencies, insurance, dirigible maintenance and depreciation, liquidation of construction cost, interest, and traffic solicitation and handling, all carefully estimated on a conservative basis.

In conclusion, I desire to state I am in full accord with the Commission in its opinion that both heavier-than-air and lighter-than-air craft may serve effectively with our merchant marine, with benefit to each. My criticisms intend no reflection on the Commission or its aeronautical adviser and are submitted as constructive information, which I feel the Maritime Commission should receive.

Wage and Hour Bill

EXTENSION OF REMARKS
OF
HON. HAMILTON FISH
OF NEW YORK
IN THE HOUSE OF REPRESENTATIVES
Wednesday, December 8, 1937

LETTER FROM WILLIAM GREEN, PRESIDENT OF THE AMERICAN FEDERATION OF LABOR, ON WAGE AND HOUR BILL; ALSO THE PROPOSED BILL

Mr. FISH. Mr. Speaker, under the leave to extend my remarks in the RECORD I include the following letter from William Green, president of the American Federation of Labor, on the wage and hour bill, together with a proposed bill supported by the American Federation of Labor:

AMERICAN FEDERATION OF LABOR,
Washington, D. C., December 7, 1937.

Hon. HAMILTON FISH, Jr.,
House Office Building, Washington, D. C.

DEAR SIR: I am herewith transmitting to you a copy of a wage and hour bill drafted and approved by the executive council of the American Federation of Labor. Your support of this measure is most earnestly requested by the American Federation of Labor.

This wage and hour bill embodies within it the recommendations submitted by President Roosevelt dealing with the principle of minimum-wage and maximum-hour legislation. Its provisions are clear-cut. It establishes a bottom for wages and a top for hours. It requires no administrative board or machinery to make it effective. Furthermore, it provides for quick punishment for any violation.

The American Federation of Labor is opposed to a complex system of Federal wage and hour regulation and its administration by a new Federal board. Our opposition to the creation of a minimum-wage board is based very largely upon the extremely disappointing and disillusioning experiences which labor has had with the National Labor Relations Board. The substitution of a Federal administrator with advisory boards or district wage boards under him would constitute but a very slight difference between that and a minimum-wage board.

The rates proposed in the American Federation of Labor wage and hour bill are not oppressive against any industry in any section of the country. No decent employer could object to paying workers $16 a week for 40 hours of labor. We believe that enlightened employers will hail such an advance in the sweated industries.

I ask you in behalf of the American Federation of Labor to support this wage and hour bill herein submitted as a substitute for pending hour and wage legislation.

Very sincerely yours,

WM. GREEN,
President, American Federation of Labor.

A bill to provide for the establishment of minimum labor standards in employments in and affecting interstate commerce, and for other purposes.

Be it enacted, etc.—

SECTION 1. (a) As used in this act unless the context otherwise requires—

(1) "Person" includes an individual, partnership, association, corporation, business trust, receiver, trustee, trustee in bankruptcy, or liquidating or reorganizing agent.

(2) "Interstate commerce" means trade, commerce, transportation, transmission, or communication among the several States, or into, or from any State to any place outside thereof.

(3) "State" means any State of the United States or the District of Columbia or any Territory or possession of the United States.

(4) "Occupation" means an occupation, industry, trade, or business, or branch thereof or class of work or craft therein in which persons are gainfully employed.

(5) "Employer" includes any person acting directly or indirectly in the interest of an employer in relation to an employee but shall not include the United States or any State or political subdivision thereof, or any labor organization (other than when acting as an employer), or anyone acting in the capacity of officer or agent of such labor organization.

(6) "Employee" includes any individual employed or suffered or permitted to work by an employer, but shall not include any person employed in a bona fide executive, administrative, professional, or local retailing capacity as outside salesmen nor shall "employees" include any person employed as a seaman, or any railroad employee subject to the provisions of the Hours of Service Act (U. S. C., title 45, ch. 3); or any employee of any common carrier by motor vehicle subject to the qualifications and maximum hours of service provisions of the Motor Carrier Act, 1935 (U. S. C., title 49, ch. 8): *Provided, however*, That the wage provisions of this act shall apply; or any air transport employee subject to the provisions of title II of the Railway Labor Act, approved April 10, 1936, or any person employed in the taking of fish, sea foods, or sponges; or any person employed in agriculture. As used in this act, the term "agriculture" includes farming in all its branches, and among other things includes the cultivation and tillage of the soil, dairying, forestry, horticulture, market-gardening, and the cultivation and growing of fruits, vegetables, nuts, nursery products, ferns, flowers, bulbs, livestock, bees, and poultry, and further includes the definition contained in subdivision (g) of section 15 of the Agricultural Marketing Act, approved June 15, 1929, as amended, or any other agricultural or horticultural commodity, and any practices performed by a farmer or on a farm as an incident to such farming operations, including delivery to market. Independent contractors and their employees engaged in transporting farm products from farm to market are not persons employed in agriculture. The term "person employed in agriculture" as used in this act, insofar as it shall refer to fresh fruits or vegetables, shall include persons employed within the area of production engaged in preparing, packing, or storing such fresh fruits or vegetables in their raw or natural state. *Provided, however*, that nothing in this section shall exclude from the operation of section II of this act persons employed in forestry or in the taking of fish, sea food, or sponges, or in the tapping or chipping of pine trees for crude gum or the collection or handling of gum spirits of turpentine or gum rosin.

(7) "Emergency work" means any work necessary for the protection or preservation of life or health, for the prevention of damage to property, or for maintenance or repair of property or equipment, or made necessary in the due course and conduct of production and to avoid undue disruption of business.

SEC. 2. It shall be unlawful to employ any person in any employment affecting interstate or foreign commerce at a wage less than 40 cents an hour, or at work in excess of 8 hours per day or more than 40 hours in any one week, or to employ any person under the age of 16 years for hire: *Provided*, That in case of emergency the provisions of this act shall not apply during the period of such emergency: *Provided*, Such employer affected file with the State labor commissioner or other proper State official designated by law a sworn statement as to the necessity for such action: *Provided further*, That such employer shall pay to his workers during such emergency wages of not less than time and one-half for work in excess of 8 hours per day or 40 hours in any one week.

SEC. 3. Any person in any State or Territory or possession of the United States or the District of Columbia guilty of violations of any of the provisions of this act shall be deemed guilty of a misdemeanor, and upon conviction shall be fined not less than $100 for each offense. The employment of each employee at a wage less than that fixed in this act, or for hours longer than those fixed in this act, unless excepted as provided in section 3, shall constitute a separate offense.

SEC. 4. The district courts of the United States and possessions shall have jurisdiction of the violations of this act. Any criminal proceeding may be brought in the district wherein any act or transaction constituting the violation or any element thereof occurred. The Attorney General of the United States may petition in district court having jurisdiction to issue, upon proper showing, a permanent injunction prohibiting further violations of this act by any defendant in any criminal proceeding. Any district court in the district wherein the defendant is an inhabitant or transacts business or where the violation of the act occurred has jurisdiction of said suits in equity. Judgments and decrees so rendered shall be subject to review as provided in sections 128 and 240 of the Judicial Act as amended (U. S. C. title 28, secs. 225 and 347, and D. C. Act, title 13, sec. 26). It shall be the duty of each United States District Attorney to whom satisfactory evidence of any violation of this act has been presented, to cause appropriate proceedings to be commenced and prosecuted in the proper court in the United States for the enforcement of the foregoing penalties or any of them.

SEC. 5. It shall be unlawful for any person to transport, offer to transport, or offer for transport, in interstate commerce, any goods in the production or processing of which any person so employed for longer hours per week or for less wages per hour or under the age of 16 for hire as provided in section 2 hereof when applicable.

SEC. 6. It shall be unlawful for any person to transport, offer to transport, or offer for transport, in interstate commerce, any goods in the production or processing of which convict, prison, forced, or indentured labor has entered.

SEC. 7. The provisions of this act shall not supersede any State law or municipal ordinance establishing a minimum wage higher than the wage established by this act, or maximum hours shorter than those established by this act.

SEC. 8. Any employer under a collective-bargaining contract with the union of his employees affiliated with a recognized, bona fide national labor organization providing for higher minimum wages and shorter maximum hours shall be exempted from the provisions of this act as to the employees covered by such agreement and insofar as the agreement covers hours and wages.

SEC. 9. All laws or parts of laws in conflict herewith are hereby repealed. Should any provision of this act be held unconstitutional by the Supreme Court of the United States, the other provisions shall not be affected by such decision.

SEC. 10. This act shall become effective 90 days after the enactment thereof.

Alexander Hamilton—Tariffs, Bounties, and Deficits

EXTENSION OF REMARKS

OF

HON. EDWARD A. KENNEY

OF NEW JERSEY

IN THE HOUSE OF REPRESENTATIVES

Friday, December 3, 1937

Mr. KENNEY. Mr. Speaker, it is keenly disappointing when, after much thought and long study and a feeling that you are right, the House of Representatives, having a contrary view, enacts legislation.

Such was my experience in 1934 upon the adoption of the securities exchange bill. As the only Member of the House to offer an amendment to reduce the margin requirement, I stood like Horatius at the bridge, warding off more attacks, but less effectively. My amendment was to reduce the margin requirement to 40 percent. In the course of the debate on the bill, among other things, I said:

> If Congress is to set a standard, let us set a standard that will be lived up to. We pass too many laws that are not lived up to and obeyed. I should like to see a standard below which we would never go, when it comes to the margin requirement.

And then I added:

> I predict right now that if this margin requirement is left in the bill it will only be a short time by necessity, if you are going to maintain a liquid market, when the Federal Reserve Board will lower the margin, and then the standard set by Congress will be exploited.

Recently the Federal Reserve Board did lower the margin requirement and lowered the margin to 40 percent, as proposed by my amendment.

The feeling that I was right still persists in view of the action of the Federal Reserve Board and the flow of events.

Again, to my chagrin, Congress deviated from my views when it passed the Revenue Act of 1936, imposing the undistributed surplus profit tax upon the business of the country. I voted against the bill and spoke against it during debate, hoping to avoid this tax which I felt would, as I said, in some degree clamp down and crack down on the backbone of the country's ordinary business, placing a burden upon business and the Nation.

In the light of the hue and cry for the repeal of this tax now, the sense that I was right upon that proposition still lingers with me.

And, Mr. Speaker, events convince me—as the arguments and remarks during debate on the pending farm bill convince me—that I am still right on my lottery bill.

The old query, "Where are we going to get the money?" looms up again even while the farm bill is being debated in the Congress.

The question assumes that there is bound to be a deficit—an unbalanced Budget—if we look to ordinary sources alone for revenue.

Why not, in the circumstances, turn to the philosophy of Alexander Hamilton, who because of his financial genius was chosen as the first Secretary of the Treasury of the United States, and still stands as a mountain peak among the financiers of the country's history?

The present farm bill is based upon the philosophy of Hamilton. The able chairman of the Agricultural Committee [Mr. JONES] so stated in opening the debate on the bill. Throughout the consideration of the bill it has been apparent that the distinguished gentleman from Texas in meeting all opposition has had uppermost in his mind the philosophy and theory of Hamilton, to wit, that manufacturers have an advantage over agriculture in the home market by reason of tariffs, and the bounties to agriculture are sometimes not only the best but the only proper expedient of equalizing the advantages of these two interests. Indeed, the chairman of the committee once quoted Hamilton to that effect, reading from his report on manufactures submitted by him as Secretary of the Treasury on December 5, 1791, wherein he advocated for the first time in the new country the principle of protection.

Yes, Mr. Speaker, Alexander Hamilton realized that politically free, as we are today, this country was confronted with the task, as we are today, of fighting for our economic independence. To that end Hamilton proposed a protective tariff for industry and a bounty for the farmers. But he did not stop there. He gave thought to deficits. He, too, asked himself, "Where are we going to get the money?"

Inasmuch as I had occasion to refer to the matter of deficits and Hamilton's philosophy when the Committee of the Whole House on the state of the Union had under consideration the Revenue Act of 1936, I include by leave of the House my remarks made April 23, 1936, which follow:

Mr. KENNEY. Mr. Chairman, our rehabilitation expenses have been staggering in their proportions. They were brought about, not by choice but through crucial necessity. I have heard the gentleman from Pennsylvania say many times, "Stop spending money," just as he has today. Then I have heard him ask for more money for flood relief in his region. I have heard other gentlemen on the other side say, "We can reduce expenditures by so many millions here and so many millions there," but not one of them tells us what to discontinue or what to stop. On the other hand, they have asked for an increase of expenditures for their emergencies. Again the gentleman from Pennsylvania [Mr. RICH] asks repeatedly, "Where are we going to get the money?" This tax bill is his answer. Of course, he does not like the answer. Nor do I. However, we have something to be thankful for. We find missing in this bill the processing taxes that were heralded. I have no quarrel with the windfall tax, because no one should unjustly enrich himself. But I do not favor the corporate surplus income tax because it is unnecessary.

Mr. Chairman, I hesitate to approve of the Government extending a heavy hand—a heavy tax hand—upon the business of the country. When the Government goes to business for its revenues, it ought to extend its hand lightly and not heavily, because when the Government intervenes in business inordinately it becomes a burden upon business and the country generally.

The gentleman from Pennsylvania in the course of his remarks said he believes in the principle that the man who makes the most should pay the most. That is not refuted; but the principle has been superseded by the practice during late years of the men who make the most paying the least or nothing at all. So the Congress undertook by a tax bill that is still young to cure that situation and to make all pay more—individuals, corporations, everyone.

You say the tax revenue from this bill is not enough. New exigencies arose, and now we have brought in here again another tax bill, this bill designed primarily to reach corporate surpluses. Even while it is in the making it is said this bill will not be sufficient to raise the amount of money that it is intended to raise; that next year we may expect another tax bill.

Oh, how long will this Congress continue to reach out and tap—and when you tap you sap the economic resources of this country. None of us want to dry up the resources, the bulwarks of our institutions. Neither do we wish to discourage employment. Better for business to employ our people than have our Government do it. Business can do it more satisfactorily and to better advantage. What effect the bill will have on employment is uncertain. But if we are to have the bill, then we ought to make it attractive for business to absorb the unemployed. To this end I would propose an amendment to section 23 of the bill granting an exemption from the taxes to be imposed of such corporate surplus income as should be the equivalent of all money paid out to new employees engaged on and after the date of the passage of the bill, with a limitation that the exemption not exceed 20 percent of the current pay roll and that the production of the plant be not increased over 5 percent.

If the House will harken to me, Mr. Chairman, the membership cannot help but feel with me that this tax bill is not at all necessary. The object of it is to raise approximately $1,000,000,000. It is for the Committee on Ways and Means and this House to say how we shall raise it. We can raise the money without resort to taxation. We can get the money from contributions—voluntary contributions—from all the people without hardship on anyone. We can strike out the enacting clause of this bill abandoning this corporation surplus income-tax measure and take up and pass my bill for a national lottery, which will give us the billion we seek.

With triple loads of National, State, and local taxes bearing down on our people, why do we not consider the efficacy of the

lottery? Why do we not go back to the period before we had any tax system of our own?

Take, for instance, the time when we were engaged in the great Revolutionary War. When money was scarce and hard to get and insufficient to carry on the war, George Washington fostered the lottery as a means to the end that we might become a free and independent people. He prevailed when the Continental Congress, in November 1776, adopted its historic resolution providing that the funds for the next campaign should be raised by lottery to be drawn in the city of Philadelphia.

When the war was won Alexander Hamilton, the first Secretary of the Treasury, proclaimed that having won our political independence we should forthwith establish our economic independence. As his contribution he proposed that we instruct our people in useful manufactures and pass effective legislation in their aid. His objectives were to supply the domestic market by means of a protective tariff and to follow through with a bid for world trade. Interesting important men of that time he selected the northern part of my State as the center of industry of our country, causing to be incorporated under the laws of the State of New Jersey the Society for Useful Manufactures, a corporation which is still in existence, proposing for it the power to conduct a lottery to raise not over $100,000 in any one year. Hamilton, in referring to his plan, said the lottery would give a ready command of money—and there is no question about that from our present-day experiences—and would make up for first unproductive efforts—deficits.

Our experts now are engaged to provide against deficits, and if we ponder sufficiently we shall find that the aristocrat of all deficiency measures, all emergency measures, has been and still is the lottery; for the lottery, when conducted by the Government, is nothing more nor less than a voluntary contribution on the part of the great body of the people ready and willing to make a gift to their Government in an emergency, and the emergency of a huge national debt and annual outlay is still with us. A national lottery in this country will make unnecessary any harm that may come from the enactment of this bill, and no tax bill can be passed which will not work hardship on some.

Of course it might not be amiss to tax great surpluses that make our business houses gigantic banks, but the process will in some degree clamp down and crack down on the backbone of the country's ordinary business, placing a burden upon business and the Nation.

Let me now remind this Congress, Mr. Chairman, that when the First Congress was called into session it had no meeting place. In the public dilemma the city of New York hospitably invited the Members to meet in the metropolis. So that they might have suitable arrangements and accommodations, the city improved and remodeled the city hall. As a result the city was faced with a deficit of £13,000, a huge amount of money in those days, and far beyond its power to pay. It could not be raised from ordinary sources, so the city went to the State legislature and secured permission for the operation of a lottery, which it conducted, and from its proceeds quickly paid its bill.

Again, when it was undertaken to construct the first buildings in the District of Columbia, this Congress gave the city of Washington the power to conduct a lottery for the purpose. That was in 1795. Washington was President and John Adams was Secretary of State. When the buildings were dedicated in 1800, John Adams, then President, praised in glowing terms the virtues of the citizens of the country who by their lottery participation had made possible the nucleus of this great Capital.

O Mr. Chairman, do you know that at the present time our people are participating in lotteries more than ever before in the history of the Nation. Between three and six billion dollars a year flow into channels that do not come within our economic realm, and if we are going to tap and harness any funds to meet our expenses, let us go beyond the economic sources, already strained, and harness and garner the moneys that are being lost to our country, our Government, and legitimate business, and make them serve our economic purposes.

Our lottery moneys are now going into the hands of racketeers and organized criminals at home or are finding their way to foreign countries. Billions are involved—billions. Let us reflect, too, on the fact that every form of government in the world has in operation a lottery conducted by or under the auspices of the Government for worthy and needed purposes.

Yet we are standing idly by failing to take cognizance of the large, huge amounts of money that are passing from us when they are so necessary for the welfare of our own people.

The people of this country are ready and willing, as in all crises, to contribute small amounts of money which will aggregate a billion net to the Government for the purpose of surging forward on the road of sound economic recovery.

Business has gone ahead. It is ready to make further strides. We must not load it down with excessive taxation. Let us rather lighten the load. We have made great progress. Business is cooperating more and more every day. This cooperation is slowly but surely lifting the load of the Government. Let us give business another hand; let us reach out for the huge treasure of lottery moneys to help with the burden; let us recommit this bill and vote the national lottery bill, and thus raise the revenue sought by this bill, bringing into the economic realm the billions of dollars lost to us yearly to be employed for the economic use and welfare of our people. [Applause.]

Farm Relief

EXTENSION OF REMARKS
OF
HON. R. T. BUCKLER
OF MINNESOTA
IN THE HOUSE OF REPRESENTATIVES
Tuesday, December 7, 1937

RESOLUTION ADOPTED BY THE BOARD OF DIRECTORS OF THE HENNING FARMERS CREAMERY ASSOCIATION

Mr. BUCKLER of Minnesota. Mr. Speaker, under the leave to extend my remarks in the RECORD, I include the following resolution adopted by the board of directors of the Henning Farmers Creamery Association at a regular meeting held in Henning, Minn., November 23, 1937:

Resolution adopted by the board of directors of the Henning Farmers Creamery Association at a regular meeting held in Henning, Minn., November 23, 1937

Whereas the deflation of the farmer began after the World War; and

Whereas all fixed prices on farm products were withdrawn; and

Whereas the same conditions have prevailed up to the present administration; and

Whereas the administration has enacted certain and various set-ups to aid and relieve the deplorable situation of the farmer; and

Whereas farm products and their prices are manipulated, not by the law of supply and demand, but by monopolists—national and international—to such an extent as to cause ruinous low prices for farm commodities; and

Whereas the farmer is forced to market the products of the farm regardless of prices at this season of the year to meet taxes, interest, and other obligations of the year; and

Whereas the present market price of farm products is far below the cost of production; and

Whereas under such conditions the farmer is deprived of the necessities and upkeep of farm requirements; and

Whereas the decline in the market price of farm products is not reflected in the retail price of the finished product to the consumer; and

Whereas industry is not forced to compete with prices set in world markets for that portion consumed domestically; and there being no valid or possible reason why the American farmer be forced to compete with prices set in world markets for that portion consumed domestically: Therefore be it

Resolved, That the board of directors and patrons of the Henning Farmers Creamery Association, of Henning, Otter Tail County, State of Minnesota, do hereby petition the Congress of the United States to enact immediately such program as endorsed at the Minnesota Farm Conference, October 4, 1937, at St. Paul, Minn.; namely, basic price of farm commodities, surplus pool, ever-normal granary, crop insurance, soil conservation, cut-in-price spread, farm tenancy, refinancing of farm debts at very low interest rates, aid to catastrophe victims, aid to cooperative movement, and cooperation between the farmer and the laborer; and be it further

Resolved, That copies of these resolutions be sent to the President of the United States, our Members of Congress, and to the Secretary of Agriculture, Henry A. Wallace.

Agrarian Justice

EXTENSION OF REMARKS
OF
HON. USHER L. BURDICK
OF NORTH DAKOTA
IN THE HOUSE OF REPRESENTATIVES
Tuesday, December 7, 1937

COPY OF AN ADDRESS BY THOMAS PAINE IN 1796 ON THE FARM QUESTION

Mr. BURDICK. Mr. Speaker, under leave granted to me on the 7th day of December to extend my remarks, including therein a speech made by Thomas Paine in 1796 on the farm question, I desire to say that this great thinker of the days of the American Revolution, over 140 years ago, understood

the farm question and the old-age pension questions so thoroughly then that his speech might well be made today in this House, and every word uttered in it would apply to the question which today we are trying to answer.

This speech, if made today, would also take first place over any utterance which has been made in this long debate in this House. It was for this reason that I asked permission to have the speech reproduced at this time for the benefit of the membership and the country at large. Here follows the speech:

BY THOMAS PAINE, AUTHOR OF COMMON SENSE, RIGHTS OF MAN, AGE OF REASON, ETC.

(Agrarian justice opposed to agrarian law and to agrarian monopoly, being a plan for meliorating the condition of man by creating in every nation a national fund to pay to every person, when arrived at the age of 21 years, the sum of £15, to enable him or her to begin the world. And also £10 per annum during life to every person now living at the age of 50 years, and to all others when they shall arrive at that age, to enable them to live in old age without wretchedness and go decently out of the world.)

PREFACE

The following little piece was written in the winter of 1795–96, and as I had not determined whether to publish it during the present war, or to wait until the commencement of a peace, it has lain by me, without alteration or addition, from the time it was written.

What has determined me to publish it now is a sermon preached by Watson, bishop of Landaff. Some of my readers will recollect that this bishop wrote a book entitled "An Apology for the Bible" in answer to my second part of the Age of Reason. I procured a copy of this book, and he may depend upon hearing from me on that subject.

At the end of the bishop's book is a list of the works he has written, among which is the sermon alluded to. It is entitled "The Wisdom and Goodness of God in Having Made Both Rich and Poor; With an Appendix, Containing Reflections on the Present State of England and France."

The error contained in the title of this sermon determined me to publish my agrarian justice. It is wrong to say that God made rich and poor; He made only male and female; and He gave them the earth for their inheritance.

* * * * * * *

Instead of preaching to encourage one part of mankind in insolence.

* * * * * * *

* * * It would be better that priests employed their time to render the general condition of man less miserable than it is. Practical religion consists in doing good; and the only way of serving God is that of endeavoring to make his creation happy. All preaching that has not this for its object is nonsense and hypocrisy.

THOMAS PAINE.

AGRARIAN JUSTICE OPPOSED TO AGRARIAN MONOPOLY—BEING A PLAN FOR MELIORATING THE CONDITION OF MAN, ETC.

To preserve the benefits of what is called civilized life, and to remedy, at the same time, the evil it has produced, ought to be considered as one of the first objects of reformed legislation.

Whether that state is proudly, perhaps erroneously, called civilization, has most promoted or most injured the general happiness of man, is a question that may be strongly contested. On one side the spectator is dazzled by splendid appearances; on the other, he is shocked by extremes of wretchedness; both of which he has erected. The most affluent and the most miserable of the human race are to be found in the countries that are called civilized.

To understand what the state of society ought to be, it is necessary to have some idea of the natural and primitive state of man; such as it is at this day among the Indians of North America. There is not, in that state, any of those spectacles of human misery which proverty and want present to our eyes, in all the towns and streets of Europe. Poverty, therefore, is a thing created by that which is called civilized life. It exists not in the natural state. On the other hand, the natural state is without those advantages which flow from agriculture, arts, science, and manufactures.

The life of an Indian is a continual holiday compared with the poor of Europe; and, on the other hand, it appears to be abject when compared to the rich. Civilization, therefore, or that which is so called, has operated two ways, to make one part of society more affluent and the other part more wretched than would have been the lot of either in a natural state.

It is always possible to go from the natural to the civilized state, but it is never possible to go from the civilized to the natural state. The reason is that man, in a natural state, subsisting by hunting, requires 10 times the quantity of land to range over to procure himself sustenance than would support him in a civilized state, where the earth in cultivated. When, therefore, a country becomes populous by the additional aids of cultivation, arts, and science, there is a necessity of preserving things in that state, because without it there cannot be sustenance for more, perhaps, than a tenth part of its inhabitants. The thing, therefore, now to be done is to remedy the evils and preserve the benefits that have arisen to society by passing from the natural to that which is called the civilized state.

Taking then the matter up on this ground, the first principle of civilization ought to have been, and ought still to be, that the condition of every person born into the world, after a state of civilization commences, ought not to be worse than if he had been born before that period. But the fact is that the condition of millions in every country in Europe is far worse than if they had been born before civilization began or had been born among the Indians of North America of the present day. I will show how this fact has happened.

It is a position not to be controverted that the earth, in its natural uncultivated state, was, and ever would have continued to be, the common property of the human race. In that state every man would have been born to property. He would have been a joint life proprietor with the rest in the property of the soil and in all its natural productions, vegetable and animal.

But the earth, in its natural state, as before said, is capable of supporting but a small number of inhabitants compared with what it is capable of doing in a cultivated state. And as it is impossible to separate the improvement made by cultivation from the earth itself, upon which that improvement is made, the idea of landed property arose from that inseparable connection; but it is nevertheless true that it is the value of the improvement only, and not the earth itself, that is individual property. Every proprietor, therefore, of cultivated land owes to the community a ground rent—for I know no better term to express the idea by—for the land which he holds, and it is from this ground rent that the fund proposed in this plan is to issue.

It is deducible, as well from the nature of the thing as from all the histories transmitted to us, that the idea of landed property commenced with cultivation, and that there was no such thing as landed property before that time. It could not exist in the first state of man, that of hunters. It did not exist in the second state, that of shepherds. Neither Abraham, Isaac, Jacob, nor Job, so far as the history of the Bible may be credited in probable things, were owners of land. Their property consisted, as is always enumerated, in flocks and herds, and they traveled with them from place to place. The frequent contentions at that time about the use of a well in the dry country of Arabia, where those people lived, show also there was no landed property. It was not admitted that land could be located as property.

There could be no such thing as landed property originally. Man did not make the earth, and, though he had a natural right to occupy it, he had no right to locate his property in perpetuity or any part of it; neither did the Creator of the earth open a land office, from whence the first title deeds should issue. From whence, then, arose the idea of landed property? I answer as before, that when cultivation began, the idea of landed property began with it, from the impossibility of separating the improvement made by cultivation from the earth itself, upon which this improvement was made. The value of the improvement so far exceeded the value of the natural earth at that time as to absorb it, till in the end the common right of all became confounded into the cultivated right of the individual. But they are, nevertheless, distinct species of rights and will continue to be so as long as the earth endures.

It is only by tracing things to their origin that we can gain rightful ideas of them, and it is by gaining such ideas that we discover the boundary that divides right from wrong, and which teaches every man to know his own. I have entitled this tract agrarian justice, to distinguish it from agrarian law. Nothing could be more unjust than agrarian law in a country improved by cultivation, for though every man, as an inhabitant of the earth, is a joint proprietor of it in its natural state, it does not follow that he is a joint proprietor of cultivated earth. The additional value made by cultivation, after the system was admitted, became the property of those who did it, or who inherited it from them, or who purchased it. It had originally an owner. Whilst, therefore, I advocate the right, and interest myself in the hard case of all those who have been thrown out of their natural inheritance by the introduction of the system of landed property, I equally defend the right of the possessor to the part which is his.

Cultivation is, at least, one of the greatest natural improvements ever made by human invention. It has given to created earth a tenfold value. But the landed monopoly, that began with it, has produced the greatest evil. It has dispossessed more than half the inhabitants of every nation of their natural inheritance, without providing for them, as ought to have been done, as an indemnification for that loss, and has thereby created a species of poverty and wretchedness that did not exist before.

In advocating the case of the persons thus dispossessed, it is a right and not a charity that I am pleading for. But it is that kind of right, which, being neglected at first, could not be brought forward afterwards, till heaven had opened the way by a revolution in the system of government. Let us then do honor to revolutions by justice and give currency to their principles by blessings.

Having thus in a few words opened the merits of the case, I proceed to the plan I have to propose which is:

To create a National Fund, out of which there shall be paid to every person, when arrived at the age of 21 years, the sum of £15 as a compensation in part for the loss of his or her natural inheritance by the introduction of the system of landed property.

And also—

The sum of £10 per annum, during life, to every person now living, of the age of 50 years, and to all others as they shall arrive at that age.

MEANS BY WHICH THIS FUND IS TO BE CREATED

I have already established the principle, namely, that the earth, in its natural uncultivated state, was, and ever would have continued to be, the common property of the human race—that in that state, every person would have been born to property—and that the system of landed property, by its inseparable connection with cultivation, and with what is called civilized life, has absorbed the property of all those whom it dispossessed, without providing, as ought to have been done, an indemnification for that loss.

The fault, however, is not in the present possessors. No complaint is intended, or ought to be alleged against them, unless they adopt the crime of opposing justice. The fault is in the system, and it has stolen imperceptibly upon the world, aided afterward by the Agrarian law of the sword. But the fault can be made to reform itself by successive generations, without diminishing or deranging the property of any of the present possessors, and yet the operation of the fund can commence, and be in full activity, the first year of its establishment, or soon after, as I shall show.

It is proposed that the payments as already stated, be made to every person, rich or poor. It is best to make it so, to prevent invidious distinctions. It is also right it should be so, because it is in lieu of the natural inheritance, which, as a right, belongs to every man, over and above the property he may have created or inherited from those who did. Such persons as do not choose to receive it, can throw it into the common fund.

Taking it then for granted, that no person ought to be in a worse condition when born under what is called a state of civilization than he would have been had he been born in a state of nature and that civilization ought to have made and ought still to make provision for that purpose it can only be done by subtracting from property a portion equal in value to the natural inheritance it has absorbed.

Various methods may be proposed for this purpose but that which appears to be the best not only because it will operate without deranging any present possessors or without interfering with the collection of taxes or emprunts necessary for the purpose of government and the revolution but because it will be the least troublesome and the most effectual and also because the subtraction will be made at a time that best admits it which is at the moment that property is passing by the death of one person to the possession of another. In this case the bequeather gives nothing; the receiver pays nothing. The only matter to him is that the monopoly of natural inheritance to which there never was a right begins to cease in his person. A generous man would not wish it to continue and a just man will rejoice to see it abolished.

My state of health prevents my making sufficient inquiries with respect to the doctrine of probabilities, whereon to found calculations with such degrees of certainty as they are capable of. What, therefore, I offer on this head is more the result of observation and reflection than of received information; but I believe it will be found to agree sufficiently enough with fact.

In the first place, taking 21 years as the epoch of maturity, all the property of a nation, real and personal, is always in the possession of persons above that age. It is then necessary to know, as a datum of calculation, the average of years which persons above that age will live. I take this average to be about 30 years; for though many persons will live 40, 50, or 60 years after the age of 21 years, others will die much sooner, and some in every year of that time.

Taking, then, 30 years as the average of time it will give without any material variation one way or other the average of time in which the whole property or capital of a nation or a sum equal thereto will have passed through one entire revolution in descent, that is, will have gone by deaths to new possessors, for though, in many instances, some parts of this capital will remain 40, 50, or 60 years in the possession of one person, other parts will have revolved two or three times before that 30 years expire, which will bring it to that average; for were one-half the capital of a nation to revolve twice in 30 years, it would produce the same fund as if the whole revolved once.

Taking, then, 30 years as the average of time in which the whole capital of a nation, or a sum equal thereto, will revolve once, the thirtieth part thereof will be the sum that will revolve every year, that is, will go by deaths to new possessors; and this last sum being thus known, and the ratio percent to be subtracted from it being determined, will give the annual amount of income of the proposed fund, to be applied as already mentioned.

In looking over the discourse of the English Minister Pitt in his opening of what is called in England, the budget (the scheme of finance for the year 1796), I find an estimate of the national capital of that country. As this estimate of a national capital is prepared ready to my hand, I take it as a datum to act upon. When a calculation is made upon the known capital of any nation, combined with its population, it will serve as a scale for any other nation, in proportion as its capital and population be more or less. I am the more disposed to take this estimate of Mr. Pitt, for the purpose of showing to that Minister, upon his own calculation, how much better money may be employed, than in wasting it, as he has done, on the wild project of setting up Bourbon kings. What, in the name of Heaven, are Bourbon kings to the people of England? It is better that the people have bread.

Mr. Pitt states the national capital of England, real and personal, to be 1,300,000,000 sterling, which is about one-fourth part of the national capital of France, including Belgia. The event of the last harvest in each country proves that the soil of France is more productive than that of England, and that it can better support 24 or 25 millions of inhabitants than that of England can 7, or 7½.

The thirtieth part of this capital of £1,300,000,000 is £43,333,333, which is the part that will revolve every year by deaths in that country to new possessors; and the sum that will annually revolve in France in the proportion of 4 to 1, will be about £173,000,000. From this sum of £43,333,333 annually revolving, is to be substracted the value of the natural inheritance absorbed in it, which perhaps, in fair justice, cannot be taken at less, and ought not to be taken for more, than a tenth part.

It will always happen that of the property thus revolving by deaths every year part will descend in a direct line to sons and daughters, and the other part collaterally, and the proportion will be found to be about 3 to 1; that is, about £30,000,000 of the sum will descend to direct heirs and the remaining sum of £13,333,333 to more distant relations, and part to strangers.

Considering then that man is always related to society, that relationship will become comparatively greater in proportion as the next of kin is more distant. It is therefore consistent with civilization to say that where there are no direct heirs society shall be heir to a part over and above the tenth part due to society. If this additional part be from 5 to 10 or 12 percent in proportion as the next of kin be nearer or more remote, so as to average with the escheats that may fall, which ought always to go to society and not to the Government, in addition, of 10 percent more, the produce from the annual sum of £43,333,333 will be—

From £30,000,000 at 10 percent	£3,000,000
From £13,333,333 at 10 percent with the addition of 10 percent more	2,666,666
£43,333,333	5,666,666

Having thus arrived at the annual amount of the proposed fund, I come, in the next place, to speak of the population proportioned to this fund, and to compare it with uses to which the fund is to be applied.

The population (I mean that of England) does not exceed seven millions and a half, and the number of persons above the age of 50 will in that case be about 400,000. There would not, however, be more than that number that would accept the proposed 10 pounds sterling per annum, though they would be entitled to it. I have no idea it would be accepted by many persons who had a yearly income of two or three hundred pounds sterling. But as we often see instances of rich people falling into sudden poverty, even at the age of 60, they would always have the right of drawing all the arrears due to them. Four millions, therefore, of the above annual sum of £5,666,666 will be required for 400,000 aged persons, at 10 pounds sterling each.

I come now to speak of the persons annually arriving at 21 years of age. If all the persons who died were above the age of 21 years, the number of persons annually arriving at that age must be equal to the annual number of deaths to keep the population stationary. But the greater part die under the age of 21, and, therefore, the number of persons annually arriving at 21 will be less than half the number of deaths. The whole number of deaths upon a population of seven millions and a half will be about 220,000 annually. The number arriving at 21 years of age will be about 100,000. The whole number of these will not receive the proposed £15, for the reasons already mentioned, though, as in the former case, they would be entitled to it. Admitting, then, that a tenth part declined receiving it, the amount would stand thus:

Fund annually		£5,666,666
To 400,000 aged persons at £10 each	£4,000,000	
To 90,000 persons of 21 years, £15 each	1,350,000	
		5,350,000
Remains		316,666

There are in every country a number of blind and lame persons, totally incapable of earning a livelihood. But as it will always happen that the greater number of blind persons will be among those who are above the age of 50 years, they will be provided for in that class. The remaining sum of £316,666 will provide for the lame and blind under that age, at the same rate of £10 annually for each person.

Having now gone through all the necessary calculations and stated the particulars of the plan I shall conclude with some observations.

It is not charity but a right, not bounty but justice, that I am pleading for. The present state of what is called civilization is * * *. It is the reverse of what it ought to be, and * * *. The contrast of affluence and wretchedness continually meeting and offending the eye is like dead and living bodies chained together. Though I care as little about riches as any man, I am a friend to riches because they are capable of good. I care not how affluent some may be, provided that none be miserable in consequence of it. But it is impossible to enjoy affluence with the felicity it is capable of being enjoyed whilst so much misery is mingled in the scene. The fight of the misery and the unpleasant sensations it suggests, which, though they may be suffocated cannot be extinguished, are a greater drawback upon the felicity of affluence than the proposed 10 percent upon property is worth. He

that would not give the one to get rid of the other has no charity, even for himself.

There are in every country some magnificent charities established by individuals. It is, however, but little that any individual can do when the whole extent of the misery to be relieved be considered. He may satisfy his conscience, but not his heart. He may give all that he has and that all will relieve but little. It is only by organizing civilization upon such principles as to act like a system of pullies that the whole weight of misery can be removed.

The plan here proposed will reach the whole. It will immediately relieve and take out of view three classes of wretchedness—the blind, the lame, and the aged poor—and it will furnish the rising generation with means to prevent their becoming poor; and it will do this without deranging or interfering with any national measures. To show that this will be the case it is sufficient to observe that the operation and effect of the plan will in all cases be the same—as if every individual were voluntary to make his will and dispose of his property in the manner here proposed.

But it is justice and not charity that is the principle of the plan. In all great cases it is necessary to have a principle more universally active than charity; and with respect to justice, it ought not to be left to the choice of detached individuals whether they will do justice or not. Considering then the plan on the ground of justice, it ought to be the act of the whole, growing spontaneously out of the principles of the revolution, and the reputation of it to be national and not individual.

A plan upon this principle would benefit the revolution by the energy that springs from the consciousness of justice. It would multiply also the national resources, for property, like vegetation, increases by offsets. When a young couple begin the world, the difference is exceedingly great whether they begin with nothing or with 15 pounds apiece. With this aid they could buy a cow and implements to cultivate a few acres of land; and, instead of becoming burdens upon society, which is always the case where children are produced faster than they can be fed, would be put in the way of becoming useful and profitable citizens. The national domains also would sell the better if pecuniary aids were provided to cultivate them in small lots.

It is the practice of what has unjustly obtained the name of civilization (and the practice merits not to be called either charity or policy) to make some provision for persons becoming poor and wretched, only at the time they become so. Would it not, even as a matter of economy, be far better to devise means to prevent their becoming poor? This can best be done by making every person, when arrived at the age of 21 years, an inheritor of something to begin with. The rugged face of society, checkered with the extremes of affluence and of want, proves that some extraordinary violence has been committed upon it and calls upon justice for redress. The great mass of the poor in all countries are become an hereditary race, and it is next to impossible for them to get out of that state of themselves. It ought also to be observed that this mass increases in all countries that are called civilized. More persons fall annually into it than get out of it.

Though in a plan, in which justice and humanity are the foundation principles, interest ought not to be admitted into the calculation, yet it is always of advantage to the establishment of any plan to show that it is beneficial as a matter of interest. The success of any proposed plan submitted to the public consideration must finally depend on the numbers interested in supporting it, united with the justice of its principles.

The plan here proposed will benefit all without injuring any. It will consolidate the interest of the Republic with that of the individual. To the numerous class dispossessed of their natural inheritance by the system of landed property it will be an act of national justice. To persons dying possessed of moderate fortunes it will operate as a tontine to their children, more beneficial than the sum of money paid into the fund, and it will give to the accumulation of riches a degree of security that none of the governments of Europe, now tottering on their foundations, can give.

I do not suppose that more than 1 family in 10, in any of the countries of Europe, has, when the head of the family dies, a clear property left of 500 pounds sterling. To all such the plan is advantageous. That property would pay 50 pounds into the fund, and if there were only two children under age they would receive 15 pounds each—30 pounds—on coming of age, and be entitled to 10 pounds a year after 50. It is from the overgrown acquisition of property that the fund will support itself; and I know that the possessors of such property in England, though they would eventually be benefited by the protection of nine-tenths of it, will exclaim against the plan. But, without entering into any inquiry how they came by that property, let them recollect that they have been the advocates of this war, and that Mr. Pitt has already laid on more new taxes to be raised annually upon the people of England, and that for supporting the despotism of Austria and the Bourbons against the liberties of France they would annually pay all the sums proposed in this plan.

I have made the calculations, stated in this plan, upon what is called personal, as well as upon landed property. The reason for making it upon land is already explained; and the reason for taking personal property into the calculation, is equally well founded, though on a different principle. Land, as before said, is the free gift of the Creator in common to the human race. Personal property is the effect of society; and it is as impossible for an individual to acquire personal property without the aid of society as it is for him to make land originally. Separate an individual from society, and give him an island or a continent to possess, and he cannot acquire personal property. He cannot become rich. So inseparably are the means connected with the end in all cases that where the former do not exist the latter cannot be obtained. All accumulation, therefore, of personal property, beyond what a man's own hands produce, is derived to him by living in society; and he owes, on every principle of justice, of gratitude, and of civilization, a part of that accumulation back again to society from whence the whole came. This is putting the matter on a general principle, and perhaps it is best to do so; for if we examine the case minutely it will be found that the accumulation of personal property is, in many instances, the effect of paying too little for the labor that produced it; the consequence of which is that the working hand perishes in old age, and the employer abounds in affluence. It is, perhaps, impossible to proportion exactly the price of labor to the profits it produces; and it will also be said, as an apology for injustice, that were a workman to receive an increase of wages daily he would not save it against old age, nor be much the better for it in the interim. Make, then, society the treasurer, to guard it for him in a common fund, for it is no reason, that because he might not make a good use of it for himself, that another shall take it.

The state of civilization that has prevailed throughout Europe is as unjust in its principle as it is horrid in its effects; and it is the consciousness of this, and the apprehension that such a state cannot continue, when once investigation begins in any country, that makes the possessors of property dread every idea of a revolution. It is the hazard and not the principles of a revolution that retards their progress. This being the case, it is necessary as well for the protection of property, as for the sake of justice and humanity, to form a system, that whilst it preserves one part of society from wretchedness, shall secure the other from depredation.

The superstitious awe, the enslaving reverence, that formerly surrounded affluence is passing away in all countries, and leaving the possessor of property to the convulsion of accidents. When wealth and splendor, instead of fascinating the multitude, excite emotions of disgust; when, instead of drawing forth admiration, it is beheld as an insult upon wretchedness, when the ostentatious appearance it makes serves to call the right of it in question, the case of property becomes critical, and it is only in a system of justice that the possessor can contemplate security.

To remove the danger, it is necessary to remove the antipathies, and this can only be done by making property productive of a national blessing, extending to every individual. When the riches of one man above another shall increase the national fund in the same proportion, when it shall be seen that the prosperity of that fund depends on the prosperity of individuals, when the more riches a man acquires, the better it shall be for the general mass, it is then that antipathies will cease and property be placed on the permanent basis of national interest and protection.

I have no property in France to become subject to the plan I propose. What I have, which is not much, is in the United States of America. But I will pay £100 sterling toward this fund in France the instant it shall be established; and I will pay the same sum in England, whenever a similar establishment shall take place in that country.

A revolution in the state of civilization is the necessary companion of revolutions in the system of government. If a revolution in any country be from bad to good, or from good to bad, the state of what is called civilization in that country must be made conformable thereto to give that revolution effect. Despotic government supports itself by abject civilization, in which debasement of the human mind and wretchedness in the mass of the people are the chief criterions. Such governments consider man merely as an animal; that the exercise of intellectual faculty is not his privilege; that he has nothing to do with the laws but to obey them;[1] and they politically depend more upon breaking the spirit of the people by poverty than they fear enraging it by desperation.

It is a revolution in the state of civilization that will give perfection to the revolution of France. Already the conviction that government, by representation, is the true system of government, is spreading itself fast in the world. The reasonableness of it makes itself felt even by its opposers. But when a system of civilization, growing out of that system of government, shall be so organized, that not a man or woman born in the republic but shall inherit some means of beginning the world, and see before them the certainty of escaping the miseries that under other governments accompany old age, the revolution of France will have an advocate and an ally in the heart of all nations.

An army of principles will penetrate where an army of soldiers cannot. It will succeed where diplomatic management will fail. It is neither the Rhine, the channel, nor the ocean that can arrest its progress. It will march on the horizon of the world, and it will conquer.

THOMAS PAINE.

Means for carrying the proposed plan into execution, and to render it at the same time conducive to the public interest.

I

Each canton shall elect, in its primary assemblies, three persons as commissioners for that canton, who shall take cognizance and keep a register of all matters happening in that canton conformable to the charter that shall be established by law for carrying this plan into execution.

---

[1] An expression of Horsley, an English bishop, in the English Parliament.

II

The law shall fix the manner in which the property of deceased persons shall be ascertained.

III

When the amount of the property of any deceased person shall be ascertained, the principal heir to that property, or the eldest of the coheirs, if of lawful age, or if under age, the person authorized by the will of the deceased to represent him, or them, shall give bond to the commissioners of the canton, to pay the said tenth part thereof within the space of 1 year, in four equal quarterly payments, or sooner, at the choice of the payers. One-half of the whole property shall remain as security until the bond is paid off.

IV

The bond shall be registered in the office of the commissioners of the canton, and the original bonds shall be deposited in the national bank of Paris. The bank shall publish every quarter of a year the amount of the bonds in possession, and also the bonds that shall have been paid off, or what parts thereof, since the last quarterly publication.

V

The national bank shall issue bank notes upon the security of the bonds in its possession. The notes so issued, shall be applied to pay the pensions of aged persons, and the compensations to persons arriving at 21 years of age. It is both reasonable and generous to suppose, that persons not under immediate necessity, will suspend their right of drawing on the fund, until it acquire, as it will do, a greater degree of ability. In this case, it is proposed that an honorary register to be kept in each canton, of the names of the persons thus suspending that right, at least during the present war.

VI

As the inheritors of property must always take up their bonds in four quarterly payments, or sooner if they choose, there will always be numeraire arriving at the bank after the expiration of the first quarter, to exchange for the bank notes that shall be brought in.

VII

The bank notes being thus got into circulation, upon the best of all possible security, that of actual property, to more than four times the amount of the bonds upon which the notes are issued, and with numeraire continually arriving at the bank to exchange or pay them off whenever they shall be presented for that purpose, they will acquire a permanent value in all parts of the republic. They can therefore be received in payments of taxes or emprunts, equal to numeraire, because the Government can always receive numeraire for them at the bank.

VIII

It will be necessary that the payments of the 10 percent be made in numeraire for the first year, from the establishment of the plan. But after the expiration of the first year, the inheritors of property may pay the 10 perceut either in bank notes issued upon the fund, or in numeraire. If the payments be in numeraire, it will lie as a deposit at the bank, to be exchanged for a quantity of notes equal to that amount; and if in notes issued upon the fund, it will cause a demand upon the fund equal thereto; and thus the operation of the plan will create means to carry itself into execution.

Agriculture, Business, Labor, and Government

EXTENSION OF REMARKS

OF

HON. CLYDE L. HERRING

OF IOWA

IN THE SENATE OF THE UNITED STATES

Thursday, December 9 (legislative day of Tuesday, November 16), 1937

RADIO ADDRESS BY HON. HENRY A. WALLACE, SECRETARY OF AGRICULTURE

Mr. HERRING. Mr. President, I ask unanimous consent to have published in the RECORD a radio address delivered on the 6th instant by Hon. Henry A. Wallace, Secretary of Agriculture, relative to the mutual problems of agriculture, business, and labor, and the way in which Government can help all three.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

Tonight I want to talk about the mutual problems of agriculture, business, and labor, and the way in which Government can help all three. I especially want to talk about the interest of these three groups in constructive steps to counteract the business recession that has set in.

Farmers of the United States, in this closing month of 1937, realize their dependence on other groups and other nations more than ever before. They have harvested this year 200,000,000 bushels more wheat than our own people can possibly consume in the year 1938. Furthermore, they have harvested at least 400,000,000 bushels more corn and 10,000,000 bales more cotton than can possibly be consumed in the United States in the next 12 months. Along with the surplus farm production has come a severe decline in farm prices. While that decline has brought pleasure to a few consumers, it has brought fear to many laborers, farmers, and businessmen. Laborers fear the loss of employment, because they remember the great farm abundance of 1932 and how that abundance turned out to be a waste because of the way in which it destroyed farm purchasing power and added to unemployment in the cities. In like manner, farmers are seriously disturbed when they see thousands of men thrown out of work by the steel mills and the automobile factories, because they know these men lacking the right to work will buy less farm products. They know that factory pay rolls and farm income go up and down together. Businessmen, seeing their volume shrink with lower farm income and farm prices, know this falling off in volume also means a shrinkage in profits.

I have before me a chart which shows year by year for over 20 years the extremely close relationship between the exchange value of farm prices and the profits of the great corporations. The figures prove beyond question that when labor and capital are working together effectively, agriculture also benefits and when farm production and prices are in balance with city production and prices, capital and labor share in the benefit. A balanced situation is good for all.

Farmers want to know why it is that capital is in hiding and unemployment is increasing. In a nation such as ours, courageous capital is absolutely vital to a satisfactory farm income and to the general welfare. Both farmers and laboring men want to know, therefore, why it is that capital has become so timid.

Farmers know that no matter how desperately they may strive with governmental help to adjust production to demand, they cannot create farm prosperity if business and labor conditions are bad. Only half the farm problem is on the land. The other half is in the towns and cities, and overseas where rival nations are trying to destroy each other and to avoid buying anything from outside their own borders. Therefore, I say the farm problem is also a labor problem, a business problem, and an international problem.

As we look into this overshadowing economic problem which affects all groups, we need to face certain background facts. First we need to realize the degree to which the world has changed since the Great War. The fright and cost of that war caused every nation in the world to strive desperately to import as little as possible and export as much as possible. For 15 years every nation has tried to develop economic independence so that in case another war should come it would not suffer as in the last one. The world-wide desire has in some ways affected the United States more than any other nation. The United States more than any other nation was changed suddenly by the war from a debtor to a creditor nation. Most of the other great exporting, raw-material nations were better able than the United States to maintain normal markets for their products, because their debtor positions made it easier for them to sell in world markets. Nevertheless, even these nations have found the post-war situation very trying. In one way or another, all of them have been affected by the methods employed by the great importing nations to cut down imports through the use of goods quotas, exchange quotas, increased tariff barriers, and positive embargoes. Furthermore, some nations have increased the international confusion by using unfair practices in world trade. Much as we hate to do so, we are forced to admit that a state of economic warfare exists, and therefore the old rules of the game do not work as they did 25 years ago. Secretary Hull's trade agreements are designed to bring economic peace, but it will take prolonged cooperative international effort before world-trade relations are even partially normal.

Fully as imporant as the international situation is the need for reckoning with the way in which new machines and new methods especially during the past 15 years have affected the varous regions and classes in such a widely differing way. The problem is to replace the old-fashioned automatic economic adjustments with modern adjustments which will permit the rapidly increasing output per worker, both on farms and in factories, to be matched by corresponding increases in the real income of those workers, with the least shock, confusion, or conflict.

But even more important than the effect of technology are the actions of highly organized groups equipped with great bargaining power which has been entrusted to them by the Government. Among these are corporations, labor unions, and farm organizations. These great groups all too often try to increase their profits, wages, or prices without regard for the general welfare; all too often they overplay their hand and bring about either shortage or an unbalanced abundance, which is equally destructive.

Actually, of course, there cannot be any lasting prosperity for corporations, labor unions, or farmers unless there is increased balanced abundance which can be moved into consumption at prices low enough to be fair to consumers and high enough to keep the increased balanced abundance coming. The contribution the farmer can make to a continuing balanced abundance at fair prices is the ever-normal granary. Can labor and business make a similar contribution which will restore prosperity and prevent

peaks of overproduction and valleys of underproduction? Business is not handicapped with heat, drought, and insect pests in the same way as agriculture. But business is faced with the problem of steel mills operating at 85 percent of capacity one year and only 35 percent another year. Labor is faced with the problem of great variations in employment. To what extent are the policies of business and labor responsible for the extraordinary swings up and down in production and employment in the cities? These problems are made by man and not by weather.

The three background factors I have been discussing—the change in our relations with foreign countries, the increased use of machinery and modern methods, and the growth of corporations, labor unions, and farm organizations—these three uncoordinated factors have an intimate relationship with the lack of business stability from which this country, along with the rest of the world, has suffered since the World War.

Men of good will should be able to counsel with each other to eliminate much of the severity of these man-made economic storms. This does not necessarily mean more government in business but it may mean that businessmen, laboring men, and farmers will counsel together to find out how to use government coordination at key points to increase our physical wealth and to eliminate the violence of those business ups and downs which have been acting so strangely since the Great War came to an end.

Doing this job of keeping business rising steadily should not be labeled with some terrifying name such as communism, fascism, collectivism, or totalitarianism. Doing this job simply means making democracy efficient.

Our various leaders, as they talk informally together, might well consider this problem of recovery as a problem of how best to build an efficient democracy in the kind of world which has grown up in the last 15 years. The essence of democracy is tolerance and belief in the sacredness of the individual. We abhor violence and bloodshed. But democracy, if it is to survive, cannot be anarchy. It must have a will of its own and it must be able to act. Otherwise, foreign nations which know exactly what they want may be able to project their conflicting ideas into a peaceful and decent democracy with tragic results. An inefficient democracy afflicted with many squabbling factions can easily play into the hands of those nations which stand for ideals that are very different from ours.

In nations which are young, with population growing and free land to be had, democracy may be mostly license. It may be license to exploit natural resources and to grab profits without regard to the welfare of others. But when a nation grows up, if democracy is not to become anarchy, then license must give way to law and order. To keep business traffic moving smoothly, businessmen, laboring men, and farmers, with the aid of government find they have to set up a system of red and green lights. Democracy does not mean crashing the light by any single group. Neither does democracy mean that one group of people can determine just where the lights are to be placed without regard to the rights of other groups and of all the groups.

Service of the general welfare by means of democracy depends on certain principles of decency and tolerance, which ought to be observed by both the majority and the minority in their public discussions. In this respect we have something to learn from the way in which the British have handled their exceedingly difficult problems since 1931. While differences between the groups are probably as great in England as anywhere else, they have maintained tolerance and free speech and all the essentials of democracy, while at the same time they seem to have been able to achieve an increasingly efficient coordination. Their businessmen, faced with taxes gerater than ours, have apparently gone to work on behalf of the general welfare. Their labor, after the disastrous general strike of 11 years ago, has thought increasingly in terms of the general welfare. Labor, industry, and government together have beeen concerned with the position of agriculture in England. They have assented to a much more extensive government activity on behalf of agriculture than anything our own Government has done. Because the British situation in some respects is more difficult than our own, these various groups are being led to think about the problem of coordinated policy in the interest of all. The British Government, for example, recently instructed a committee to examine the iron and steel industry to find how it might be coordinated best to serve the general welfare. In making its report the committee, among other things, advocated that the Government should set up a body which might pronounce a judgment on issues of public interest, "so that there may be a full and fair trial of the possibility of combining individual responsibility and initiative with coordinated and cooperative action and full recognition of the overriding importance of the national interests."

We here in the United States can, if we will, demonstrate our ability to bring about a coordinated drive against the business recession which began in the late summer and is now afflicting businessmen, laboring men, and farmers equally.

Farmers, laboring men, and small-business men, are awake today in the United States in a way they have never been before. They desire a world of greater security and abundance. President Roosevelt knows the thoughts and feelings of these people. He also has a friendly understanding of the problems of the larger-business men. He sees clearly a fact which perhaps some of them have missed—that business confidence and business prosperity cannot be built on any other foundation than abundance and security for the rank and file of the people. He sees clearly, too, that to build this basis for confidence, the Nation needs the cooperation of business and professional men as well as of laboring men and of farmers.

We cannot stop the recession if each group attacks the prices and returns of the others. If farmers block the efforts of labor to maintain fair wages, they themselves will be the losers when the workers have less money to spend for farm products. If workers carry on strikes against fair prices for food, then they will be the losers when farmers have less money to spend for industrial products. If business is to strive above all to pay smaller taxes and to keep wages and farm prices down, then business will lose the market for the things it has to sell. No; we found out in 1932 that recovery does not lie along that road. Let us not take that road today. There are practical ways to end this present recession.

While some businessmen may not agree, I believe it is vital for Congress at an early date to pass legislation protecting the prices and incomes of farmers and the pay envelopes and working conditions of labor. A practical ever-normal-granary act for agriculture will not only guard consumers against the extreme hazards of shortage resulting from droughts and pests, but it will give the small businessmen of the Middle West and South confidence in the stability of income of farmers. In like manner a well-drawn wage and hour law will be a defense against a continued downward business spiral.

But, in addition to these measures, others are essential. Farmers and laboring men must realize the vital importance of capital to the general welfare. Today we are witnessing a refusal of capital to invest similar to that of several years ago. It may be that hazards to investment, real and imaginary, are so great that capital either will not or cannot come out of hiding and take the risks inherent in all investment. But if our system is to endure, business must take the Government's word that Government wishes it well and business must assume those responsibilities of leadership which business claims. Otherwise Government will be forced to step into the breach.

As far as taxation is concerned Congress is considering what changes need to be made. I believe that the basic thought behind the undistributed profits tax is sound and that large industrial corporations should not be permitted to be turned into investment trusts merely to enable their owners to escape just taxation. However, small corporations in debt and the large corporations desiring to expand might be given more latitude and it might even be well if the large corporations could spend part of their incomes on plant expansion without being unduly cramped by heavy taxation on money used in such expansion. It is important for businessmen, farmers, and laboring men to realize that change in the taxation structure this year and Budget-balancing activities this year may not by themselves cure the present business recession. In fact, whenever Government spending is cut suddenly at a time when private business is not expanding, there is danger of a downward spiral for business. The same result can come whenever private credit and spending are suddenly cut off without provision for Government credit and spending to take its place. Today, when private capital is so timid, plans to encourage it to go to work again will be well worth while. It is a good thing for Government spending to be tapered off when business is on the upgrade, and for Government to shift onto private capital the burden of doing all those things which private capital can do better than Government. In the meantime, for the sake of us all, Government money may have to carry the precious human burden which private capital at the moment cannot or will not carry.

The President last week in his message to Congress on housing dealt with one of the most important single items having to do with recovery. We need at least 500,000 new houses a year. During the last 5 years we have produced an average of only about a hundred and fifty thousand. In the first 4 months of this year we produced houses at a lively rate, but then building costs shot up so fast that it became apparent that the ultimate consumer of houses would have to pay too high a percentage of his income for rent or payments on his home. Here in the building of houses is a splendid opportunity for labor and capital, cooperating, to serve the consumer in a way that will give the consumer the utmost satisfaction while at the same time labor is given steady employment and capital obtains reasonable profits. To do this requires planning and coordination of exactly the sort that is a challenge to modern efficient democracy. In my opinion, the President's housing message to Congress last week was a stirring challenge to the courage and intelligence of the American people. If we start building houses in a sensible way year after year, an enormous volume of freight will be created for the railroads. The public utilities will be stimulated. The steel mills will be producing fully twice their present output. The farmers will have good customers in the cities, and the automobile factories will have a market for production fully equal to that of last year. It is important, of course, in housing as in everything else to observe the fundamental principles of balance and coordination so as to avoid the danger of several years of overproduction of houses followed by several years of dull times.

There is no lack of private funds to finance the building of houses. The banks are strong and full of money, and the Federal Reserve System is in position to see that there is a superabundance of cheap credit insofar as that will help. Yes; we have the power to pull out of this present recession with great speed, but the Government cannot do the job by itself. Labor, agriculture, and industry must all think more definitely about functioning in a coordinated way. Each of the three groups may have to give up some of its pet ideas and substitute for them ideas which make possible cooperation and the service of the

general welfare. If this is done, the industrial production of the United States within 3 years can be at least 40 percent greater than it is today. Such a volume of production is a moderate goal that should not be outside the realm of practical attainment. If by taking thought, we can maintain a volume of industrial production this great, year after year, the result will be greater profits for capital, greater real wages for labor, and a greater purchasing power for farm products. The National Budget can be balanced and the public debt reduced.

In brief, there are certain practical policies and measures that are called for and with which thoughtful businessmen, laborers, and farmers can agree. These are:

First. Revival of housing as outlined by the President.

Second. Revision of taxation policy to cure injustice but to maintain revenue.

Third. Maintenance of farm purchasing power and protection of the consumer by enacting a workable form of the ever-normal granary into law.

Fourth. Maintenance of the purchasing power of labor and, therefore, protection of markets for farm and industrial products by a sensible labor program.

Fifth. Assurance of an abundant supply of cheap credit and capital through a healthy securities market, to encourage increased output and employment.

Sixth. Provision of Government capital in case of need to carry the burden until such time as the use of private capital takes its place.

Seventh. Continuance of our careful, thoughtful approach to the revival of world peace and world trade by means of Secretary Hull's trade-agreement program.

Through steps such as these seven, agriculture, labor, business, and government may cooperate in a common-sense way to resume the recovery march.

Reserve Officers' Annual Dinner

EXTENSION OF REMARKS

OF

HON. SHERMAN MINTON

OF INDIANA

IN THE SENATE OF THE UNITED STATES

Thursday, December 9 (legislative day of Tuesday, November 16), 1937

ADDRESS BY HON. LOUIS JOHNSON BEFORE THE INDIANA DEPARTMENT OF THE RESERVE OFFICERS' ASSOCIATION, INDIANAPOLIS, IND., DECEMBER 4, 1937

Mr. MINTON. Mr. President, I ask unanimous consent to have inserted in the Appendix of the RECORD an address delivered by Hon. Louis Johnson, Assistant Secretary of War, at the annual dinner of the Indiana Department of the Reserve Officers' Association, held at Indianapolis, Ind., on December 4, 1937.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

Fellow Reserve officers, it is fitting that my first remarks as a member of the War Department to a group of Reserve officers should be made here in Indianapolis. It was here, 20 years ago, at Fort Benjamin Harrison, that I received my first training for my duties and responsibilities as a Reserve officer. Here I got my first commission. From here, as a captain of infantry in the Officers' Reserve Corps of the Army of the United States, I left to command my first company.

I am very happy to see among you tonight many old friends who, during those trying training-camp days in the fall of 1917, shared my difficulties, my struggles, my hopes, and my aspirations, and I rejoice that so many of you have continued your interest and your activity in the Reserve.

In the intervening years we have gone a long way. On April 6, 1917, the Reserve Corps consisted of less than 3,000 officers, scattered throughout the country, with no sense of solidarity, with little or no training, and without the experience for the job that a major war demands. Today we are almost 100,000 strong, with a fine esprit de corps, with a community of interests and responsibilities, and with an influence in public affairs far beyond our numbers. We foster a definite and constructive program of national defense. We are acquiring the training and the experience that should enable us in case of emergency to take our place in line.

We are the minutemen of today. To us the Army offers neither a career, an avocation, nor a hobby, but simply an opportunity to perform a sacred patriotic duty. To qualify for membership in the Officers' Reserve Corps and remain eligible for active duty requires work, perseverance, and application. These we freely give at the cost of time and of money. We are in the Reserve neither for riches nor for gain. The pay for the 2 weeks' active-duty training to which most of us aspire hardly takes care of the cost of our uniforms and of our equipment. We enjoy our field exercises, take pride in our achievements in the classroom and in correspondence courses, and derive great pleasure out of our happy associations with each other on this and other social occasions.

Primarily, however, we have been attracted to the Officers' Reserve Corps because we realize that the wars of today are not won by professional soldiers, but by civilians who are called from their plows, their spindles, and their desks to defend their country, and we consider it our duty as citizens to be prepared for any contingency. We, who have been more fortunate in our opportunities and in our education, and have the training and the intelligence to appreciate the privileges of American life, are happy to add to our responsibility as useful citizens the duty of service in time of war.

That our peacetime training has justified itself, events of the last 4 or 5 years offer convincing proof. Since 1933, approximately 30,000 Reserve officers have been called upon to administer the camps of the Civilian Conservation Corps, and, with very few exceptions, they have performed their duties in a most commendable manner. Nothing, perhaps, so clearly demonstrates their efficiency, their capability, and their character as the fact that only 12 officers among the 30,000 called in the last 5 years have been tried by general court martial. I doubt whether such a record for discipline, honor, and efficiency can be matched in any corps, regular or Reserve, of any country in any period of its history.

More than a year ago another call was made upon us. Congress appropriated funds for the training of 1,000 young Reserve officers under the Thomason Act. We furnished the quota and again we proved that the Reserve includes a reservoir of young men of character, education, and training. At the end of the year there was room, under the provisions of the Thomason Act, for but 50 of them in the permanent establishment, but many times that number demonstrated their fitness. The Regular Army officers and enlisted men who served beside them gave them unstinted praise for their energy, their willingness, their discipline, their leadership, and their gentlemanly qualities.

During the last two summers Reserve officers were called upon to take part in field maneuvers, and the umpires appeared unanimous in their opinion that the Reserve system had justified itself. Regular Army officers, experienced in war and trained in peace, frankly were astounded at the way Reserve officers took over and performed their assigned duties.

You and I may well be proud of the Officers' Reserve Corps. The tree that was planted in 1920, providing for a civilian component of Reserve officers, is bearing fruit.

There is still much to be done, however, and I trust that Congress, now awake to the needs of national defense and to the importance of the Officers' Reserve Corps, will go a long way toward helping us realize the program that we in the War Department have set up.

Next summer we want to give 14 days' training to 30,000 Reserve officers. Last year but 25,000 were able, by the limited appropriations, to take advantage of such an opportunity.

We want to send 300 Reserve officers for more extended courses to our service schools to enable them to keep abreast of the growing developments in the art and science of war and of military organization. Upon their return to their home communities, these men should prove of inestimable value in the training and education of their fellow Reserve officers whose business or profession makes it impossible for them to take such extended courses of study away from home.

We want to bring into active duty 650 Air Corps Reserve officers to augment our splendid corps of regular fliers.

We want to increase R. O. T. C. facilities in our colleges and universities so that we may be able to count upon an annual increment of capable second lieutenants for the Officers' Reserve Corps. We have set as our goal a corps of 120,000 trained Reserve officers, and you and I must strive to achieve the desired objective.

Those of us whose Reserve activities date back more than 20 years, are not growing any younger. The duty and the responsibility for the growth, strength, and development of the Officers' Reserve Corps must soon pass to younger hands. We must look to the coming generations of college men with R. O. T. C. training to build a permanent structure of national defense upon the democratic foundations which we of the World War have laid.

Of those of us who served as officers during the World War, time is taking its toll. The ranks of the former enlisted men also grow thinner. I admit I was pleasantly surprised when I saw wave upon wave of World War veterans march by the reviewing stand at the American Legion Convention in New York, still erect in carriage, still lithe in body, and still firm in step. Not yet are we to be counted out, but we must be practical enough to realize that a year from now, 2 years from now, and certainly 10 years from now, the parade of marching veterans will present a far less encouraging sight.

Our reserve program must provide, therefore, not only for the procurement of officers but also of enlisted men. In an emergency, trained soldiers of previous military service are indispensable for key positions in the ranks. Every year, thousands of experienced Regular Army privates and noncommissioned officers are returning to civil life. We should encourage these men to retain their interest in the military service and we should find a place for them in an organized reserve. At present, we have enrolled 3,000 of them in the enlisted Reserve. We need a body of 150,000 of them.

So far, I have talked to you principally in terms of personnel. The raising, organizing, and training of manpower are the first requisites of an effective army. There are other considerations,

however, of equal importance. Without arms, without clothing, and without equipment, men are of little or of no military value.

The World War and the experiences of the last 20 years have proved conclusively that manpower can be raised and trained much more rapidly than it can be equipped.

The present War Department mobilization plan recognizes this fact and proposes to have mobilization keep pace with equipment. It provides initially for only a small protective force of about 300,000 which will be augmented gradually until it reaches 1,000,000 men at the end of 3 months.

Obviously, the small initial protective force must be fully equipped with the most modern weapons. Ample supplies of the munitions of war must be available to maintain it.

With the beginning of parade-ground drills and field maneuvers, to say nothing of actual combat, shoes wear out, buttons fall off, tools break, and other incidents of fair wear and tear of the service occur.

Due to careful planning, we have enough of the ordinary supplies to take care of our soldiers for a period of 6 months. The same cannot be said, however, of weapons and equipment developed since the World War, such as airplanes, antiaircraft and long-range guns, gas masks, and other more modern and essential accouterments of an efficient military machine.

We know that very little can be expected from industry in the production of noncommercial military articles during the early months of an emergency. Stocks of the critical items, which, due to their technical and noncommercial nature, cannot be produced by industry in the time and the quantity to meet these early needs, must be procured in advance during peacetime. The existence of such war reserves at the outbreak of hostilities may mean the difference between success and failure.

Our efforts must be directed to build up in time of peace a war reserve of raw and fabricated war materials sufficient to take care of our Army in all its needs until industry, mobilized for war purposes, can convert plowshares into swords and pruning hooks into spears.

To equip and supply our first defense troops with first-class modern munitions we would have to spend several hundreds of millions of dollars. The amount is staggering, and only in a grave emergency would the American people acquiesce in appropriations of such great magnitude.

We must take a sensible attitude toward appropriations for national defense. The needs of the Army and Navy must fit into a well-rounded National Budget, which takes into consideration all of the activities of the United States Government. Within the War Department itself neither the Regular Army nor the National Guard nor the Organized Reserves can satisfy its needs fully without jeopardizing the program of the other components.

In our enthusiasm for the element nearest our own hearts we must not lose sight of the fact that it is the national defense team that commands our loyalty and our fullest support. I assure you that the program of the War Department has considered all of its three components. Our Budget takes into account the needs and the interests of each element and strives to develop a well-balanced team of national defense. I urge you to familiarize yourself with the War Department program and to give it your full sympathy and undivided support.

I have referred to our components of national defense as members of a well-balanced team. I hope and pray, however, that this team will never be called upon to schedule any games nor to meet an opponent on the field of battle. We in the War Department of 1937 still adhere to the program of preparedness that the Father of his Country laid down in 1783. We still strive to administer our duties in the spirit of the peace establishment that he had intended.

Redealing the New Deal

EXTENSION OF REMARKS

OF

HON. SHERMAN MINTON

OF INDIANA

IN THE SENATE OF THE UNITED STATES

Thursday, December 9 (legislative day of Tuesday, November 16), 1937

EDITORIAL FROM THE WASHINGTON TIMES, DECEMBER 8, 1937

Mr. MINTON. Mr. President, I ask unanimous consent to have inserted in the Appendix of the RECORD an editorial which appeared in the Washington Times of December 8, entitled "Redealing the New Deal."

There being no objection, the editorial was ordered to be printed in the RECORD, as follows:

[From the Washington Times, December 8, 1937]

REDEALING THE NEW DEAL

Our ears detect, without strain, a new note in the written and spoken utterances of various "old deal" commentators on the New Deal.

The new note is to this effect: That President Roosevelt has now seen the error of his ways; that he is beating a disguised retreat to the extreme right while trying to kid his liberal and radical supporters into believing he is still a little left of center; that it won't be long now until the New Deal is just a memory and the Nation shall have returned to rugged individualism.

These old deal commentators' only adverse criticism of this supposed new tack of the President's is that he isn't going fast enough to the extreme right. Hence they are volunteering all kinds of advice as to how he could and should speed the retreat.

Read and tune in on this advice as much as we may, we can't get any specific ideas out of it. It is all put in general terms. Would we be too fresh if we should inquire just what features of the New Deal these old dealers want the President to persuade Congress to repeal?

Should this wittily christened—

"RETREAT FROM MOSCOW"—REPEAL THE C. C. C.?

include repeal of the C. C. C.? C. C. C. stands for Civilian Conservation Corps, and it has proved itself one of the finest single undertakings in our Government's history.

Approximately 2,000,000 young men have passed through the C. C. C. since its inception in 1933. Of these young men, most have been saved from hobo jungles or prep schools of crime or the manifold other corrosions of joblessness, all have been given a spell of excellent outdoor living and solid food, and many have left the C. C. C. for good civilian jobs. Incidentally they have paid their board and keep by starting in this country a real system of coordinated soil and forest conservation and flood prevention.

Would the old dealers want the C. C. C. repealed?

HOW ABOUT S. E. C., F. D. I. C.?

How about the S. E. C. (Securities and Exchange Commission) and the F. D. I. C. (supervising Federal bank-deposit insurance)? These are two New Deal measures. Between them they have kept the 1937 slump up to now from degenerating into a far-flung bank-failure and market-crash slump, as well as a business taper-off.

There are old dealers who admit that the S. E. C. is a good idea, and well carried out in the main, and plenty of these old dealers harbor in Wall Street. Would even the other old dealers want the S. E. C. abolished and Federal bank-deposit insurance abandoned?

REPEAL THE WAGNER ACT?

The Wagner Labor Relations Act is a New Deal measure to give labor a better show than it has had in deciding what it will work for and under what conditions. This law is faulty as now written, and should be revised, we think, so as to take some starch out of some rugged and ambitious labor leaders as well as out of some capitalists. But would the old dealers repeal it—at the risk of killing the chance that the present war between the A. F. of L. and the C. I. O. may some day be settled through the mechanisms of the Wagner Act?

REPEAL P. W. A., W. P. A., S. S. A.?

How about other New Deal items; relief, for instance, as administered by the P. W. A. and W. P. A.? We have these millions of unemployed, whom industry thus far hasn't absorbed. Are we simply to leave them to their fate by abolishing P. W. A. and W. P. A. on grounds of wastefulness and excessive cost? Or would it not be better for all of us to hammer on the sound proposition that relief should be administered as economically as possible while remaining adequate?

And how about Social Security? The Social Security Act aims to pension off aged workers and partially compensate workers thrown out of jobs by economic forces—two ways of cutting down relief expenditures. Most enlightened nations have been doing such things for years. Are the old dealers asking that the will be improved as experience indicates it should be—and we wish Congress would start borrowing against S. S. A. taxes now being levied, so as to include people now 65 or over and now in need of old-age pensions.

Just what do the old dealers want the New Deal to stop doing anyway? The most concrete suggestion yet made is to repeal some of the high-bracket taxes on rich men and corporations and substitute a general sales tax.

Agricultural Relief

EXTENSION OF REMARKS

OF

HON. ROBERT R. REYNOLDS

OF NORTH CAROLINA

IN THE SENATE OF THE UNITED STATES

Thursday, December 9 (legislative day of Tuesday, November 16), 1937

ADDRESS BY HON. ROBERT R. REYNOLDS, OF NORTH CAROLINA, SEPTEMBER 6, 1937

Mr. REYNOLDS. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD an ad-

dress on the subject of agricultural relief, delivered by me before the North Carolina Farm Bureau Federation at Raleigh, N. C., on September 8, 1937.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

Mr. Chairman, members of the North Carolina Farm Bureau Federation, and guests, I am deeply grateful for the opportunity to be here with you today. For a long time I have wanted to come home and discuss with you some of the many problems confronting agriculture. I need not tell you of my great interest in those problems. I need not say to you that I have consistently given my wholehearted support to every legislative proposal and every Federal program designed for the betterment of conditions for the farmer. These things you know.

In fact, the usual preliminaries of an address are not necessary. The status of agriculture cannot be improved nor can any of your problems be solved by speech making. You who have seen your crops destroyed by rain and drought, you who are forced to battle pests and insects, crop shortages and surpluses, not to mention Government red tape, have little time for preliminaries.

When the invitation was extended for me to be here with you, it was evidently felt that as a Member of the United States Senate—a position you helped to give me because you believed that I would measure up to the trust you imposed—I might bring you a timely message. It is my hope that you will not be disappointed. It is my desire to bring you a message of hope and a message of encouragement.

I wish that I might tell you that all is well on the farm. But you know different. I wish that I might say to you that a full solution of the farm problem is on the way. But again you would know different. Yet I can tell you in all sincerity that there is a keen desire on the part of the members of your national legislature to do everything that is humanly possible to improve the economic condition of rural America; that farm legislation will be given the right-of-way when Congress again convenes, and that we hope to draft a legislative program and write new laws that will bring maximum benefits to those who till the soil. We have already done enough for the theorists and the office-building farmers.

At the outset, let me say candidly that I am primarily concerned with the welfare of agriculture in North Carolina, but I realize full well that to help you there must be a broad national program, designed to raise the general level of the farmer. Congress can act only for the common good.

With your permission, and as I must necessarily in the time allotted to me discuss agriculture from a national viewpoint and in broad terms, I shall build my message around four main points. I hope to mention a few of the factors leading up to the present farm emergency. I would like to review some of the more recent gains in the direction of meeting this emergency. I shall deal briefly with legislative developments and with what is proposed in the way of new assistance to the farmer. I shall not use the word relief—it is not that—it is assistance from your Government to which you are richly entitled. In addition, I would also like to cite a few of the more significant trends that hold out new hope for our agrarian population.

First, however, let me say that your presence here indicates your faith in your State and National organization, which have done much to improve your economic welfare and represent accurately the needs on the farm. It has been my privilege to work with your State and National leaders. I have full confidence in them. I seek and I accept their counsel and advice on all matters pertaining to agriculture. I do so because I know that they represent you and your welfare.

Several days ago, it was my pleasure to look over a summary of the activities of your national organization—the American Farm Bureau Federation. While the accomplishments do not represent all that we want for the farmer, they show much progress in that direction. And even these gains would not have been possible if the farmers were not organized and represented by able spokesmen here in Raleigh and in Washington.

In leading up to present conditions let me look into the past for a moment. During the last hundred years the productivity of the average farm worker has been stepped up greatly and there is every reason to believe that this trend will continue. This has brought the need for many adjustments and with them social and economic changes. Improved machinery has not been entirely responsible for increased production. It has also come from improvement of plants and livestock; greater ability to meet the challenge of insects, pests, and disease; better knowledge of soils; more efficient farm management, and superior marketing technique.

From the days of the crude plow and hand tools, with cotton and corn planted by dropping seeds to be covered with a hoe as the home gardener operates today, through the eras of great mechanical inventions and plant improvements, farming has emerged to its present status. The farmer is no longer isolated. The automobile, the radio, the telephone, and newspapers have brought our rural population closer to centers of population, education, and entertainment. More farms have been electrified and more are being electrified as the Rural Electrification Administration proceeds with its fine program and as your power companies make it easier to secure electrical current on the farm. This latter development, has, in turn, brought to the farm new labor-saving devices, and a new degree of convenience and efficiency.

In fact, some economists contend that perhaps too much emphasis has been placed on production efficiency by farmers generally; that the gains have been passed along too rapidly due to intense competition, resulting in overcapitalization of land and limiting of the ability of the farmer to secure those things making for better living standards.

Supporting this contention, they point out that in 1787, the year the Constitution was drafted, surplus food produced by 19 farmers went to feed 1 city person. In recent years 19 people on farms have produced enough food for 56 nonfarm people, plus 10 living abroad. Here, indeed, is a striking example of the increased productivity of agriculture. During the twenties there was a great increase in farm efficiency, in terms of production. From 1922 to 1926 production increased 27 percent, with little change in crop acreage and a decrease in the number of agricultural workers.

Between 1930 and 1935 production on the farms declined more than 10 percent, due in part to unfavorable weather. Meanwhile, because of widespread unemployment in urban centers, around 2,000,000 more people were on farms than 5 years before, and perhaps an equal number remained on farms instead of migrating to cities where jobs were scarce. This, of course, served to reduce the per capita productivity in agriculture.

Another factor in increasing farm production since 1920 was increased mechanical power, releasing land formerly required for grazing. It is estimated that between 1918 and 1932 about 9,000,000 horses and mules were lost to the farms, releasing many millions of acres of crop and pasture lands for the production of saleable commodities.

In plain, everyday language, all this means that when the depression came productivity on the farms of the country was way beyond the ability of our people generally to buy and consume. To make matters worse, foreign markets were closed. As a result, great surpluses—the nightmare of things produced for which there was no demand at reasonable prices, the sickening spectacle of reduced, if not entirely wiped out, farm income—faced the farmers of the country. It was then that we saw the great parade of "Hoover buggies" on the highway of North Carolina, a procession I earnestly hope we shall never see again.

Farm prices over the country dropped. In 1932 the average price for tobacco was ten and a half cents a pound. Cotton brought only six and a half cents. Potatoes could be had at less than 40 cents per bushel. There were tottering prices for farm commodities and livestock all along the line.

In that eventful year, 1932, we witnessed a militant United States. An aroused and angered populace went to the polling places in greater numbers than ever before and swept the Hoover administration from office. Mr. Hoover, the man who once declared that it is not the business of the Government to help the farmer. To replace Mr. Hoover, who went up in the air while farm prices and farm income went down, the people sent to the White House Franklin D. Roosevelt. He has not failed you, men and women in agriculture. You evidenced your agreement to that when you returned him to office in 1936. I need not say more of events leading up to the present.

Here let me digress a moment. Unfortunately, while we can do much to improve marketing conditions; while we can improve the quality of plants and livestock; while we can control pests and insects, production control is most difficult. As a witness before the Senate Agriculture Committee once said, the trouble with production control is that "God Almighty controls production and He won't sign up." For the man who can develop a workable and equitable plan for production control, there awaits fame and fortune. But the farmers of the country must be brought to realize that in unity and cooperation lies the success of any farm program, whatever it may be.

I mentioned the gains we have made. What happened during the first term of the Roosevelt administration? I will give you facts. Farm cash income went upward 85 percent. Farm prices went up 75 percent. Forced sales of farms were cut in half. Farm real estate values climbed 16 percent. Here, in brief, is the story of agricultural progress made under the leadership of our beloved President from 1932 to 1936.

At the low point of $4,377,000,000 in 1932, cash income from farm production rose steadily until in 1936 it reached $8,100,000,000, including, of course, Government payments to the farmers. This total was 85 percent larger than in 1932, and about one-quarter short of the 1929 standard. Government payments accounted for around $400,000,000 or about 5 percent of the 1936 farm income.

In the first half of 1937 farm cash income, including Government payments and based on farm marketings, aggregated $3,833,000,000, or about 16 percent more than the corresponding figure for the first half of 1936. It is now estimated that the total 1937 cash income for agriculture will be in the vicinity of $9,000,000,000.

Cash incomes available for farm family living in 1936, after deductions for wages, operating expenses, taxes, and interest, increased even more rapidly during the 4-year span than did cash income as a whole. Cash income available for living from 1932 production was $1,473,000,000. From 1936 production it was $4,475,000,000. This was 204 percent above its 1932 depression low and within 8 percent of the 1929 level.

The tremendous gain in farm income during the 4 years was somewhat offset by an increase in prices of things farmers buy. Allowing for an increase of 16 percent in prices farmers pay for

commodities and services used in living and production, the purchasing power of cash income from farm production was still 60 percent greater in 1936 than in 1932.

I spoke of farm prices. What has been the trend generally? You know prices better than I. From an average price of ten and a half cents a pound in 1932, tobacco went upward to 27 cents on July 15, 1937. Cotton rose from six and a half cents a pound in the former year to 12.4 cents a pound on the latter date. There were corresponding gains in prices for all farm commodities and livestock.

It is my sincere opinion that the Democratic administration has done more for agriculture and for the farmers than any other administration in the history of the country, and done it under the most difficult circumstances we have ever faced. Not only has your Federal Government given emergency assistance, and is continuing to give it—the plan for the immediate pegging of cotton prices being a case in point—but it has strengthened the position of the Government to permanently aid the farmer. These benefits—better schools, better roads, better weather reports, better pest control, and better research into new uses for agricultural products—cannot, of course, be measured in terms of monetary value to the average farmer. It is always difficult to appreciate those things which benefit us only indirectly, but they do improve living standards in a way that cannot be reckoned in the family budget. They should be given proper appraisal in their relation to the general welfare of agriculture.

So much for mention of increased production leading up to the most acute stage of the farm emergency and the gains we have made in coming out of the hopelessness and despair of 1932. What can we do to safeguard our farmers against new emergencies and also preserve the gains we have made to date? I see no hands raised to offer the answer. But I can assure you that the Congress, with the help of your competent leadership, will do everything that is possible to find the proper answer.

As you are all aware, the collapse of the Agricultural Adjustment Act when the Supreme Court declared this law unconstitutional was a severe blow to agriculture. In its place, the Congress fashioned and drafted the present soil-conservation program. This measure, enacted into law early in 1936 and carrying an annual appropriation of $500,000,000 for the aid of farmers, has been extremely helpful. If we have gained nothing from it but a new appreciation on the part of rural America for care of the soil, and also a temporary easing of farm burdens, we will have more than fulfilled its objective.

It is the growing opinion in the Congress that agriculture cannot be raised to its proper level with one piece of legislation, however broad and important that piece of legislation may be. We must go further. The farmer should have adequate tariff protection to the end that he will not sell in an unprotected market and buy in a protected market. He must be given more equitable marketing facilities. His interest must be looked after in all legislation, whether it is drawn to directly affect industry or some other phase of our national life. Fortunately, members of Congress from metropolitan areas are rapidly coming around to agree that upon the status of agriculture is the basis of our whole national well-being. It was true a hundred years ago and it is true now.

Sometime ago I saw in a CONGRESSIONAL RECORD of a few decades ago what is said to be the only cartoons ever inserted in the daily chronicle of Congressional happenings. It was inserted in some way by the late Senator Tillman, of South Carolina, and it bore the title of "Tillman's Analogical Cow." In one cartoon, a large cow with its head in the West, was being fed agricultural products and Wall Street was successfully milking the cow. The other cartoon reversed the cow, and depicted an effort to feed it stocks and bonds, and the farmers in the West holding the milk bucket were getting no milk. To me those two cartoons carry a moral. It is that the prosperity of agriculture is the fundamental basis of the welfare of all our people—that the farm is the keystone in our national economic arch. Obviously, it will require time to secure more widespread appreciation of that fact. But it is much nearer than it has been and that in itself offers some hope for agriculture.

Unfortunately, almost every legislative proposal advanced for assistance to agriculture is based on some form of compulsory production control—and drastic compulsion is not the American way. Yet, something must be done to guard against unreasonable and heavy surpluses. So if some form of compulsion is found to be in the best interest of the farmer, it must be of a painless variety and of a character that the farmers themselves will agree to by a majority decision of those involved. Such an idea is incorporated in proposed legislation. I need not tell you that farm legislation was a highly controversial issue during the session of Congress just ended. Bills were introduced and hearings were held in both Houses. It was planned by leaders to put through the Agricultural Adjustment Act of 1937, introduced by my able colleague, Senator POPE, of Idaho.

However, as it was near the end of the session before this legislation was drafted and the general opinion prevailed that a measure of such importance should not be rushed through Congress, resolutions were passed authorizing the Senate and House Committees on Agriculture to study the problem and have legislation ready for the next session. Steps were also taken to see that the farm bill is given the legislative right-of-way, whether at a special session or the regular session in January. Meanwhile, the Senate committee will hold a series of regional hearings in an effort to obtain the views of farmers with regard to new legislation.

Until a bill is drafted and submitted to Congress, it would be difficult to present accurately any outline of what it will contain. But it now seems apparent that there will be a general farm program which will include: A provision for control of surpluses above granary or carry-over needs, for example, a safe ratio to domestic consumption, plus a salable export supply, plus a reasonable carry-over against the possibility of dearth incident to bad crop year; insurance against crop losses from droughts and other natural causes; continuance of the present soil-conservation program; price-pegging loans; research laboratories to find new uses for farm products; and perhaps a readjustment of freight rates on farm commodities.

At the risk of injecting an unfavorable note into my message I will tell you frankly that enactment of a new farm program will require your patience and your courage. You must be united under the leadership you choose. Only through well-organized and intelligent action can opposition be overcome. The cry of centralization and regimentation will come from many sources. But we know that in the final analysis it is only right and just for the Federal Government to step in where the State cannot do the job. I say that with no weakening of my strong belief in States' rights. But, as I have said many times before, we have become a Nation of interstate commerce. The earnings and the buying power of factory workers in New York and Michigan have a very definite effect on the price the farmers in North and South Carolina will get for their commodities. We need a new conception of interstate commerce. Our economic march cannot move ahead unless we face facts and not theories.

I would be the first to bitterly oppose to my last ounce of human energy any proposal to inflict compulsory legislation on the farmers of America when they did not want it. Likewise, I would be the first to support any sound proposal that is based on the needs of the farmer, written for the farmer, favored by the farmer, and for the best interests of agriculture. In that viewpoint I believe I reflect the attitude of a great cross-section of the National Legislature. It does not behoove giant trusts and corporations which have waxed rich from Government protection in the form of tariffs and liberalized trade restrictions to say that assistance of beneficial character to the farmer is not the American system.

Speaking of "regimentation and centralization", the familiar cry of all who oppose constructive legislation to help the masses, 2 years ago the Congress authorized the Federal Trade Commission to make an inquiry into agricultural income with particular regard for monopoly in the handling of farm products. An important report in connection with that investigation was submitted to Congress early this year.

Let me read to you a paragraph from that report: "In the study of the situation of the handlers, manufacturers, and processors of agricultural products the Commission has observed the existence in various industries of a high degree of monopolistic control which in some cases has been derived, in part at least, by methods contrary to the letter or spirit of the law. In some cases, no doubt, ineffective enforcement has been in part responsible. In other cases the law itself appears to require amendment." The Commission made specific recommendations with regard to the amendment of the Clayton Antitrust Act. Here is a need for improving the methods whereby the farmer markets his crops.

Earlier I expressed the thought that what is needed is not one piece of farm legislation but a general program. On that point the Federal Trade Commission reports: "The depression of agriculture has been a major economic problem ever since the war. The restoration of farming to a reasonable degree of prosperity, which will permit farmers to share in the growing wealth and income of the country, must be the result of different types of action directed at different parts of the program."

Some progress has been made through cooperative associations organized and directed by civic-spirited and patriotic men. It is gratifying to hear on many sides that as a general rule the true cooperative associations have been of great value to the producers of farm products by increasing the bargaining strength of producers and reducing the spread between producers' and consumers' prices. Every precaution must be used to see that cooperative associations are true cooperative associations and dedicated to the best interest of the farmer. I am confident that the North Carolina Farm Bureau Federation is representing the farmer adequately in that respect.

It has been aptly stated that the mechanization of the farm has tended to widen the gap in the general well-being between farmers who are in position to embrace these advantages and those who are unable to do so. The one-horse plow and the rake and hoe are not museum pieces. But the man with these cannot be expected to be the competitive equal of the farmer with a tractor and other mechanical inventions. Too rapid growth of the latter type farm operation will tend to center commercial production on fewer farms. In turn, this would swell the ranks of farmers removed from the commercial production of farm commodities. Unless opportunities are available for employment in cities through greatly increased industrial production, we will have an even more serious farm problem.

Some legislatures have already considered proposals to curb the growth of "corporation farms" and a program for assisting tenants and sharecroppers to buy land has been approved by Congress. Loans are to be made on a 3-percent amortization basis, but appropriations made by Congress are inadequate. However, it is anticipated that adequate funds in the future will make this measure an important one—giving a new lease on life for our many tenant farmers and sharecroppers.

New hope for agriculture may be offered through a broad program of research to find new uses for agricultural products. President Roosevelt has already indicated that he looks with favor on the establishment of a laboratory in the South, and the Government is now utilizing many existing agencies to do much to find new means of bringing income to the farmer. It is not beyond reasonable hope to believe that much of our idle land, some of it cultivated and removed from production, will one day be used to produce commodities for use in industry. In the past, Congress has too often failed to heed the demands of the farmer for protection against a flood of foreign oils and chemicals which could be produced from farm products. One reason for this has been that industry has been strong in opposing such proposals, due to the cheapness of the foreign product. Another is the hesitation to reopen tariff questions. But the strength of the farmer, through united and cooperative action with other farmers, is growing, and I hope will continue to grow.

In conclusion, let me express the hope that in my message to you I have brought a few random observations on the problem of agriculture which will at least convey to you my own interest, offer you some hope and encouragement, and strengthen your determination to work in harmony with the farm brotherhood for the raising of the general economic level of rural America.

It is recalled that nearly a hundred years ago a Member of the Senate warned the country that "Cotton is king!" I say that "Agriculture is king!" It was the farmers at Lexington who fired the shot heard around the world. It was the farmers at Kings Mountain who saved the day. Always it has been the farmer in the vanguard of building a real America. Do not lose faith. The radio has not replaced the porch of the village store as our country's great political forum. Modern inventions have changed the old farm and presented new conditions, but the undying and undefeated spirit of our rural population still lives and is winning more and more attention in Washington. With all the dark spots, the future for agriculture seems brighter than it has for many long years.

Industry's Outlook

EXTENSION OF REMARKS

OF

HON. JOHN G. TOWNSEND, JR.

OF DELAWARE

IN THE SENATE OF THE UNITED STATES

Thursday, December 9 (legislative day of Tuesday, November 16), 1937

ADDRESS BY LAMMOT DU PONT BEFORE THE NATIONAL ASSOCIATION OF MANUFACTURERS, DECEMBER 7, 1937

Mr. TOWNSEND. Mr. President, I ask unanimous consent to have printed in the RECORD an address entitled "Industry's Outlook," delivered on the 7th instant before the luncheon meeting of the National Association of Manufacturers at the Waldorf-Astoria Hotel, New York City, by Lammot du Pont, president of E. I. du Pont de Nemours & Co.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

Amid the confusion and controversy that mark the economic thinking of today we stand in remarkable agreement on one point. American opinion seems unanimous that the chief hope for a lasting solution of our major social difficulties lies in the vigorous expansion of industry into new fields.

All sides are looking to industry and to industrial science to create millions of new jobs and end unemployment for all who can and will work.

Granting that the purchasing power of a part of our population is too low, it is industry alone that can produce the additional national income necessary to a measurable improvement of this condition.

Some parts of our agriculture are disorganized. In the past technological progress originating in and made available by industry has been the recourse of the American farmer in similar emergencies, so that here, too, industry and science are being hailed as agriculture's greatest hope.

We have gone far in 50 years, either directly through industry or indirectly through the funds that industry and those who have profited by it have provided in taxes, in grants to educational enterprise, scientific research, and other agencies working for the common good. This tremendous advance, from which the vast majority of us have gained, has tended to make us more acutely aware of the problems still facing us and of those among us who have gained little. Poverty, unemployment, and disease are no longer accepted by us as unavoidable world-old hazards of man's existence on earth. As a people we recognize a responsibility for their progressive reduction and, if possible, their eventual removal, an end once thought to be unattainable.

Let us remember that industry inspired this viewpoint by virtue of solid accomplishment that has raised us, nationally, to a plane from which, for the first time in history, we can see over the walls of precedent.

In this, the world's most intensely industrialized Nation, poverty and want, real though they are, have become lesser problems than in any comparable community, regardless of its form of government, its political leadership, or its economic pattern. We have in the United States less than 7 percent of the world's population and less than 6 percent of the world's land, and yet the annual domestic business done by, between, and among Americans represent almost 40 percent of the world's trade.

So far as America is concerned, poverty has become a relative term in the past 50 years. In many lands what we call poverty would be called well-being, what we define as well-being would be called riches. The most formidable social problem of the present dwindle into a mere fraction of the whole when we regard the enormity of what was undertaken by industry on this continent and the distance we have come toward our goal. The wonder today is not that we have problems still to solve but that we have so few of them.

It is not surprising, therefore, in this industrial age, in this industrially built Nation, that the bulk of responsibility for future social betterment should be placed on industry's shoulders. It belongs there. And industry accepts that responsibility. Even more, we welcome this responsibility with full confidence in our own and our Nation's capacity to discharge it successfully. All that we ask is the same fair opportunity to work that we believe should be given to the humblest citizen.

The difficulties confronting us are not of recent origin. Their roots sink through all the levels of civilization to the very beginning. It follows that they cannot suddenly be removed. New jobs, new wealth, farm prosperity cannot be picked like dreams and theories out of the air. They can be produced only through planned research, planned development, and by planned expansion of plant, sales, administrative, and other facilities, which means at every step the planned expenditure of capital months and years in advance of one penny of return. And this must be intelligent planning.

In my own company certain projects only now coming to fruition had their genesis as far back as 8 or 10 years ago. A new type of motor truck tire, recently placed on the market, was under test for 3 years before the tire manufacturers were satisfied its production was warranted, and prior to that research chemists worked even longer on the basic development that made the tire possible. So-called new industries such as air conditioning, rayon, plastics, radio, were 20 or more years in developing their present momentum. These instances are typical.

All forward-looking industrial activity is planned. It is based on what the planners believe will be the needs and conditions of 1, 5, 10, or even 20 years hence. Before a new factory is built or an old one is enlarged, before a pound of raw materials is ordered or a dollar is appropriated for wages, advertising and other expenses, industry must know with some reasonable degree of certainty the conditions that will prevail once the wheels begin turning. Even the smallest retail merchant, who buys in February for delivery in November, faces this identical problem of trying to gage the future. He is bold or cautious according to the range and clarity of his vision. So is all business.

Obviously, then, when the future is uncertain, business is uncertain. It becomes like an automobile driver who, blinded by fog, feels his way over a strange road fearful of the ditch. The power and speed built into the car are useless. There is no fair opportunity to employ them except at the risk of a wreck. Consequently the sensible driver slows down or pulls off to the side until the fog lifts.

Today, industry is blanketed by just such a fog of uncertainty. Uncertainty rules the tax situation, the labor situation, the monetary situation, and practically every legal condition under which industry must operate. Are taxes to go higher, lower, or stay where they are? We don't know. Is labor to be union or nonunion; is the A. F. of L. or the C. I. O. to dominate it, and in any event what will be expected of the employer? It is impossible even to guess at the answers. Are we to have inflation or deflation, more government spending or less? Industry is without a scrap of knowledge on either subject. Are new restrictions to be placed on capital, new limits on profits? Industry doesn't know. The whole future is a gigantic question mark.

I say this in criticism of nobody. Perhaps the uncertainties of the recent past, which were, in part at least, the outgrowth of world conditions beyond any one nation's control, justify and excuse the uncertainties of the present. That is for history to decide. What has been done, wisely or unwisely, is behind us. Let us leave it there. It is no time for post mortems.

However, if industry is to be given the fair opportunity to work that it seeks, some definition should be given of what, to those of us in industry, would constitute a fair opportunity. My own thought may be summed up in a sentence: Give industry a reasonable degree of certainty upon which it can count in planning current and future operations. In short, lift the fog and let us see the road we must travel.

At this juncture, the stabilization of tax rates over a definite period, plus a simplification of the tax structure, may be almost more important than the actual level of taxes. Simplification of the tax structure would, indeed, amount to a tax reduction, because it would decrease the high and ever-rising cost the taxpayer must bear to determine what taxes he owes. The present fear

that we face a rapidly ascending tax scale, as well as new taxes, the nature of which nobody can guess, stands like a wall in the path of industrial expansion.

The labor situation should be stabilized. Strikes, broken contracts, wars within labor's own ranks, the constant threat of sweeping new laws have reduced industrial planning to the category of a gamble, so far as the labor factor is concerned. Employer, labor, and public alike are suffering in consequence. Unemployment is increasing. New plants that were planned have not been built. They dare not be built in face of the uncertainty. Here again is a situation wherein the stabilization of fair conditions over a definite period may be more important even than the details of wage rates and hours or the precise form of labor organization.

If industry is to have a fair opportunity to work, the legal rules under which it must operate should be stabilized immediately. As long as the law-making mills grind, the fog of uncertainty mocks the industrial planner. Business needs more than a mere breathing spell from legislative experimentation. It needs positive, reliable assurance that the complicated terms and conditions under which it must function are finally determined, subject only to an unmistakable public demand for their amendment. As it is, the businessman is the subject of more legislative concern than the criminal. The latter enjoys far less uncertainty of the laws prescribing his operations. The criminal laws are stabilized.

Few people realize the cost of putting one man to work. A recent study of more than 100 factories employing 112,000 men and women showed a computed average investment per employee in excess of $8,000, of which almost $3,000 represented working capital. On the basis of these figures, which undoubtedly are low for industry as a whole, the task of providing the facilities and working capital necessary to give jobs to the existing labor surplus in this country is one that preimposes an investment by private industry that would be no less than $25,000,000,000, and which might greatly exceed that sum. That is to say, it will take $25,000,000,000, or more, invested a year, 2 years, perhaps even 10 years in advance of any hope of return on it, to create 3,000,000 industrial jobs that do not now exist. If anything, this is an understatement of the problem.

Such an expansion of the present employing structure can only be achieved by the discovery, development, and popularization of new products, by vastly broadening the market for existing products through lowering their cost, and by maintaining a rule of fair return for all effort, not excepting capital effort.

The task is staggering in its size and complexity, even assuming a reasonably clear road and reasonably stabilized conditions. However, it is neither hopeless nor impossible.

Since 1900 more than 50,000,000 persons have been added to our population. The best estimates are that we will add less than two-fifths of that number in the next 30 or 40 years, after which the population will decline. The future problem of providing a job for every worker is, on its face, a much smaller one than was that of the three or four decades immediately behind us.

At the same time the facilities for creating jobs have been augmented. It is elemental to point out that science and invention are based necessarily on knowledge, and that knowledge is cumulative. We know vastly more today than we did in 1900. We have hundreds working to create new things where before we had tens. Discovery has become organized. The industrial research laboratory is, practically, a child of only yesterday just entering adulthood.

In recent years more than 10,000 new metal alloys and more than 250,000 new compounds of chemicals have been produced. Of these, only a handful as yet are in use or their possibilities realized. What they hold in the way of new materials for industry, new drugs for medicine, new products for new industries, and new jobs, is a guess beyond the most fertile imagination.

Once dependent wholly on natural materials, only man's own ingenuity is now the limiting factor in industry. From an industrial era of adaptation, we have entered a new era of creation. The next 10 years should outstrip the previous 20, the next 20 the previous 50, if the opportunity for accomplishment remains at all comparable. America's industry asks only that fair opportunity.

British Imperial War Council Report

EXTENSION OF REMARKS

OF

HON. HENRY CABOT LODGE, JR.

OF MASSACHUSETTS

IN THE SENATE OF THE UNITED STATES

Thursday, December 9 (legislative day of Tuesday, November 16), 1937

A DISPATCH WHICH WAS CARRIED BY THE INTERNATIONAL NEWS SERVICE ON NOVEMBER 14, 1937

Mr. LODGE. Mr. President, I ask unanimous consent to have inserted in the Appendix of the RECORD a dispatch which was carried by the International News Service on November 14, 1937, describing the secret report made to the British Imperial War Council in the spring of 1917.

There being no objection, the matter referred to was ordered to be printed in the RECORD, as follows:

WASHINGTON, November 14 (INS).—The verbatim official text of the secret report to Britain's Imperial War Council in the spring of 1917, revealing in detail the Allies' secret deals for territorial spoils long before the World War ended, is presented herewith exclusively by International News Service.

Obtained through the journalistic ingenuity of William K. Hutchinson, veteran International News Service correspondent in Washington, this amazing document discloses the American people entered the war shortly after that Imperal Council conference, not knowing they would, in effect, be obliged to fight for these secret spoils pledges.

The cast of characters participating in the historic conference herein publicly recorded for the first time, included, among others, the following:

Prime Minister David Lloyd George.
Foreign Secretary the late Arthur James Balfour.
Secretary of State for India the late Austen Chamberlain.
Canada's representative, Sir Robert Borden.
New Zealand's representative, W. F. Massey.

The official text of what transpired at the Imperial War Council conference with regard to the secret pledges of the Allies follows:

"The PRIME MINISTER. I will now ask Mr. Balfour to give his statement on foreign policy.

"Mr. BALFOUR. I do not think it is necessary, really, for me to say much about either of the two important foreign countries—America and Russia—at this moment, because about America some of the gentlemen here have more direct knowledge than is possessed by the Foreign Office. The Canadian representatives have a knowledge of America which we hardly possess, while as regards Russia we have already discussed the situation, and I think the Cabinet understands it as well as anybody can understand this rapidly moving cinematograph of Russian politics. The real thing that is important to us, I think, is to know whether, if, as we hope, the reasonable and moderate reformers win, they will be able successfully to administer the country. If you look back upon Russian history you will see that every great movement of reform has come when the administrative inefficiency of the autocracy has been followed by some great calamity. The Crimean War, which broke the heart of Nicholas I, was immediately followed by the greatest of all revolutions, the freeing of the serfs, and other great legal reforms of the early reign of Alexander II. The calamity of the Japanese War was followed by the establishment of the Duma, and the administrative disgraces of the present war are followed by the revolution which is now going on before our eyes. But we have to notice that while the general feeling of disgust and discontent with the inefficiency of the autocracy has always been able to produce these reforms we have never had the opportunity of seeing whether the democracy will be able to do what the autocracy utterly failed to do, which is to administer this enormous country and to organize it for purposes either of war or peace. The total failure of the autocracy is amazing if you look back, and my fear is whether these new people will do so much better than the old. In Russia there is no middle class. Corruption has eaten deeply into their vitals and we must not hope for too much. It seems certain, however, that they cannot do worse than their predecessors. I think that is quite clear.

"The Central Powers, as we all know, have an enormous military advantage over us in their central position. They have a corresponding advantage from the point of view of their aims. Germany dominates the aims of the whole of the coalition against us, but none of the other powers have aims which are inconsistent or even divergent from those of Germany. Austria, for example, has, or had, in the earlier days of the war, nothing except to gain by German successes. Germany's desire to press on in the east was not only good for Germany but for Austria. Turkey, of course, was promised hegemony in the further east, which certainly, when it came to the point, Germany would never have allowed her to exercise. But Turkey felt that her objects were identical with Germany, so there has been not only a central direction but a central motive. Now, we and our Allies, on the other hand, are not only not contiguous with each other, but we are as widely separated as we well can be. Our most important ally, next to France, is Russia, and we cannot get at Russia. Even to take away a single individual or a single mission from Russia is a matter which the Admiralty has seriously to consider, and steps for which they have to work out with the utmost caution. Japan is at the extreme end of the world, we are separated geographically; but there is a much more important separation, and that is the separation of temperament, and the separation of history and tradition. It is really an extraordinary thing on which to reflect that of the five great powers now fighting on the Entente side, Japan and Russia were in death grips about 10 or 11 years ago. France and England were on the edge of war more than once, and on more than one subject, until the Entente arrangement was finally made in the year 1904. Italy was actually joined by treaty with the Central Powers as a counterpoise to France and Russia, whilst we and Russia were regarded as almost traditional enemies. I remember quite well in the first days of the Committee of Imperial Defence, which started in the year I think 1902 or 1903, we worked out the many problems with which the Empire was

then faced. What were they? How to prevent Russia getting India and how to deal with a war with France. That was 12 or more years ago. Now the change which has been brought about largely by German ambition backed by German diplomacy, which is the worst diplomacy in the world, has welded all those nations into one coalition determined to put down this world tyranny. We have to accept the fact that residues of the old condition of things must to a certain extent remain, and one of the diplomatic troubles which we have to deal with for example, is the eternal jealousy between Italy and France. It is curious that these two Latin nations, one of which owes so much to the other because, without France, Italy would hardly have gained her unity, in spite of that they cannot get on with each other. We are the link between the two. I think if you were to ask the First Lord of the Admiralty, he would tell you that one of our difficulties in the Adriatic is that the French will not work under the Italians. We ourselves are quite ready to do so. We have sent ships to help them and our ships work under an Italian admiral; but the French will not do this. In the Eastern Mediterranean there is jealousy at this moment which is hampering our diplomacy, I do not say in a serious way, but it is vexatious and irritating. Greece, which is the scandal of contemporary diplomacy, is a scandal because three nations—the French, the English, and the Italians—are trying to manage her, and all of whom have divergent views. The Italians detest M. Venizelos—I do not know why—but they appear to think that under M. Venizelos Greece might attain to a position of influence in the Aegean Sea, which is inimical to the ambitions of Italy. Merely as a characteristic mark of what is going on, the Italians have been sending troops to Corfu, but nobody knows why. We cannot get any explanation. The French say, "Cannot you send even a corporal's guard so that the British flag may be hoisted there as well as the French, the Greek, and the Italian?" Broadly speaking, however, everything is working well with the exception of these little elements of discord, which are very vexatious to the Foreign Office but which I hope will not profoundly modify the general course of the war.

"I do not want to go at length into the question of Japan because that is too large, but perhaps I ought to say a little about it. The great Dominions and the United States of America are naturally, and I think rightly, jealous of Japan's obtaining any footing within their territories. Japan, on the other hand, at present quite genuinely believes that what has been the sheet anchor of her policy for the last 12 years, namely, the British alliance, is still the sheet anchor of her present policy, and they still cling to that. Of course, we are talking quite privately, and I do not think we can conceal from ourselves that there is in every quarter of the eastern world a certain uneasiness as to whether Japan is in the future going to try and play the part in those regions which Prussia has played in Europe—whether she is not going to aim at some kind of domination. That fear hangs over the world. I do not venture to give any opinion on that at all. Lord Grey held the view that if you are going to keep Japan out of North America, out of Canada, out of the United States, out of Australia, out of New Zealand, out of the islands south of the Equator in the Pacific, you could not forbid her to expand in China. A nation of that sort must have a safety valve somewhere, and although I think Lord Grey carried his doctrine to excess, I think there is something in it. I do not, however, propose to touch further on this question.

"As regards the war in the immediate future, I have, myself, no doubt that Japan, with an eye to her own interests, is quite genuinely helping the Allies, and helping the Allies to the best of her ability. She is making money; unlike the rest of us, she is doing well; but I do not think we ought to undertake the services she has given or the services she is giving; and the present administration, so far as I can judge, is incomparably more reasonable in its Chinese policy than the ministry which immediately preceded it. They are making great professions of leaving China to work out her own salvation. Whether these professions will be carried out to the full remains to be seen, but certainly I have not observed anything at present which ought to inspire us with suspicion. I do not believe suspicion is well placed. The only reason for which I mention that is I am told at this moment the Germans still have hopes of detaching Japan. That telegram which was sent to Mexico and which produced all that excitement, you remember, suggested that Mexico should act as an intermediary bet een Japan and Germany. I do not know whether you have that in your minds. The plan was to bring in Japan on the German side. I believe that was one of Germany's extraordinary blunders which she is always making, and I do not myself look forward with the least apprehension to anything that Japan is likely to do during the course of the war.

"If I turn from these considerations, which affect the Allies, to the diplomatic relations between the Allies and the Central Powers other than the immediate military relations between the Allies and the Central Powers, the most important question is, Are the terms of peace to which we are committed of a kind which are unnecessarily going to prolong the war? There is no doubt that Germany, as we have heard today, is in very great peril. How are they keeping up the spirits of their people? They are keeping them up in two ways. They are saying in the first place that England will succumb under the submarine warfare. They are saying in the second place, 'You must go on fighting at whatever sacrifice, because, if you do not win, our enemies are determined not merely to beat us but to destroy us'; and every nation worth anything, of course, will fight to the last crust of bread and to the last cartridge, if its actual destruction is going to be the result of an unsuccessful war.

"The practical destruction of the Turkish Empire is undoubtedly one of the objects which we desire to attain. The Turks may well be left—I hope they will be left—in a more or less independent position in Asia Minor. If we are successful unquestionably Turkey will be deprived of all that in the larger sense may be called Arabia; she will be deprived of the most important portions of the valley of the Euphrates and the Tigris; she will lose Constantinople; and Syria, Armenia, and the southern parts of Asia Minor will, if not annexed by the Entente Powers, probably fall more or less under their domination.

"If we turn from Turkey, however, to Austria, the position is somewhat different. According to rumors, which you must all have heard, Austria is so exhausted that she would desire to have a separate peace; but, again, one of the difficulties about a separate peace is what, by the terms as interpreted in our note to President Wilson, will be left of Austria if we do make a separate peace? We have entered into treaties with Italy, Rumania, and Serbia, all of which affect Austrian territory. Italy, who came into the war in April, I think it was, of 1915, opened her mouth rather widely; that is Italy's way; and she not only got the Allies to promise her Italian Irredenta, the populations bordering upon her frontier who are of Italian origin, speak Italian, and possess Italian culture, but she asked also for parts of Dalmatia, which, neither ethnologically nor for any other valid reason, can be regarded as a natural part of Italy. Her justification, however, was not ethnological; it was purely military or, rather, naval. Italy is very unfortunately situated in the Adriatic; she possesses the whole of the western seaboard of that sea, but along her coasts from Venice to Brindisi there is nothing really which deserves to be called a harbor at all.

"But opposite, threatening her, within easy striking distance and within a few hours' steam, there is the coast of Dalmatia with its islands and its harbors contrived by nature to suit modern submarine warfare, and it is most natural that Italy should say: We should like, in our own interests and for our own protection, to possess this coast. Except from that military point of view I am not aware that it is easy to justify handing over the Dalmatian coast, which is not Italian, to Italy. But there it is, it is in the treaty to which we are bound. We, the French, the Russians, and the Italians, are bound to each other never to make peace without the other, and among the conditions which we have mutually promised are these cessions of territory which so far as Italy is concerned, I have just described.

"If you turn to Serbia, we promised Serbia Bosnia and Herzegovina, and I think that it is a most legitimate promise. They are of the same race, of the same language, and of the same religion. They are not old provinces of Austria; they were Turkish provinces up to the Treaty of 1878 in the full sense of the word, and after 1878, until 1908, when Austria broke through the Treaty of Berlin, they were still Turkish provinces in name, though not in administration or in any other substantial sense. Still, they are not old provinces of Austria and if Austria lost them nobody could say that Austria was destroyed. If you go a little further north and ask how you are going to treat the Slav population which also speaks the same form of Slav language, the Croat and other Slav communities to the south of the Danube you undoubtedly are going to make a great breach in the traditional Austrian Empire. But I am not aware that we are by treaty bound in any sense to do that.

"The PRIME MINISTER. The promise to Serbia was conditional.

"Sir ROBERT BORDEN. Did we promise anything more than Bosnia and Herzegovina?

"Mr. BALFOUR. We promised an outlet to the Adriatic.

"The PRIME MINISTER. We wanted Serbia to give up a certain portion of Macedonia to Bulgaria, and then we said, 'If you do this when the settlement comes we will give you these Provinces, the population of which are more or less akin to your own. If the war is won by the Allies then we will give you access to the Adriatic.

"Mr. BALFOUR. I do not see that so far as Italy and Serbia are concerned it can be said that even if we had the sort of peace we liked it could be said that we had destroyed Austria, certainly not the historic Austria, the Austria of the eighteenth century, in any sense of the word at all.

"When you come to our promises to Rumania and our promises in connection with Poland, in connection with which I shall speak presently, the case is different. We promised Rumania, if she came in, that that part of Hungary which is predominantly Rumanian in race and in language should be handed over to Rumania. There are people who say that there are Rumanians in Hungry who do not wish to be handed over to Rumania. I do not know whether that is true or not; I should doubt it. But at all events, it is undeniable that to take away the Rumanian part of Hungary, namely Transylvania, and hand that to Rumania is to break up historic Hungary. That does touch the historic kingdom of Hungary. (But Transylvania went to Rumania.)

"As regards another historic kingdom with an important past—Bohemia. Bohemia is predominantly Slav in language and in civilization. It differs, of course, from the southern Slavs, from the Serbs, for instance, in being Roman Catholic in religion and in speaking a language of a variety of Slav which is very different from that spoken by their brothers farther south. It has a history and a tradition of its own. It has been quite abominably used by Austria in this war. If all accounts are true, Bohemia has a hatred of German civilization and German propaganda which is intense and I think inextinguishable. Whether, however, all those feelings could not be adequately satisfied by giving Bohemia some form of autonomy in the Austrian Empire I am not so clear. I happened to meet a few months before his assassination with the poor

man who was the beginning of all our troubles. He was then heir to the Austrian throne, and he had a view that the only way to keep Austria together was to make it a triple state instead of a dual state.

"At present it is a dual State which is the Austro-Hungarian Empire. He wanted to make a third element in the empire, namely a southern Slav. It seems to me that if you made it a quadruple empire and gave Bohemia autonomy, it would be a very curious construction, but not more curious than Austria has been through all these centuries, and it might really meet the views of the populations without absolutely destroying Austria as history knows it. But I am afraid that does not touch the Rumanian difficulty. I do not see any way out of that at present.

"With regard to Poland, I do not think you can call the Polish part of Austria—in fact, it would be absurd to call it a part of historic Austria; it became Austrian because Frederick the Great, Catherine II, and Maria Theresa chose to cut up Poland and divide it among themselves. Galicia is not part of historic Austria, and might and ought to go to the Poland of the future. But what of the Poland of the future? That, I think, is now, as it has been ever since the great crime of partition was accomplished, the greatest crux of European diplomacy. A very distinguished Pole came to see me yesterday, whose name I will not even venture to pronounce (Lord R. Cecil: Mr. Dmowski) but he is a man of very high character and great position. He is an ardent advocate for a completely independent Poland which should include all the Poles. But, I asked him: 'What relations does the Poland that you desire, the Polish Poland that you desire created, bear to the Poland of 1772, the year of the first partition?' 'Well,' he said, 'I quite agree you cannot precisely follow those old frontiers.' Part of what was then Poland is more Russian than Polish—the eastern part of it—and we could not ask that it should be taken from Russia and handed over to Poland. On the other hand, there is a part of Upper Silesia which had been taken from ancient Poland before the partition; Frederick the Great, in fact, took it from Austria. 'That,' he said, 'is quite genuinely Polish.' I think, he said, 80 percent of the inhabitants of the Polish area of Silesia were Poles by birth and Poles by language; and in his view that ought to be added to Poland. Then I said to him, 'Well, what about Danzig?' Danzig, as you will remember, is one of the old Hanseatic towns, and undoubtedly, subject to its municipal independence, it was part of the Polish kingdom. But I suspect, myself, it has been practically German for many centuries; it is certainly predominantly German at this moment. The country immediately around it, or a great deal of the country in its immediate neighborhood, is just as Polish as other parts of Poland; at any rate, more than 50 percent are Poles. But here comes the difficulty. He said, without Danzig, Poland is impossible. Danzig is the one outlet, the one adequate outlet to the sea, which the restored Poland would have, and unless you are prepared to give back Danzig to Poland it is useless to try and create a really flourishing modern State. Of course, you will remember Danzig belonged to Poland at the time of the partition. In fact, it belonged to Poland after the first partition. Frederick the Great was content not to take it at that time because he said, with great truth, that 'Anybody who has the Vistula, or the upper waters of the Vistula, will become in time the owner of Danzig'; as indeed he did become; but still, I think everybody must admit that to take away Danzig from Germany would be to deprive Germany of a town which is predominantly German; but if you have the map in your mind, it cuts off Konigsberg, and all east Prussia from the rest of the Prussian State, and therefore undoubtedly that is a thing which would touch German emotions and German interests very quickly. Konigsberg and East Prussia would become a kind of enclave, separate from Germany, but remaining German, embedded in a Polish and Russian framework. The difficulties of that are very great, but you see you are in a dilemma, according to my friend, whether Poland is absolutely independent, as he desires, or whether it becomes an autonomous State, bound more or less closely to Russia. However that may be, whether you include Danzig or not, any idea to make a Poland which does not include Posen is, in his view, destroying Poland. On the other hand, Posen is, at present, a very integral part of Germany, and Germany, no doubt would feel that if Posen were taken by a power which was potentially a great power, it would bring it very close up to the gates of Berlin. And yet, supposing we are successful, can we allow this war to come to an end without doing something substantially to get rid of the Polish scandal? It is true that Poland brought it upon herself. If Poland had understood the elements of reasonably good government, the idea that she could be partitioned like an inert mass, as she was, is out of the question. But that is in the past, and it is quite possible that the Poland of the future will be a useful member of the European community; but until she is satisfied you will have the nucleus of bitter discontent, and a nation going back to great and glorious memories, when it was the most powerful State in eastern Europe. I frankly admit that when the Germans say that we are fighting for a cause which means their destruction, it is not true in one sense; we are not destroying a German Germany, but we are trying to destroy the rather artificial creation of the modern Prussia, which includes many Slav elements which never belonged to Germany until about 140 years ago, and ought, really, not to belong to Germany at this moment.

"I am afraid I am merely stating difficulties; I am sorry to say I am not solving them. If we are not successful in the war, there is no hope of solving them. If the war is a drawn battle, these great causes, I am afraid, will never be satisfactorily dealt with by us. If we win triumphantly, then we shall be able to deal with them. Let me return for a moment to my Polish friend. He urged me very strongly to make a public appeal now on behalf of Poland. 'Now,' said he, 'that the Czar has gone, the Entente nations ought to announce publicly that they are going to establish an independent Poland; and if you do not do that,' he said, 'there is great danger that the Germans may succeed in the future in doing what they have failed to do in the past, which is to raise a Polish army.'

"His view was, that the recruiting of this Polish army had largely failed because the magnates whether ecclesiastical or lay in Poland had taken the oath of allegiance to the Tsar and were not prepared to break it. The Tsar has gone, the oath has gone, and he declared that his view was that the constant pressure of Germany, after this particular doubt had been removed, might succeed in producing this great addition to her manpower. If it did, the effect upon the Allied cause would undoubtedly be most serious. He put the numbers down at between 700,000 and 1,000,000. Supposing Poland came in, in that way, on the side of the central powers, and supposing Russia fell into disorganization and military chaos, the whole of the position in the east would be changed disastrously for the worse. Whether we are in a position to proclaim our intentions with regard to Poland, and whether, if we did, it would have the effect which he says, I do not know; I think, very likely, it would. I put this question to him: 'The Czar has gone, and with the Czar one obstacle may have gone, but can you ask this new Russian Government to begin its career by handing over what the Russians regard as an indisputable part of their territory?' He seemed to think it would be possible. I confess I have my doubts. I am sending an account of this conversation to Sir George Buchanan and I shall be interested to hear what he says about it.

"Personally, from a selfish western point of view, I would rather that Poland was autonomous under the Russians, because if you make an absolutely independent Poland, lying between Russia and the central states, you cut off Russia altogether from the west. Russia ceases to be a factor in western politics, or almost ceases. She will be largely divided from Austria by Rumania. She will be divided from Germany by the new Polish state; and she will not be coterminous with any of the belligerents. And if Germany has designs in the future upon France or the west, I think she will be protected by this new state from any action on the part of Russia, and I am not at all sure that that is to the interests of western civilization. It is a problem which has greatly exercised my mind, and for which I do not see a clear solution. These are disjointed observations in regard to Poland; they lead to no clear-cut recommendation on my part. I am not pleading for a cause; I am trying to lay before the Cabinet the various elements in the problem as they strike me.

"The next branch of the subject on which I have anything to say is the smaller neutrals.

"Sir ROBERT BORDEN. Is there any point about Belgium?

"Mr. BALFOUR. With regard to Belgium I think I can very shortly describe the position to the Cabinet. It is more an economic than a diplomatic problem. I take it that whatever we fight for we fight for the restoration of Belgium to her old limits and her old condition of independence and prosperity. The Belgian Minister has more than once been to see me and has put to me this problem. He said: 'All of us, every nation will after the war, have to face a whole series of new and difficult questions, social, economic, military; the upsetting of everything is so complete, that there is not a nation in the world that will not have to face a new set of things, and do their very best to solve the problem raised.' All that is true of Belgium. But what is true of Belgium is true to some extent of no other country. Unless the Allies will, while the war is going on, make preparation to help Belgium, when peace comes, even though its independence be restored and its old frontiers established, she will be left derelict; it is an industrial community, thickly populated, depending for its very livelihood and bread for the people upon mining and upon manufactures. The Germans have not only overrun the country, but they have taken away all the machinery, all the raw materials, they have practically taken away everything for the carrying on of the elementary economic effort of the country, and it is impossible for Belgium to make itself again a going concern unless the Allies are prepared at the moment of peace, at the first moment possible, to pour in the raw material, to supply the machinery to make Belgium, in other words, something like what it was before the Germans overwhelmed it. I have no answer to that; I believe what he said is perfectly true, and I believe the appeal which the Belgian Minister makes to the Allies is one which ought to be considered. We are overwhelmed with work; my office can do nothing; I am not sure what office ought to do it. So great is the pressure that I have not had time to put this case before the Prime Minister and our smaller cabinet. I only circulated an account of my conversation with the Belgian Minister, but the question must be raised and it must be faced. I think it is one of the most important things, outside the war itself; but how it is to be done, other ministers and other departments must say.

"Sir JOSEPH WARD. In regard to that restoration of machinery, do you mean prior to the rebuilding of the devastated Belgium?

"Mr. BALFOUR. I think we ought to be ready to pour it into the country if we can.

"The PRIME MINISTER. It is impossible for the simple reason that all our available manufacturing capacity is put to urgent war work. If we have anything to spare, we put it into agricultural work.

"Mr. BALFOUR. Perhaps I should add that in my view, the notion which is going through the German mind that they can restore Belgian independence enough to satisfy the world, and yet keep a grip upon Belgian economic life, and Belgian ports, I regard as absolutely inadmissable. I think that is almost as bad as annexing Belgium, and I would fight against it to the last drop of my blood. I do not think that is arguable.

"As regards the neutrals—the small neutrals I mean—Sweden and Royalist Greece, which must be regarded as more or less hostile; Spain and Holland, which I think are friendly, but more doubtful; Norway and Denmark, which are certainly very weak, especially Denmark, there is a great deal of important diplomatic work and Foreign Office work done with these countries; but most of that work really belongs to my colleague, the Minister of Blockade, and measured by telegrams it is far greater, I believe, than that of all the other offices of state put together; but he will make a statement upon the subject. I do not believe I have anything more to say except this one observation.

"Mr. AUSTEN CHAMBERLAIN. Are you going to say anything more about German aims in the Middle East and their consequence to us?

"Mr. BALFOUR. I feel intensely upon that question. It was referred to, I think, by the Prime Minister in his statement the day before yesterday, but I am quite ready to say something about it if you think it desirable. This war has been described, and quite accurately I think, as a war against the world domination of Germany, but I think that Germany after all was not equally anxious to have world domination in every direction at one and the same time. What Germany wanted to do was not to make every country equally subservient to her economic designs; I think her economic ambitions in these later years were largely directed, not, of course, wholly, but largely directed to developing the communications between Germany, through Austria, through subordinate states like Bulgaria and Turkey to the Persian Gulf and ultimately to India and the Far East. All the German literature of the last 10 years is full of these dreams. Germany has borrowed a great deal from Napoleon; almost always the worst things of Napoleon's. These are the dreams and they have eaten very deeply into the social imagination of the whole community. They picture to themselves Asia Minor, the valleys of the Euphrates and the Tigris and beyond, India and the East; they picture that as a happy field where German enterprise can reign undisturbed. They found Great Britain and the United States had got before them in entirely new countries. South America they were nibbling at, but they had never made up their minds to deal with it. But they thought they had a really fair field in these oriental regions, and I believe that it was within their power to do it. I believe that if they were successful in this war, they would do it and that their success would undoubtedly adversely affect the British Empire. I will not say the British Empire would fall, I do not think it would, but it would have a very severe struggle for existence and the whole balance of the world's trade and the world's power would be altered. The Dominions like Australia and New Zealand would be in an entirely different position from what they are now. India would be in an entirely different position from what it is now, and I am not at all sure that among the dangers of German domination, which every country has to fear, the particular dangers that arise through their being able to establish an unbroken avenue of influence from the North Sea to the Persian Gulf is not the greatest of all. I think whatever else happens in the war, that recent events have upset that dream, and I do not think that things could possibly go so badly that Germany could piece together the scattered fragments of this structure which they are striving to complete. In that particular I think we have been successful. I wish I could feel that our success was as complete in other fields of operation and that we could look forward with equal confidence to breaking the designs of Germany in Europe as I hope we have been now in breaking her designs in Turkey and the Middle East generally.

"Mr. MASSEY. Can you tell us anything with regard to the French Provinces of Alsace and Lorraine?

"Mr. BALFOUR. The importance of Alsace and Lorraine is twofold. In the first place, if we could transfer them back to France we should, I think, do something to improve the equilibrium of Europe. You would remove a population which does not wish to be under Germany to France which it does wish to be under. You would further increase the population of France relative to the population of Germany, which undoubtedly must make for the equilibrium of Europe, and because it makes for the equilibrium of Europe, makes also for the peace of the world. Then there is another point. Since Alsace and Lorraine were taken by Germany, means have been found to utilize the great iron deposits of Lorraine to an extent which makes them a very formidable adjunct to Germany's industrial power. I frankly admit that I should very much like to see these great fields of industrial enterprise restored to their original owners. Germany's strength in coal and steel is an absolutely new phenomenon, you must remember, since the War of 1870, and it is one of the most formidable factors in her success in this war.

"The PRIME MINISTER. And it is one you cannot touch by the blockade.

"Mr. BALFOUR. I was told that when the war broke out, Germany had a greater power of producing munitions at the moment than the whole of the rest of the world put together. She owed that, of course, partly to her desire to be prepared in a military sense, but partly to these enormous resources which she has developed since 1870, of which the iron and coal fields west of the Rhine are an important part and, therefore, from that point of view as well as from the more strictly political and diplomatic point of view, I should be most desirous to see Alsace and Lorraine restored to France. I am told that the French are not so eager about them as they were. Or let me put it rather differently; I am told that the war-weariness in certain sections of French society in consequence of their terrific losses and the general burdens which the war has thrown upon them are so great that if they could get an honorable peace, even without Alsace and Lorraine, or even a small fragment of Alsace and Lorraine, they might be content to take it. I should be very disappointed if this war ends without the complete restoration of the ancient frontiers of France.

"The only other thing I have to say is that German atrocities have really had an important diplomatic effect. I think that when Lord Robert Cecil comes to speak, he will tell you how great an effect upon allied diplomacy has been the terrorism which Germany has inspired and produced in Holland, Denmark, and Norway. These countries are trembling at the German terrorism. They hate Germany, they hate the domination of Germany, but they feel that if they quarrel with Germany, they will be as Belgium is, and that is undoubtedly a very great diplomatic weapon in the hands of Germany. It is painful to have to admit it, but I think it is true.

"The PRIME MINISTER. I am sure we are very much obliged to the Secretary of State for Foreign Affairs for his most illuminating exposition. I do not know whether any members of the Cabinet would like to ask any further questions."

Wage and Hour Bill

EXTENSION OF REMARKS
OF
HON. MARTIN DIES
OF TEXAS
IN THE HOUSE OF REPRESENTATIVES
Thursday, December 9, 1937

STATEMENT BY H. C. FLEMING, PRESIDENT OF THE OIL WORKERS INTERNATIONAL UNION

Mr. DIES. Mr. Speaker, under the leave to extend my remarks in the RECORD I include the following statement by H. C. Fleming, president of the Oil Workers International Union, giving the grounds of the opposition of that organization to the pending wage and hour bill, and also an amendment proposed by him:

The petroleum industry made an extraordinary adjustment of hours of employment under the National Industrial Recovery Act, Code of Fair Competition for the Petroleum Industry, signed by the President August 19, 1933, and as a result the 36-hour workweek insofar as employees, other than clerical are concerned, became the maximum hours of work for the entire industry, and for the most part has continued in effect throughout the industry. There are, however, a few of the smaller companies that have conducted themselves beyond the law and failed, both under the Code of Fair Competition as well as now, to observe the universal application of the 36-hour workweek.

The proposed wage and hour bill provides for a 40-hour maximum workweek and a 40-cent minimum hourly rate. If this becomes the law of the land without suitable amendment applying particularly to the petroleum industry, it will defeat the very purpose that the act intends to accomplish; that is, added employment. This act would reduce the employment load in the petroleum industry approximately 18 percent, because the industry would take advantage of the specific fact that they have gone from 36 hours' employment as a standard week to 40 hours by direction of the Congress of the United States.

While it is true that certain collective bargaining agreements exist within the industry establishing 36 hours as a maximum workweek these companies would be faced with an unfair competitive relation with other oil companies if they attempted to maintain, by virtue of collective bargaining, 36 hours as against a 40-hour week that would become effective with the adoption of the bill by the Congress.

It is because of this special situation applying to the great petroleum industry that the attached amendment is proposed. All Congressmen coming from oil-producing and refining centers, such as the great refineries no the Atlantic seaboard, New Jersey,

Pennsylvania, Gulf Coast, Great Lakes, and Pacific coast, would be a party to increasing the hours of employment of their constituents 4 hours per week if they voted for the bill without the proposed amendment applying to the petroleum industry.

The 36-hour workweek in the petroleum industry is an accepted principle, and surely the great arm of the Federal Government is not going to be used to disturb this equitable principle which is now operating favorably, both to the employee and to the employer.

It is because of the unique situation as it affects the petroleum industry where we have weekly hours of employment less than the bill provides that we urge this special amendment to safeguard this forward-looking program established in 1933.

Amendment to wage and hour bill proposed by Mr. H. C. Fremming, president of the Oil Workers International Union, together with statement of Mr. Fremming explaining the position of his organization with respect to the pending bill and the need for this amendment to protect the workers in the oil industry.

AMENDMENT TO WAGES AND HOURS BILL NO. —, APPLYING TO THE PETROLEUM INDUSTRY ONLY

In drilling, production, refinery, and pipe-line operations the maximum hours for clerical employees shall not exceed 40 hours in any one week.

All other employees in these operations, except executives, supervisors, and their immediate staffs, and pumpers of "stripper wells", and employees on isolated properties, shall work not more than 40 hours in any 1 week, nor more than 72 hours in any 2 weeks, nor more than 16 hours in any 2 days.

The minimum daily rate of pay, based upon 6 hours maximum employment per day, shall be $5 per day.

The Housing Act

EXTENSION OF REMARKS
OF
HON. WILLIAM B. BARRY
OF NEW YORK
IN THE HOUSE OF REPRESENTATIVES
Thursday, December 9, 1937

Mr. BARRY. Mr. Speaker and Members of the House, Queens County, N. Y., which I have the honor of representing in Congress, this year leads all other cities and counties of the country in the building of new homes.

Between January 1 and November 1 this year a total of 5,346 building permits for dwellings to house 14,340 families were issued. The cost of this building program was estimated at $61,296,295.

Hearings are now being held before the Banking and Currency Committee on President Roosevelt's recommended amendments to the National Housing Act. The chief object of the proposal is to enable home builders to buy homes with a 10-percent down payment, financed through F. H. A. insured mortgages, the cost of which will not exceed $6,000.

While I am enthusiastically for this proposal, and I believe that it will encourage building throughout the country and be an important factor in restoring economic prosperity, I feel that some benefits should be offered to those people who can afford a home costing more than $6,000. In Queens County, where there is much active building going on at the present time, the average house costs somewhere between $6,000 and $10,000. Consequently, if the limitation is set at $6,000, a great many people in my county and similar counties will not be aided. The change in the law offers them no inducement to build homes.

The leading builders of Queens County on Long Island assure me that the new housing plan if extended to include dwellings costing over $6,000 will start a building boom and will attract a very responsible type of home builder.

In view of this situation, I therefore recommend that the home builder who desires, or is compelled to pay more than $6,000 for his home, be given the benefit of the 10-percent down payment on the first $6,000 of the price of his house, and thereafter pay a graduated increase until at a certain price the amount of down payment reaches 20 percent.

At the completion of the hearings before the Banking and Currency Committee, I intend to make such recommendations, and I hope that my colleagues in other parts of the country who are similarly affected will get in touch with the members of the Banking and Currency Committee and recommend that my amendments be adopted.

Logrolling Farm Legislation

EXTENSION OF REMARKS
OF
HON. WILLIAM LEMKE
OF NORTH DAKOTA
IN THE HOUSE OF REPRESENTATIVES
Thursday, December 9, 1937

Mr. LEMKE. Mr. Speaker, we have now debated H. R. 8505, known as the Jones bill, being the bill that the Agricultural Committee reported out, for about 10 days, and the more we have debated it and the more we have amended it the worse it has become. This bill is not what the farmers want nor what they expected. The best friends of the administration are those of us who are opposing this bill and who still feel that at this late hour this administration may be saved from the responsibility of the enactment of this bill.

I have not yet discovered a single Member of Congress, except some of the members of the committee, who is for the bill and who does not secretly wish its defeat. Not a single farm organization now defends this bill. Even Ed O'Neil, of the Farm Bureau, whom we once suspected of being the bill's daddy, now disowns this monstrosity. He is reported to have stated that the Secretary of Agriculture was running out on him. I am very much afraid that his members have been walking out on him.

Well, it will take a lot of running out if this monstrosity is finally forced through Congress and enacted into law in its present form. The bill as now amended is the result of sectional logrolling. It consists of many contradictory parts. If it becomes a law, it will continue to divide the people along sectional lines. It will lead not only to hatred and sectionalism but it may end in disaster.

It is for this reason that I am joining with friends on the Democratic side of the aisle in the hope that we may save the day by substituting the Eicher-Massingale cost of production bills, H. R. 8521 and H. R. 8522. These two bills are identical. I give below a comparison between the Jones bill, which is the committee bill, and the Eicher-Massingale bill.

THE JONES BILL—H. R. 8505	THE EICHER-MASSINGALE COST-OF-PRODUCTION BILL—H. R. 8521 AND 8522
1. Is unquestionably unconstitutional.	1. The powers of the Federal Government to be exercised under this bill are well within the constitutional authority of Congress.
2. Under the Jones bill Congress decides and determines no policy with reference to the stability of agriculture, and leaves wide and undefined discretion in the control of farm production.	2. Under the Eicher-Massingale bill Congress determines and defines a definite policy with reference to the minimum of farm income, our domestic agricultural economy, the handling of surplus farm commodities, and the stability of American agriculture.
3. It is indefinite, complicated, incapable of being understood by Congress, by proposed administrators, by farmers—therefore, unworkable.	3. It is simple and direct, easily understood by Congress, proposed administrators, farmers. It is capable of accomplishing the objectives and therefore workable.
4. The operation of the Jones bill would take the American farmer out of the foreign market and would	4. The Eicher-Massingale bill will fully protect our American farmers in the domestic market and will

THE JONES BILL—H. R. 8505—CON.

put the foreign farmer into our domestic market.

5. The operation of the bill and the powers contained in it would freeze the farm income under a limitation of price and a limitation of production which is less than the farmers' cost of production.

6. The Jones bill would reduce production of food and fiber at a time when the President says that one-third of the Nation is ill-fed and ill-clad.

7. The bill includes the Soil-Conservation Act and rearranges its provisions and payments.

8. The Jones bill would cost the Treasury from seven hundred and fifty million to more than a billion dollars.

9. There are no provisions in the Jones bill for financing this ambitious program and no suggestions as to how the money would be raised and where the money could possibly come from.

10. The bill aims directly at regimenting and controlling the farmer—his farm and his production—without provisions or methods for escape.

THE EICHER-MASSINGALE COST-OF-PRODUCTION BILL—H. R. 8521 AND 8522—continued

enable our farmers to contend for and compete in the world markets for our surplus farm production without injury and with benefit to our foreign trade.

5. The bill will assure the farmer of an income of not less than the average cost of production for his products consumed domestically and assures him of the world price, less the cost of handling, of whatever surplus farm production he may produce for the foreign market.

6. The operation of the Eicher-Massingale bill will increase and expand the consumption of farm commodities and the products of labor and will enable the farmer to produce freely for both our domestic and foreign markets to meet their increased demands at home and abroad and virtually eliminate unemployment and the necessity for there being an ill-fed and ill-clad one-third of the population.

7. The enactment of this bill will in no way interfere with the Soil Conservation Act, which extends to January 1942 but will enable the farmer with his new "security" and "out of income" to conserve and protect soil fertility and make soil-conservation payments unnecessary long prior to the expiration of the Soil Conservation Act.

8. The Eicher-Massingale bill will not cost the Government any money except a small initial capital investment and virtually the entire annual administrative cost will be deducted from the proceeds of surplus farm commodities.

9. This Eicher-Massingale bill requires no annual appropriations, no new levies, no new taxes, and definite and specific provision is made for the financing of the sale of export farm commodities from the proceeds thereof.

10. The bill gives the farmer liberty and freedom, assures him of security, protects his income at not less than the average cost of production, gives agriculture real equality and a comparable purchasing power with industry and labor.

THE JONES BILL—H. R. 8505—CON.

11. The provisions of the bill makes it doubtful and improbable that it can be put in operation during the year 1938.

12. The Jones bill would reduce the farmers to the status of Government wards, will keep them permanently on the dole and regimented as serfs and incompetents. Cash payments from the Treasury can neither be determined or sustained year after year. The Government cannot borrow and sources of taxation cannot be found with farm production reduced and farm income limited and agriculture impoverished.

THE EICHER-MASSINGALE COST-OF-PRODUCTION BILL—H. R. 8521 AND 8522—continued

11. The bill can be put into operation and be effective within 60 days after it becomes a law. There is fully 6 months time before the bill would need to be in operation in order to be fully effective on the 1938 commodities under the terms of the bill.

12. The Eicher-Massingale bill is politically and economically sound. It involves no annual cost to the Treasury. The bill will put more than a majority of our 6,800,000 farmers into the income tax paying class under present rate schedules. It will enable our farmers to be financial supporters of the Federal Government—not recipients of doles. It will enable farmers to balance their own budget—contribute to the balancing of the Federal Budget, enable farmers to keep and own their own homes, will enable tenants to become home owners without further financial assistance from the Federal Treasury.

Federal-Aid Highways

Congress should not reduce the Federal aid to the States for road construction. Such action will be disastrous to highway-building programs of the various States, unemployment will increase, and beneficial public works will be stopped. Congress should instead increase allotment to the States up to full amount of Federal taxation revenue derived from gasoline and automotive taxes. This action by Congress would divert highway-tax money to other governmental purposes, a practice for which the Federal Government now penalizes the States.

EXTENSION OF REMARKS

OF

HON. DEWEY W. JOHNSON

OF MINNESOTA

IN THE HOUSE OF REPRESENTATIVES

Thursday, December 9, 1937

Mr. JOHNSON of Minnesota. Mr. Speaker, the President of the United States, on November 30, laid before this House a request for drastic retrenchment in the annual allotments of Federal aid to the various States for highway construction. This message of the President was his answer to widespread appeals in the press and over the radio by certain citizens that he use his powerful influence in behalf of retrenchment of governmental expenditures. Under this recommendation of the President the allotments would be cut down to $100,000,000 in a year, and would seriously hamper the recovery contributions of the various States to the solving of the unemployment problem while at the same time building great systems of national highways for the benefit and convenience of all the people of the Nation. I have prepared 22 questions and answers which analyze the history and application of the 1916 Hayden-Cartwright Act down to the present, generally as it applies to the Nation as a whole, and particularly as it applies to my own State

of Minnesota. I am sure that Members of this Congress will find that this analysis applies in each of their States, and I urge that they investigate the disastrous consequences to the highway programs in their own States. The 22 questions and answers follow:

1. Q. What is Federal aid to highways?

A. At present (for July 1, 1937, to July 1, 1938) it constitutes:

Regular Federal aid to trunk highways, requiring matching by equal funds from the State	$3,495,000
Funds for grade-crossing elimination, not requiring matching	1,343,000
Aid to improvement of secondary and feeder roads, to be matched by the counties	700,000
Total	5,538,000

2. Q. Is this a gift of the Federal Government to the States?

A. Not by any means. It is only a return to the States by the Federal Government of money collected by the Federal Government from those States, for highway purposes.

3. Q. What are the sources of these Federal-aid highway funds?

A. The United States Government will collect this year, according to the United States Treasury Department's own estimates, $349,900,000 from the road users of the Nation, $204,000,000 of it in gas taxes and $145,900,000 in automotive excises.

4. Q. How much of this will be collected from the motor-vehicle operators of Minnesota?

A. Approximately $8,500,000.

5. Q. If Federal aid is continued next year, will Minnesota be getting back for roads more than it pays in Federal road-user's taxes?

A. No. If the full Federal-aid program, set up by Congress back in 1936 for next year's allotments, is carried out, the United States Government will pay to the States in Federal aid only $238,000,000 of the $349,900,000 it collects from motorists.

It will pay back for highways in Minnesota less than $5,600,000 of the $8,500,000 it collects from Minnesota highway users.

6. Q. What will be the principle established if all Federal aid is canceled for next year, as the President has suggested to Congress?

A. The United States Government would be overturning a principle of many years standing, and would simply be diverting Federal highway revenues to purposes other than highway improvements—the $350,000,000 annual tax load on motor-vehicle owners would not be lightened 1 penny.

7. Q. Is this in line with or contrary to Federal precedent?

A. It is not only contrary to precedent, but a gross breach of contract with the States. In 1934, on June 18, the Congress of the United States wrote into the Federal Highways Act an amendment laying down this principle:

> It is unfair and unjust to tax motor-vehicle transportation unless the proceeds of such taxation are applied to the construction, improvement, or maintenance of highways * * *."

8. Q. What has been the attitude of the Federal Government toward diversion of highway revenues to nonhighway purposes?

A. Diversion has been so vigorously opposed that the United States Bureau of Public Roads, Department of Agriculture, has withheld Federal aid money from some States as a penalty for diversion of highway revenues. Yet, if Federal aid is canceled, or even reduced, the United States Government will be practicing exactly what it has forbidden the States to do.

ITS HISTORY AND PURPOSE

9. Q. Is this Federal aid something new in Federal-State relations?

A. No. The principle of Federal aid was established with the enactment of the first "Hayden-Cartwright bill" in 1916, two decades ago, setting up funds on a matching basis for payment to the States to encourage highway construction.

It has been continued ever since—for more than 20 years—and its increase in scope has been directly proportionate to the progress of Middle Western States in "pulling themselves out of the mud."

10. Q. What does this Hayden-Cartwright bill do?

A. It attempts to recognize the necessity of long-time planning in the wise and judicious use of funds for highway improvement. Therefore, through enactment of this bill, the Congress of the United States advises the States in advance how much Federal money they will receive through the Bureau of Public Roads for the 2-year period ahead.

For instance the Hayden-Cartwright bill, passed in 1936, set up annual funds of approximately: $125,000,000 regular matched Federal aid; $50,000,000 for grade-crossing elimination; $25,000,000 for secondary and feeder roads; $14,000,000 for forestry roads; and instructed the Secretary of Agriculture to divide and allot approximately these amounts to the various States, each year, for the years beginning on July 1 of 1937 and 1938. In other words, the Federal aid program, determining the funds which the States could expect to receive, was set up in 1936 for the biennium expiring July 1, 1939.

CONTRACTS AND BALANCE SHEETS

11. Q. If the President's recommendation is carried out, and all Federal aid canceled next year, does this or does it not constitute a breach of contract?

A. Yes; it constitutes a definite breach of contract with the States, for the Hayden-Cartwright Act, passed in 1936, promised these funds to the States for 1938 as well as 1937. It pledged Congress to make the actual appropriations when the time came, and even instructed the Secretary of Agriculture to make the allotments to the States before next January 1, 1938, for the fiscal year of July 1, 1938, to July 1, 1939. The President admitted in his message that it was a "contractual obligation," which he advocated be abolished.

On the strength of this promise, unviolated for 20 years, the States have proceeded to raise highway revenues with which to match promised Federal funds, and have proceeded with plans, engineering work, and programming of their highway projects accordingly.

12. Q. How does the balance stand now between the Federal and State Governments—that is, how do the amounts collected by the Federal Government in road-users levies and the amounts paid back to the States in Federal highway aid compare in dollars and cents?

A. Since the origin of the National Highway Act in 1916 the Federal Government has collected in taxes related to motor vehicles, that is from the road users of the Nation, a total of $2,033,922,000. During the same two decades it has returned to the States for highway improvement, even including the special highway aid and relief-employment appropriations of the past 5 years, only $1,987,655,000. (Authority: Treasury and Internal Revenue statistics submitted to United States Senate by Senator HAYDEN, November 30, 1937, CONGRESSIONAL RECORD, p. 502.) Therefore, the Federal Government has collected from the States, over the 20-year period, $46,000,000 more in highway revenues than it has returned to them for highway improvement.

13. Q. Has not the Federal Government, however, handed out to the States for highways vastly more money than it has collected from them during the so-called depression and recovery periods?

A. No. Surprising as it may be, even during these past 5 years, when the Federal Government was appropriating far more than ever before in emergency outlays to provide employment and revive business through highway construction, all appropriations for highway purposes total $1,490,000,000. During this same period, statistics of the United States Bureau of Internal Revenue show, the Federal Government collected from highway users in the various States $1,337,000,000, or almost as much as was being spent. Those who use the roads have paid virtually all the cost of work done with Federal funds on those roads, even during the emergency. (Authority: Treasury and Internal Revenue statistics submitted to United States Senate by Senator HAYDEN, November 30, 1937, CONGRESSIONAL RECORD, p. 502.)

14. Q. From what sources come these vast revenues?

A. The Secretary of the United States Treasury estimates that for the present fiscal year there will have been collected in gasoline and excise taxes from highway users:

SKETCH NO. 1

Federal gasoline tax (1 cent)	$204,000,000
Lubricating oils	33,300,000
Tires	37,000,000
Passenger cars and motorcycles	58,200,000
Trucks	8,100,000
Parts and accessories	9,300,000
	349,900,000

or, in round numbers, $350,000,000. (Authority: Treasury and Internal Revenue statistics submitted to United States Senate by Senator HAYDEN, November 30, 1937, CONGRESSIONAL RECORD, p. 791.)

15. Q. How much of this highway-users' money does the Hayden-Cartwright Act promise to return to the States for highway purposes next year; that is, if the Federal Government does not break its contract and cancel Federal aid?

A. The entire program of Federal aid, as now set up by the act of June 16, 1936, provides for expenditures in Federal highway improvement funds to the States of $238,000,000. Thus the entire Federal-aid program contemplated would return to the highways $112,000,000 less than the Federal Government collects from the highway users.

The highway users are far more than paying their own bill.

16. Q. In that case, why did the President ask Congress to cancel Federal aid?

A. To utilize these highway funds to balance the Budget.

17. Q. If this Federal aid is canceled to balance the Budget, what would be the result?

A. The entire sum would be collected from those who use the highways just as it is now—their load would not be lightened—but the money would go to other purposes in no way related to improvement of the roads. In other words, they would pay as much, but get none of it back. Minnesota would still contribute its $8,500,000 a year, but would lose the $5,500,000 a year it expected to get back for highway improvements.

On the other hand, if Federal levies on gasoline, motor vehicles, and allied products were reduced or repealed, in fairness to the users of the highways, then the Nation would be no nearer to balancing the Budget than if the diversion had never been undertaken in the first place.

Meanwhile highway improvement, made more necessary than ever before by the constantly and sharply increasing number of motor vehicles traveling at ever-increasing speeds, would virtually be brought to a standstill. Highway progress would cease, for highway development even now is dropping behind the ever-increasing highway demand.

HOW MUCH ARE WE SPENDING?

18. Q. There is abroad a general opinion to the effect that Minnesota has been expending unusually large sums for highway improvements in recent depression years, and, therefore, can afford a breathing spell. Is this true?

A. Absolutely not. In fact it is one of the most fallacious of public impressions.

19. Q. What are the facts?

A. During the 4-year period from 1929 to 1932, inclusive, the last 4 years of the old 7,000-mile State trunk highway system, the Minnesota State Highway Department received in revenues which could be expended for trunk-highway purposes a total of $99,211,456.64.

During the 4 years 1933–36, inclusive, with the State's trunk highway system increased by legislative action to 11,350 miles, the highway department received for expenditure for trunk highway purposes a total of only $76,329,923.04.

Therefore, the average yearly expenditure during 1929–32, including millions of dollars for maintenance as well as construction and improvement work, was $24,802,864.16, or, on 7,000 miles of trunk highways then existing, $3,686 per mile.

By contrast, the average yearly expenditure during 1933–36, including both maintenance and construction, was $19,082,480.76, or, on 11,350 miles of the enlarged trunk system, $1,064 per mile.

20. Q. Do these figures include the special aid given the State highway system through so-called recovery funds and direct grants for highway work?

A. Yes; all such funds are included. For instance, included in these revenues for the last 4-year period, are $20,955,954.35 in special Federal aid. Were this total for the years 1933–36 not included, the State would have had available for trunk-highway use only $55,373,968.69 for the entire period. This drop in normal revenue sources is due to two facts: First, the Minnesota Legislature in 1933 reduced automobile-license fees by nearly half, cutting State highway revenues by more than $4,000,000; second, regular Federal highway aid on a matching basis was so drastically reduced during 1934 and 1935, while large special work-relief appropriations were being allowed, that Minnesota's regular Federal-aid funds for the 4-year period 1933–36, totaled only $5,769,047.98, as compared to $15,261,697.09 for the previous 4-year period of 1929–32, despite a 65-percent increase in trunk-highway mileage.

The only Federal funds received in Minnesota for highway purposes during the 1933–36 period that are not included above are a total of $1,811,426.55 that was allotted to the State for county projects, forestry projects, and a planning survey. This money, none of it, could be spent on the State trunk-highway system.

It should here be noted that the special relief allotments to the States during the emergency period regarded the accomplishments in road building as secondary, and the provision of jobs for relief employment as primary, in importance.

It should also be noted that the money for such Federal funds given to the States was provided by Federal bond issues. If the Federal Government were to utilize the balance of $112,000,000 a year, between the money collected from highway users and the money allotted back to States for highway purposes, to retire such of these bonds as provided funds for highway work, it is doubtful if the highway users and motor-vehicle owners of the Nation would register any serious objection. They do object, however, to their highway taxes (which are levied in addition to their bearing their full share of other taxes) being used for entirely nonhighway purposes.

CAN WE FACE THE CONSEQUENCES?

21. Q. If Federal aid is canceled for next year, as the Chief Executive has proposed, and if it is drastically reduced by the 1938 Congress for the years to follow, what will be the effect on Minnesota?

A. Construction and improvement work on the State's 11,350 miles of trunk highways, except maintenance improvements will be brought virtually to a standstill on next July 1.

The program already drafted for next year, including projects already planned for and promised to communities in every section of the State, will have to be abandoned.

Instead of the nearly $10,000,000 construction program undertaken this year, Minnesota will be able to undertake only about a $3,000,000 program.

State money, levied on motorists and road users with the understanding that the Federal Government would match it dollar for dollar and make possible twice as large a program as the State would be paying for, will have to support the entire cost of this program.

Hundreds of miles of newly surfaced roads, treated with a light bituminous coating under agreement with the Bureau of Public Roads that they would be further improved from future Federal-aid funds, will have to be left to rapid deterioration under a traffic that they were never intended to bear for any long period of time.

Projects promised to close paving gaps in various sections of the State will have to be abandoned.

The State's proud program to halt the disastrous toll of human life and property damage, by construction of overheads and underpasses at dangerous railroad crossings, will have to be forgotten.

The highway department's plans to eliminate other death spots by widening, straightening, and "safetyizing" trunk roads in congested areas, bearing abnormally heavy traffic, will be reduced to the point of futility.

All of the State's 87 counties, which have programmed the use of $600,000 a year for 4 years in Federal money for improvement of their secondary and feeder roads, will see their hopes shattered and the financial burden of such roads thrown back on the county taxpayers.

Yet the motorists of Minnesota will still contribute their $8,500,000 a year to the Federal highway levies without getting any of it back.

22. Q. What would be the effect of Federal-aid cancelation on employment?

A. During the present year 18,000 man-jobs have been provided by work on the Minnesota trunk-highway system. Maintenance operations utilized 4,000 of these men. The other 14,000 jobs were provided by construction work.

If Federal aid is halted, at least 10,000 of these men will have to look to other than the construction industry for employment, or they and their families will have to turn to the depleted treasuries of local governments for relief.

In addition, thousands more, employed in the production of highway materials and the manufacture of highway-construction machinery, will be thrown out of work.

H. R. 1620

EXTENSION OF REMARKS
OF
HON. C. ARTHUR ANDERSON
OF MISSOURI
IN THE HOUSE OF REPRESENTATIVES
Thursday, December 9, 1937

STATEMENT OF ALBERT DEANE, OF NEW YORK, RELATIVE TO MUTUAL SECURITY

Mr. ANDERSON of Missouri. Mr. Speaker, the time has come to face a few simple facts regarding the economic situation in this country. There seems to be a lot of unrest and no one is happy. Labor blames the employer for its plight. The employer blames labor for disruption of business and mounting costs. The farmer blames the middleman for inadequate prices and his fellow farmers for overproduction. And everyone blames the Government and Congress for prevailing conditions.

The time is here to quit these efforts to find a "goat" for the economic disturbances from which every citizen of the Nation is suffering today, and to see if a solution, in which all groups in the Nation can collectively join, and which will, in turn, benefit every man, woman, and child, is not at hand.

On January 5, 1937, there was introduced in the House of Representatives by my good friend, FRANK W. BOYKIN, of Alabama, House bill No. 1620. That bill, if enacted into law, would provide the means of halting not only the present economic recession but of any future recession, no matter how induced. But more than that, it would provide a truly automatic method of permanently sustaining an effective demand for every type of agricultural, industrial, and commercial product or service which our people require or desire for a high standard of living.

Our workers need permanent security in the form of an opportunity to work in private industry at good wages. The plan provided for in the bill would give them such security.

Our farmers need the largest possible market at satisfactory prices for the products of their farms. The plan would provide such a market.

Business needs a constantly sustained demand for the products of industry. The plan would provide such a demand.

The professions need a consistent demand for their talents and services. The plan would provide such a demand.

In other words, the Nation as a whole needs to be assured of an effective and consistent demand for the products and services which result from its collective labor, whether brain or brawn—labor, the exercise of which is the only means of livelihood for all but a favored few.

The plan is fundamental in character and, like any smooth-running mechanism, would be simple in operation.

It does not attempt to cure the ills that beset one group at the expense of some other group, but would act as a governing device on the national economy as a whole. By sustaining the production of wealth at the highest practicable level at all times and insuring its economic distribution all groups would share alike to the maximum extent.

If we desire to sustain prosperity at a consistently high level we must know what we mean by prosperity and what we mean by a high level. The plan defines both.

Prosperity is a condition of universal employment in productive enterprise. A high level of prosperity, therefore, is the highest level of employment which has been obtained in the Nation as a whole over a past period of years.

The plan provides for the determination at the beginning of each year of the average weekly hours of employment of all eligible workers in the Nation over the previous 10 years. This would be called the long-time average.

It also provides for the determination of the average weekly hours of employment of all eligible workers at the close of each month. This monthly average would reflect the level of employment, and therefore production, at any given time.

Whenever, from whatever cause, the monthly average fell below the long-time average, we would know that something had happened to lower the effective demand calling for a continuation of production. Therefore the plan provides that immediately these indices indicate the initiation of such a recession there would be paid out of a central insurance reserve fund to each eligible employed worker in the country supplemental compensation to the extent of 1 percent of his basic compensation for each hour that the monthly average was below the long-time average.

For example, assuming that the long-time average was 40 hours and something happened to decrease employment so that the monthly average fell to 38 hours, immediately all eligible workers would receive out of the reserve fund 2 percent of the basic compensation received from their employers. The effect would be that whereas employment and production had fallen two points, incomes would have fallen slightly over one point. As production represents supply, and income or purchasing power represents demand, there would immediately be created a condition of demand above supply, which would cause supply to try to meet demand and thus induce reemployment, thereby correcting the recessional movement.

If the forces responsible for such a recession were sufficiently strong, employment might continue to decline for a period, but the lower the index fell below the long-time average, thereby increasing the percentage of supplemental compensation paid out of the reserve fund, the greater the differential in favor of demand above current supply and the stronger the pull toward reemployment. And it is inevitable that at some point the movement would reverse itself, and the monthly average would begin to reflect an upward rise.

Whenever the monthly average rose above the long-time average, indicating the initiation of an incipient boom, the plan provides that pay rolls would be taxed at the rate of 1¼ percent for each hour that the monthly average was above the long-time average.

This tax would be paid into the central-reserve fund to compensate for the payments made out of the fund in the form of supplemental compensation.

Inasmuch as the basic index provided for in a long-time average, there would always be, over a period of time, just as many hours above the average as below the average. Otherwise it would not be an average. Therefore, there is absolute assurance that the tax on pay rolls when hours

were more than the long-time average would be sufficient to cover the outgo from the fund whenever hours were below the long-time average.

In fact, as the tax on pay rolls would be at the rate of 1¼ percent per hour and the payments of supplemental compensation would be made at the rate of 1 percent per hour, there would be a differential of one-quarter percent per hour in favor of the fund. The plan provides that this excess shall be used to pay the basic compensation of any workers unable to secure employment in private enterprise, who would be given work on public projects. The effect of this provision would be to completely eliminate involuntary unemployment.

The details of the plan, with a complete explanation of the machinery necessary to make it operative, are covered in a pamphlet entitled "The Deane Plan" and I ask unanimous consent at this time, that this pamphlet be inserted and made a part of the RECORD.

The point of my speech is not to describe the detailed operation of the plan; that is covered by the bill and the pamphlet. My purpose is to call the attention of the Congress to the fact that we have before us a fundamentally sound and simple plan that would meet the demands of agriculture, labor, business, and the consumer, to take immediate action that will not alone correct the present recession but will provide, for the first time in history, a permanent governing device on the economy of the Nation, that would minimize the swings of the so-called business cycle, and the plan can be made effective within 90 days after enactment of the legislation provided for in the bill.

This plan provides advantages which, so far as I know, are not incorporated in any other suggestion that has been presented to this Congress, yet it would provide in a fundamentally sound manner for practically all the benefits which the various groups in the Nation have been demanding. It would permanently eliminate involuntary unemployment because employment at a living wage would be insured to any person unable to find employment in private enterprise. The effect would be job insurance in contrast with unemployment insurance, and public and private relief funds would be released for their true purpose—to care for the unemployables.

The corrective action of the plan would become effective immediately and automatically the moment a downward trend of employment, no matter how induced, brought the monthly average below long-time average, and the corrective action would continue until the balance was restored. This would assure industry as a whole a market at all times sufficient to sustain profitable production.

The plan would provide the worker with the most basic quality of well-being—permanent security.

Its basic operation would not depend on the discretionary power of any individual board or commission. It sets no arbitrary hours as standards. Instead it would make its adjustments from moving averages determined mathematically by actual production requirements.

It sets up no rules or regulations as to production, hours, wages, terms of employment, and so forth. The bargaining power of labor and of employers remains unimpaired. By keeping all workers employed and production at a high level, the demand for labor of itself would maintain the buying power of wages at a high level.

It would act automatically to raise consuming power whenever needed to justify investment in new producing capacity up to the limit of desire for any particular product.

It would tax only when business activity was at a high level; and, except in the case of employers who failed to distribute work at or below the long-time average when general business was below normal, the tax would be assessed as a like percentage of all pay rolls. Therefore, it would not change the competitive position of employers.

The combined result of the operation of the plan would be to hold employment and production close to the long-time average level, and thus eliminate the violent ups and downs of the business cycle as we have known them in the past. This would cause a steady and gradual rise in the standard of living of all of our people as technological and management technique increased the man-hour production of the Nation. Thus the plan would work to the economic advantage of every element in the Nation.

This plan has been widely studied by economists and other authorities of note and has been found fundamentally sound and practical of application.

THE DEANE PLAN FOR MUTUAL SECURITY—GUARANTEED JOBS WITH SUSTAINED INCOMES FOR THE WORKERS, SUSTAINED MARKETS FOR THE PRODUCTS OF INDUSTRY AND AGRICULTURE—A PROPOSAL FOR AUTOMATICALLY ELIMINATING UNEMPLOYMENT AND SUSTAINING PURCHASING POWER

(By ALBERT L. DEANE)

FOREWORD

During the greater portion of the 6 long years since 1929, business has been busily engaged in laying off each other's customers and clients. Yet everyone knows that customers with money to spend are a prerequisite to any profitable business enterprise or profession.

It would seem, therefore, that the problem of the moment, as well as of the future, is to find some method of keeping each other's customers employed at all times with incomes sufficient to provide an effective demand for a constantly increasing volume of profitable production of all the goods and services which our people desire and from which they derive their material satisfactions, whether the goods or services result from the pursuit of agriculture, manufacturing, trade, the professions, or the arts.

The proposal here presented is designed to provide security for the worker in industry and trade through the permanent elimination of unemployment and a sustained income, and security for the employer and professional man through a sustained market for the goods or services he sells.

The buying power of these groups, thus sustained, would provide the largest possible domestic market for the products of the farmers and agriculturists. With general employment in industry sustained at a high level, the demand for labor would attract workers from the less profitable farms into industry, with its new-found security, which would tend to eliminate the use of submarginal acreage. This would reduce the number engaged in agriculture and raise the average income of those who remain.

If the incomes of all other groups, particularly the primary group of workers, are sustained at a prosperity level, it will reflect itself in improved prices for agricultural products. This is not only because the domestic market, which takes the bulk of the farmer's output, can take more of his products at better prices; it is also due to the fact that increased consumption of all goods in this country means a corresponding increase in total imports. This increase in imports is the only possible source (outside of the export of capital) from which foreign nations can obtain the dollar exchange necessary for the purchase, not only of the farmers' surplus but of additional industrial products as well.

The plan is designed to answer, scientifically, the three basic questions:

1. What constitutes national economic prosperity?
2. How can any deviation from such prosperity level be measured immediately and accurately?
3. What can be done to correct, promptly and automatically, any such deviation?

INTRODUCTION

For the vast majority of our people, the ability to live, in the first place, and the ability to improve their standards of living, in the second, depend upon the income secured from a job, in most cases a job in industry or trade.

But the even flow of purchasing power is as necessary to industry and trade as it is to the individual, and the feat of economic engineering required to control this flow is no less important than the civil engineering skill which maintains the flow of water in streams that serve industry's purpose. Around Pittsburgh, the rivers are alternately flooded and dried up, if left to their own devices. But the steel industry needs big reservoirs of water for the mills and a flow in the canals sufficient to carry its raw materials and finished products. In this area, engineers have canalized the rivers, thus maintaining the water at a level necessary to keep its plants in operation. Similarly, the levels of purchasing power must be maintained if we are to have an orderly flow of production and trade through the streams of our industrial and business life.

Except for hoarding and the export of capital without a corresponding import of goods or services, the entire national income is expended for either producers' goods or consumers' goods. By "producers' goods" is meant goods and services the value of which depends upon their earning power. They include factories, machines, office buildings, transportation equipment, etc. By "consumers' goods" is meant all those goods and services intended for personal satisfaction and enjoyment. They include food, clothing, private dwellings, private motor cars, etc.

The demand for consumers' goods is the motive force behind all our economic activity. This demand gives value not only to the consumers' goods themselves, but to producers' goods as well. A factory is obviously of no value unless there is a demand for its product.

The demand for all consumers' goods cannot exceed the total purchasing power in the hands of those who want the goods. And the primary purchasing power of the Nation lies in the hands of

the mass of the people, the wage earner, and those receiving salaries. To sustain consumer demand it is necessary primarily to sustain their incomes.

What is here proposed is not a theory but an engineering technique—a permanent mechanism which would, first, supplement, out of a revolving reserve fund, the basic purchasing power of all workers whenever such an addition was required to maintain the normal flow of trade; second, permanently eliminate involuntary unemployment. The mechanism is automatic and self-regulating. It would become effective immediately whenever the man-hours of employment needed to produce the current demand for goods or services fell below the long-time average of man-hours required to fill a "prosperity" demand.

It would act as a shock-absorber for broken time and hence reduced purchasing power, creating, whenever needed, an excess purchasing power, which would provide a market for any excess production that had taken place, and stimulate production to increase to meet the increase in demand over current production—an "upward spiral" that would begin to turn as soon as production, work, and incomes sagged—a true corrective for the tailspin of depression.

Likewise, it would act to dampen a "boom" at its inception by automatically reducing effective demand—a true corrective for an inflationary trend.

ALBERT L. DEANE.

NEW YORK, *November 1, 1934.*
Revised January 1936.

Any plan designed to sustain national prosperity must tackle the problem from the standpoint of the Nation as a whole, that is, must act as a governor on the national economy. This is the fundamental basis of the Deane plan, which answers the three basic questions propounded in the foreword to this leaflet, as follows:

1. What constitutes national economic prosperity?

Answer. Universal employment in productive enterprise. In the Deane plan this is measured by taking, at the close of each year, the average weekly hours of employment over the previous 10 years, which is called the long-time average.

This long-time average would accurately measure prosperity, because it would reflect the highest average level of wealth-production which we had been able to attain, with our accumulated knowledge, within the system in which our economy functions. As this long-time average would be a moving average, determined at the close of each year for the previous 10 years, it constantly would reflect all national accomplishments (monetary, technological, social, etc.) in gradually overcoming recurrent checks on economic progress and well-being.

2. How can any deviation from such prosperity index be measured, immediately and accurately?

Answer. The level of employment for the previous month, taken at the close of each month, which in the Deane plan is called the monthly average, would show any deviation from the long-time average representing the prosperity level on which we want our economy to ride.

If the monthly average fell below the long-time average, it would show that a trend toward depression was under way. If it rose above the long-time average, it would show that a trend toward a boom period was under way. In either case, the adverse trend would be known immediately the deviation occurred, and the extent of the deviation would be shown.

3. What can be done to correct, promptly and automatically, any such deviation?

Answer. Under the Deane plan the income or buying power of all workers would be supplemented the moment a depression was indicated, out of a national reserve fund, and thus supplement falling demand. Or, pay rolls would be taxed the moment a boom was indicated, which tax, added to costs, would increase prices and thus dampen effective demand. The taxes would be used to reimburse the national reserve fund.

NOTE.—To those familiar with what has been published on the Deane plan heretofore it should be pointed out that the only important changes consist of the elimination of all features tending to regiment either the employer or employee.

Through this simplification it is possible to arrive at the long-time average and monthly average on the basis of the country as a whole rather than by industrial classifications. Instead of the payment of overtime premiums a pay-roll tax is substituted, paid by all employers alike only when their employment rises above the long-time average—that is, only when their business is prosperous, and with advance notice of the levy.

Supplemental compensation is also changed to the basis of a percentage of the basic compensation of the employee rather than one-half of his hourly rate. This eliminates the necessity of calculating hourly rates for employees paid on other than an hourly basis.

The basic characteristics of the plan remain intact—namely, the interplay of two mathematical averages as a device for accumulating and disbursing a self-liquidating reserve fund adequate to accomplish the purposes desired—(1) to sustain purchasing power at all times adequate to call for a continuation of maximum production, and (2) the complete elimination of involuntary unemployment.

DETAILS OF THE PLAN

Eligibles

Those eligible would include all employers in the United States, except those engaged in agriculture, employing one or more persons, regardless of the type of work, including the Federal Government, the States, and municipalities; all employed persons, except agricultural workers, and all persons registering for employment at a Government employment office. If desired, eligible employees could be limited to those receiving less than $60 per week, or any other arbitrary limitation, so long as the total purchasing power affected represented the greater share of the total national income.

Averages

At the close of each year the average weekly hours of employment of all eligibles for the previous 10 calendar years would be computed. The result would be called the long-time average and would represent the highest average level of employment that had been attained in the United States during the period. This moving average would be adjusted for upward or downward trends to correct for changes in production per man-hour of employment caused by technological progress or otherwise.

At the close of each month the average weekly hours of employment for the month would be computed from reports made by employers. The result would be called the monthly average and would represent the current level of production and employment.

Both averages would be published immediately upon determination.

The long-time average would become official for the following calendar year.

The monthly average would become official for the second month following. For example: The monthly average calculated from reports covering April would become the official monthly average for June.

Both averages would be calculated by dividing the total man-hours reported by employers, by the total number of their employees as of the last day of the period reported, plus those registered for employment with all Government employment offices as of the same day.

Supplemental compensation

Whenever the monthly average was below the long-time average, the pay of every eligible in the United States would be supplemented out of a national reserve fund by an amount equal to 1 percent for each hour or fraction thereof that the monthly average was below the long-time average. Such payments would be called supplemental compensation.

Example

Assume the long-time average is 40 hours and the monthly average is 36.

Employee receives from his employer, say $25 per week	$25.00
From the national reserve fund 4 percent (1 percent for each deficit hour or fraction thereof)	1.00
Total compensation	26.00

Payroll tax

Every employer would pay a payroll tax into the national reserve fund only when an employee was employed in any 6 months' period (January to June, July to December) more average weekly hours than the long-time average. The tax rate would be 1¼ percent on the total pay of such employee, for each excess hour above the long-time average.

Example

Assume the long-time average for 6 months' period is 40 hours.

Employee works a total of 1,118 hours during the period for which he receives total pay from his employer of, say, $670.80.

1118 ÷ 26 weeks (6 months) = 43
Less long-time average 40

Average weekly excess $3 \times 1\frac{1}{4}\% = 3\frac{3}{4}\%$ tax rate

$3\frac{3}{4}\%$ of $670.80 = $25.15 = total tax.

It should be noted that the pay-roll tax is assessed only for average hours above the long-time average. This means that if work is distributed so that workers are employed the long-time average hours or less, no taxes are paid.

Employment on public work

All eligibles unable to find private employment would be furnished employment, after a waiting period of 30 days, through Government employment offices.

In order to have preplanned work available to absorb the otherwise unemployed, the Government would secure competitive bids on projects covering types of work not competitive with private industry. Bids on a quantity of such projects would be kept available at all times and would provide a fixed price for a certain project on which applicants for preplanned work would be used exclusively at the minimum rate of pay fixed by the Government. As the need arose for putting additional men to work, these projects would be let in order of their importance. The minimum wages fixed for such work would be kept at approximately 20 percent below the current wage rate for common labor in the community, and such workers would be employed the number of hours per week represented by the monthly average.

Records and reports

Employers would report at the close of each month to the proper Government agency the total number of hours their employees had worked during the month and the number of eligible employees on their pay roll on the last working day of the month. This data would be taken from their customary pay-roll records, except as to hours of employment—that is, the only additional record not customarily kept by all employers would be a record of the total hours worked by each employee each month.

Disbursing supplemental compensation

Employers would pay their employees any supplemental compensation to which they were entitled and would be reimbursed immediately from the national reserve fund.

Payment of pay-roll tax

Biannually, as of June 30 and December 31, employers would remit to the Collector of Internal Revenue the amount of any pay-roll taxes due by reason of hours worked by their employees in excess of the long-time average, using forms provided for the purpose.

How the plan operates

The plan has two purposes: (a) the sustaining of mass purchasing power and (b) the permanent elimination of involuntary unemployment.

First, purchasing power would be sustained whenever it became inadequate to support a continuation of production, through the payment of supplemental compensation to the mass consumers of the Nation.

Whenever the current level of employment should fall below the long-time average, supplemental compensation would raise the purchasing power available for consumers' goods (demand) above the current level of employment, representing production (supply), absorb any surpluses that may have been created, and induce employment and production to return to the long-time average.

This would not only check the downward trend but reverse it, inasmuch as the corrective action would continue until a return to the long-time average was achieved.

This action is illustrated on chart B. (Not printed.)

It should be made plain that the long-time average is a moving average and that over a period there will be just as many hours above the average as there are hours below—or it would not be an average. By reason of the fact that the average when calculated would be a projection of what is expected to continue until the next yearly calculation, it is necessary to make a correction for an upward or downward trend, whichever it may be. Such correction would offset any actual error as soon as it was determined at the end of the period for which the projection had been made. Space forbids an explanation of the simple formula which has been worked out to make such correction and which results in the payments into the reserve fund balancing the disbursements from the fund, over a period, with mathematical certainty, as well as the method used to initiate the calculation of the long-time average, but both have been checked by competent mathematicians and may be accepted as scientifically correct.

The operation of the corrective force here described would become effective immediately and automatically the moment a reduction in hours of employment would otherwise initiate an adverse trend in Nation-wide consumer demand; and long before the condition would be sensed and action taken under any system which relied upon voluntary direction—and it would continue until the balance was restored.

Under our present system, any reduction in hours of employment initiates an immediate reduction in purchasing power, particularly of those in the smaller income brackets, who represent the primary and principal market for the total production of the Nation.

When workers are laid off, consuming power is cut proportionately. Those who remain employed reduce their buying in fear of losing their jobs, and, very promptly, the decline in consumption retards the rate of investment in new producers' goods (factories, machines, office buildings, etc.) which directly affects the purchasing power of the workers in those industries, and causes a further decline in production of consumers' goods, and so on—the "downward spiral."

Such result is inevitable under our present system. It is impossible under this proposal.

This plan, therefore, would act as a permanent "governor" on our economic machine, eliminating such violent fluctuations in production and business activity as we have experienced in the past.

Whenever, at any time in the future, and from whatever cause, the hours of work should fall below the long-time average, the payment of supplemental compensation would at once cause a rise in current production and employment. This would check the downward trend and force production and employment back to the moving long-time average level. This action is illustrated by chart C. (Not printed.)

Second. Involuntary unemployment would be permanently eliminated, inasmuch as any person unable to find employment in private industry could apply to a Government agency and would be furnished employment on preplanned work at minimum wages. The wages paid to such persons would be paid out of the national reserve fund.

Inasmuch as purchasing power would be sustained at all times adequate to sustain the continuation of "prosperity" production, the demand for labor in private industry would be sustained, so that the number of persons employed on preplanned public projects would be held to the minimum required by shifts in man-hour requirements due to competitive and obsolescence conditions affecting given employers or given localities.

Work sharing

The proposal incorporates a strong inducement for work-sharing in that the pay-roll tax on employers is assessed whenever, over a 6 months' period, the average weekly hours of employment of any worker is greater than the long-time average. Thus, employers could always avoid any tax, during periods when the monthly average was below the long-time average, by hiring sufficient employees to limit their average hours to the long-time average and thus avoid any increase in costs of production above a competitor who so distributed his work.

Yet, by taxing only for hours above the long-time average (the highest average the Nation had been able to attain over the previous 10 years), the compulsion would not be sufficiently severe to interfere with the efficiency of productive technique. Also, by using the average weekly hours of employment over a 6 months' period (January to June and July to December inclusive) the effect of seasonal demand on employment hours would be offset.

Effectuating the plan

1. Congress would pass the enabling legislation which would provide for:

(a) The creation of the National Employment Reserve Corporation, with a capital of $500,000,000 and with power to borrow, with Government guarantee, up to 10 times its capital (similar to Reconstruction Finance Corporation).

(b) The election of the board of directors of the corporation (representing business, labor, the public, and the Government) for staggered terms.

(c) The determination of the official long-time and monthly averages and their immediate publication by the corporation.

(d) The authorization for the payment by the corporation of supplemental compensation (similar to insurance benefits).

(e) The collection of pay-roll taxes (similar to premiums) on average weekly hours (over a 6-months' period—January to June and July to December) in excess of the official long-time average.

(f) The employment on public projects, let by competitive bids, of all eligible workers unable to find work in private employment.

While the corporation would be authorized to borrow, with the guarantee of the Government, such amounts as might be necessary and to pledge its future receipts as security for such loans, the plan itself insures with mathematical accuracy that its receipts, over a period, will cover its disbursements. The repayment of such loans would be absolutely assured, thus removing any strain on Government credit. The total cost to the Government, therefore, would be only the initial capital of the National Employment Reserve Corporation. The plan being essentially a mechanism for withholding from the total national effective buying power in "boom" times the exact amounts needed to sustain the total national effective buying power in times of depression.

Congress has the constitutional power to appropriate money for any purpose and therefore can appropriate money for supplemental compensation under the Deane plan. Congress has the further constitutional power to levy excise taxes to cover its appropriations. The tax for hours in excess of the long-time average under the Deane plan would be a true excise tax. Therefore there is no question of constitutionality.

Local Government employment offices (in small places the local post office) would be made available through which those eligibles unable to secure employment in private enterprise would be furnished employment on public work, either by the Government or by the States or municipalities upon Government authorization, their compensation to be paid out of the reserve fund. Such offices would report monthly to the corporation the number of workers so registered.

All employers of eligible employees would make a report (tax return) to the Department of Internal Revenue at the close of each month showing the number of their employees and the average weekly hours they had been employed.

The corporation would calculate and immediately publish the official monthly average (the total number of man-hours reported by employers for the previous month, divided by the total number of employees plus the number of registered eligibles reported by all local employment offices), and also the official long-time average, calculated at the close of each calendar year (being the average of all monthly averages for the 10 preceding calendar years, adjusted for the upward or downward trend, according to official formulae provided for in the enabling act).

At the initiation of the plan a special formula would be applied to existing data the effect of which would be to stimulate the current level of purchasing power by a predetermined percentage. Each year thereafter the formula provided would make corrections for the trend, so that at the end of 10 years and thereafter the long-time average would be based on accurate data developed monthly under the plan.

Employers would pay their employees each pay day any supplemental compensation to which they were entitled and would be reimbursed immediately by cashing at their local banks, drafts drawn on the reserve fund.

The corporation would pay, through its designated local employment offices, the wages of those eligibles employed on public projects.

The corporation would borrow, as the need arose, to meet the requirements for supplemental compensation, through the issuance of its bonds guaranteed by the Government as provided for in the enabling act.

The Department of Internal Revenue would credit the corporation with all pay roll taxes collected under the provisions of the act. By reason of the mathematical characteristics of the plan, the amount of taxes collected over a period would equal the amount disbursed for supplemental compensation, plus the wages

of those eligibles employed on public projects. Thus there would be created a revolving fund to keep our economic forces in balances—a true governor on our economic machine.

Effect of the plan of every element in the Nation

Employment at a living wage would be insured to any person unable to find employment in private enterprise. The result would be job insurance in contrast with unemployment insurance. Public and private relief funds would be released for their true purpose—to care for the unemployables. This saving alone probably would be sufficient to offset the taxes necessary under the plan.

It would provide the worker with the most basic quality of well-being—permanent security.

It sets up no rules or regulations as to production, hours, wages, terms of employment, etc. The bargaining power of labor and of employers remains unimpaired. By keeping all workers employed and production at a high level, the demand for labor, of itself, would maintain the buying power of wages at a high level.

The corrective action of the proposal would become effective immediately and automatically the moment a downward trend of employment, no matter how induced, brought the monthly average below the long-time average. And the corrective action would continue until the balance was restored. This would assure industry, as a whole, a market at all times sufficient to sustain profitable production.

Except in the case of employers who failed to distribute work at or below the long-time average when general business was below normal the tax would be assessed as a like percentage of all pay rolls. Therefore, it would not change the competitive position of employers.

The pay-roll tax would be reflected in higher prices only when business activity was above the long-time average level—that is, only when times were good. At such times the tax would tend to increase prices, which would have the desired effect in dampening the trend toward overexpansion. In other words, the tax becoming effective only when employment rose above the long-time average would have the reverse effect of the supplemental compensation paid only when hours fell below the long-time average.

It would act automatically to raise consuming power, whenever needed to give value to investment in producing capacity, up to the limit of desire for any particular product.

Its basic operation would not depend on the discretionary power of any individual, board, or commission. It sets no arbitrary hours as standards. Instead, it would make its adjustments from moving averages determined mathematically by actual production requirements adjusted for the trend of technological advance.

The net effect of the plan would be to hold employment and production close to the moving long-time average level and eliminate the violent ups and downs of the business cycle as we have known them in the past. This should cause a steady and gradual rise in the standard of living, as technological and management technique increased the man-hour production of the Nation, the plan insuring its economical distribution. The plan would work, therefore, to the economic advantage of every element in the community.

QUESTIONS AND ANSWERS

During the years since this plan was first proposed (1931), since which time it has been under continuous discussion, many questions have been asked regarding the details of its application. Similar questions surely will arise in the minds of the readers of this brief pamphlet. Perhaps the best way to answer your questions is to reproduce the answers to the questions which have been asked by others.

It is strongly recommended that those interested in a complete understanding of the Deane plan read the questions and answers hereinafter given.

Economic and general analysis on which plan is based

100. Why is such a plan needed?

Answer. In an economy of abundance, the prime requisite is a sustained market. In other words, business needs sufficient customers. Mass production requires mass consumption. The primary market for our production lies in the hands of wage-earners and other in the smaller income groups, and the total market for all goods (both consumers' and producers' goods) depends on sustaining this primary demand.

The purchasing power of this primary market depends upon sustained employment of those who compose it. Any condition, no matter what the factors bringing it about, which throws numbers of this group out of work immediately cuts the basic purchasing power upon which our economy as a whole depends.

Without some corrective device which will become effective rapidly and automatically the moment any condition arises which tends to cut the buying power of this primary market, a deflationary movement is initiated which soon becomes a "downward spiral."

This plan would provide an automatic resistance line against such a deflationary movement. This resistance line would be set mathematically at the highest average level of wealth production we had been able to attain over a long period. Because this index would be a moving average, it would reflect our constantly improving ability to produce which results from scientific and technological progress. Without such a resistance line, we are bound to have recurrent periods of severe depression during which we destroy or waste the wealth that has been created during the past periods of general employment and prosperity.

101. Will it be needed when we are once out of this depression?

Answer. Yes. Every phase of economic development is a matter of cause and effect. We must have, as a part of our control mechanism, a balancing device that will correct adverse trends the moment they are initiated. We must dampen the "booms" as well as minimize the depressions if we are to secure the greatest benefits from our economic development and avoid the misery and destruction which depressions entail.

102. What is the fundamental premise on which the plan is based?

Answer. It rests on the premise that the unfilled desires of the masses of the people for the material satisfaction of life are practically limitless and that in spite of our great technological advance it is still possible for our people to work reasonable hours if we find the means of economically distributing the production of their labor. The only way that production can be sustained is by sustaining consumption. Under this proposal, the Government would simply provide the mechanism for sustaining consumption at a high level at all times, and the mechanism itself would provide for the necessary distribution of such production.

103. How can such a simple device cure depression?

Answer. Depression is not a visitation from on high. Depression is the result of numerous factors in our economy which get out of balance by reason of our imperfect knowledge and control over the mass actions of human beings, each going his own way without regard to the effect of his acts on our economy as a whole.

Assume you have an oil well and wish to produce the largest volume of oil possible. You must divert part of the oil to run the fires which supply the steam for the pumps which extract the oil from the well. You would divert sufficient oil to keep the pumps going at maximum capacity. The amount of oil you must divert is not important. It does not decrease your production of oil. If for any reason the fires slowed down, it would be to your interest immediately to divert additional oil to keep up the maximum head of steam. Only in this way would you be assured of pumping the maximum oil from the well.

It is the same with purchasing power in the hands of our primary market. To keep the industrial pumps going at maximum capacity, sufficient purchasing power must be diverted to assure maximum wealth production. Depression comes from lack of sufficient fuel (primary purchasing power) to keep up a sufficient head of steam to insure maximum production. And the simple corrective for depression is to divert as much fuel (purchasing power) as is needed to keep the steam gage up. Its diversion, whatever the amount, does not decrease wealth, as only by its diversion can the greatest volume of wealth production be secured.

104. Will this plan cure all our troubles?

Answer. Certainly not. This plan is not designed as a cure-all. It is highly desirable that we continue our research to discover the weaknesses in any and all devices which we use to control our economic life. Through the controversy which constantly rages as to the propriety of our present monetary system, the fairness and effectiveness of our tax system, the relative benefits of a large or restricted foreign trade, the arbitrary control of production, private or Government ownership of monopolistic enterprises and other phases of our economic life, we should be able to gradually perfect our systems and technic so that we are not thrown into a tail-spin periodically as we have been in the past.

The only purpose of perfecting these several devices, however, is to assure the greatest continuity of material and social well-being that human society is able to attain.

This plan is conceived as a safety device on our economic machine which would cushion a fall and keep the passengers from being mutilated or killed if, for any reason whatever, the machine gets loose and starts on a downward plunge due to our failure to have perfected the various functioning parts of the mechanism so that it will operate efficiently under all possible conditions.

If, as the result of research, or trial and error, we are able to reach the point where human beings cease making mistakes, perhaps such a safety device will not be needed, but that is no argument for not having it there should the need arise. It is generally agreed that stable markets and universal employment are the primary objectives of our economic life and this plan would accomplish these two vital results. Once having attained these results the problem of perfecting the various instruments which we use to conduct our economy should be greatly simplified.

105. Isn't it logical to assume that proper management planning might, in many industries, stabilize production?

Answer. It would help, and provided a sufficient number of industries cooperated could conceivably cause a high degree of balance in our industrial life. However, production cannot proceed without sufficient effective purchasing power to absorb the goods produced. The problem, therefore, is to sustain adequate effective purchasing power. As no industry sells its products to its own employees, an increased distribution of purchasing power by that industry to its own employees can be only partially and indirectly effective.

The only sure way to accomplish the desired result is to increase the total effective purchasing power of the mass consumers of the Nation, whenever such purchasing power is found to be insufficient to call for a continuation of production, up to the point of

total desire for any given product. This must be accomplished by concerted action throughout the Nation, as is provided for in this plan.

106. Does work-sharing increase the total dollars of purchasing power, or does it simply give more purchasing power to those who would otherwise work short hours or not at all, at the expense of those presently employed for long hours?

Answer. Spreading work only would not increase the total purchasing power of the Nation. That is why work sharing in itself (which is a part of the plan) is inadequate to meet the problem and why there must be provided simultaneously some automatic method of sustaining a high level of production and employment, as is provided for in the other parts of the plan. Although work sharing in itself does not increase total purchasing power, it has a vital effect on the economy as a whole. Fear, loss of confidence, is one of the most potent factors in a deflationary movement. Throwing a worker out of a job completely, which generally means cutting off his sole source of income, not only creates almost a panic condition, at least where it is problematical if another job can be found, but creates in the minds of his fellow workers the fear of losing their jobs, which slows up their expenditures. The effect is much more severe than where the worker knows he will keep a job even if he suffers a small reduction of income.

But perhaps the worst effect of all is that unemployment means a labor surplus and, if it persists, puts the unemployed in competition with all those who remain unemployed, deflates wages and primary purchasing power.

Work sharing is an important element, therefore, in maintaining purchasing power, particularly when it is linked simultaneously, as it should be, with some method of sustaining the total work to be shared.

The two elements of the problem must work together as provided for in this plan. If we fail to sustain a high volume of employment hours, reflecting a high level of wealth production, then even its equal distribution will not yield an adequate standard of living. If we fail to attain an equitable distribution or sharing of what work there is, then, even though the volume of production is high, some will profit at the expense of others and we will still have unemployment with its deflationary influence.

107. How is it possible to completely eliminate involuntary unemployment?

Answer. By first inducing the widest practicable work-sharing and then hiring those who still are unable to find private employment on preplanned public work.

108. How is it possible to guarantee a high level of production?

Answer. By immediately and automatically increasing effective purchasing power (demand) the moment it becomes inadequate to sustain a high level of wealth production. We would know that it was inadequate whenever employment hours (representing current production) fell off. At such times the corrective action of the proposal would become effective immediately, thus creating a net increase in effective purchasing power.

109. Are employment-hours a proper measurement of production?

Answer. Man-hours are a reflection of production only at any given moment. However, labor (both brain and brawn) is the primary constituent of production. Therefore, man-hours is the only basic index of prosperity for the whole people. By weighting such an index for changes in production per man-hour, it becomes a highly accurate measuring stick of the level of wealth production.

110. How many hours per week should a man work?

Answer. The number of hours he wants to work in order to secure the things he is willing to work for.

In other words, such a question cannot be answered in terms of X number of hours per week. That is why the limiting of employment to 30 hours per week or some other arbitrary figure is simply a means of attempting to attain greater equity in the distribution of an inadequate volume of wealth production, instead of increasing the volume of wealth production sufficiently to permit the economic distribution of the total production of all goods and services, up to the point of desire for any given product or service.

111. Will the plan tend to eliminate the violent ups and downs in the business cycle?

Answer. Yes, that is a primary characteristic of the plan.

112. Isn't it socialism?

Answer. On the contrary, the plan is based on the premise that the profit system should be maintained because it best serves the mass of the people, provided it operates to give each individual free access to such part of the total production of the Nation as is commensurate with the contribution he is able to make.

113. How much should a man receive for his labor?

Answer. As much as he can demand in competition with the labor of others.

Provided we find a means of sustaining our wealth production at the highest average level permitted by our scientific and technological knowledge, this would compensate each individual on the basis of relative ability and efficiency and provide a living income for the least efficient.

However, if we continue to fail in adopting some automatic governor on our economy, such as would be provided by the adoption of this plan, the matter of individual compensation probably will continue to be a matter of conflict between employer and employee. This proposal, therefore, would lead to harmony and cooperation and eliminate much of the bitterness and strife present in the functioning of our economic system today.

114. Will it retain the profit incentive in business?

Answer. Yes. Just as at present.

115. Isn't this a scheme to redistribute wealth?

Answer. Not to redistribute wealth, but a scheme to assure that correct distribution of spending which is economically required to sustain a high level of wealth production.

116. Isn't the essential purpose of the plan to bring about a common leveling of all hours and wages?

Answer. Certainly not. The plan does not control wages in any way. Wage rates would be determined just as they are today. Neither does it control the number of hours an employer uses. This he would determine just as he does today. The only control would be the inducement exerted in favor of the distribution of work so as to avoid greatly excess average hours by a given employer. Undoubtedly there would be a tendency for average weekly hours per worker to stabilize, but this action would tend to increase the total number of man-hours used, which means increased production.

117. Can any unemployment reserve plan cope effectively with the type of unemployment which we have experienced during this depression? Would it be adequate to meet such a decline in employment and business activity as has accompanied the basic change in the price level which characterizes this depression?

Answer. If such a plan was made part of our control mechanism, it would avoid such conditions as we have experienced during this depression—that is its purpose. Prices drop when supply exceeds demand. This plan would create a condition raising effective demand above current supply the moment a downward trend started, no matter what the cause of such trend. The effect would be to reverse any such trend of decreasing prices as soon as the trend started. Likewise, if prices rose too rapidly, for any reason whatever it would cause an overstimulation of business activity, which would cause the monthly average to rise above the long-time average, and this would cause employers to pay taxes into the reserve fund. The cost of such taxes would increase prices and thus further dampen purchasing power, which would reduce effective demand. This would act as a check on the too rapid expansion and tend to correct the condition. There is nothing that would be more effective in eliminating violent fluctuation in the price level than stabilizing effective demand and supply, and this plan would do just that.

118. Would the reserves built up for the payment of supplemental compensation ever prove inadequate? If so, how would the necessary funds be accumulated?

Answer. No. The accumulation of funds sufficient to pay the requirements for supplemental compensation would be assured over a period because of the mathematical characteristics of the law of averages. That is, the long-time average, being corrected at the first of each year to reflect the trend, becomes a moving average with the number of hours above the average and the number below the average equaling each other over a long period. As the tax assessed for hours above the average is at a higher rate than the supplemental compensation paid for hours below the average, it is certain that the amount collected would, over a period, be considerably in excess of the amount disbursed for supplemental compensation. This excess would be sufficient to pay the wages of those given employment on public work. The reserve fund becomes, therefore, a self-liquidating, revolving fund with no danger of its ever being inadequate, over a period, to cover the requirements, whatever they may be. This mathematical characteristic is a vital element in the plan and should be kept clearly in mind.

119. Would it be necessary to regulate the general price level which, in turn, is dependent fundamentally upon the cost of labor, in order to prevent excessive drift toward expansion or contraction in the amount of credit used for control?

Answer. Aside from purely arbitrary actions, generally political, the price level reflects current or anticipated supply and demand. In other words, changes in the price level are in themselves corrective. As demand falls in relation to supply, prices fall. As demand increases in relation to supply, prices increase. Because this plan would tend to keep demand in balance with supply, it should keep prices stable. Falling prices, denoting a deflationary movement, would be corrected through the payment of supplemental compensation under the plan. The result would be a rapid correction in falling prices.

The reverse would be true as the reserve fund accumulated—prices would rise as costs, reflecting the tax, rose. Therefore any arbitrary control of the general price level would be unnecessary and undesirable.

120. Might it not be possible, in the absence of centralized planning, that the supplemental compensation suggested by you would be responsible for a fictitious demand which would reflect itself in larger portions of the national income going into producers' goods?

Answer. No. For the first time in our history we would have accurate current statistics of effective purchasing power for consumers' goods. This would make it possible to more accurately judge demand and reduce the danger of misjudging the future requirements for producers' goods. Anything that would eliminate the violent fluctuations of supply and demand would have a general stabilizing effect. This plan would tend in that direction. One of the main features of the plan is that if periodic over-investment still occurred, as it undoubtedly would, the deflationary results of its cessation immediately would be checked and a sufficient net increase in consumer purchasing power over current production

would be added to keep the total national employment and production from falling.

121. Won't prices go up as much as wages?

Answer. When current employment was below the long-time average, prices would not go up because the supplemental compensation used to increase the worker's income would not come out of the employer's pocket and therefore would not increase his costs. When current employment rose above the long-time average and all employers paid overtime, it would increase costs and probably would be added to price. This would be the result desired at such times, as it would reduce effective purchasing power and dampen the trend toward overexpansion.

122. Won't technological progress wreck the plan by gradually reducing man-hours required to turn out a given production?

Answer. No. It would have nothing to do with the plan. The plan itself makes a mathematical correction for any such trend, as explained in the answer to question 161.

But a realistic analysis of the bugaboo of technological unemployment shows it to be fantastic in the first place, and in the second, granting proper distribution of the products of industry so as to sustain effective purchasing power, technological advance should mean a higher and higher standard of living, not fewer hours of work nor unemployment.

The conclusions recently reached by the Brookings Institution on this point are interesting. The following is quoted from chapter XI (pp. 126–131) of America's Capacity to Consume, published by that institution in September 1934:

1. During the so-called new era of the gay twenties the United States was not living beyond its means.

2. There has been a tendency, at least during the last decade or so, for the inequality in the distribution of income to be accentuated.

3. Vast potential demands alike for basic commodities and for conventional necessities exist in the unfulfilled wants of the masses of the people, both rural and urban.

4. The United States has not reached a stage of economic development in which it is possible to produce more than the American people as a whole would like to consume.

5. We cannot materially shorten the working day and still produce the quantity of goods and services which the American people aspire to consume.

6. In emphasizing the need of increasing consumption, we must not forget the necessity of simultaneously expanding production.

123. Isn't the plan comparable to the English dole and wouldn't the effect of this plan be the same as that of the dole?

Answer. In no sense of the word. In fact it is just the opposite. The dole recognizes unemployment and attempts to minimize the burden on the worker. This plan guarantees the worker a job at all times. It further holds business up by sustaining demand and thus causes a high level of employment in industry.

124. How would the plan affect the bargaining power of labor?

Answer. It places the least possible compulsion on employees and employers. It does not set up rules or regulations as to production, wages, terms of employment, etc. The bargaining power of labor and of employers would remain unimpaired. By keeping all workers employed and production at a high level, the demand for labor, of itself, would maintain the buying power of wages at a high level. Labor would still bargain for basic-wage rates and working conditions. The plan itself simply would induce an equitable distribution of the hours necessary to produce the goods which the sustained purchasing power of the Nation would demand.

125. Why do you suggest weekly hours of employment as an index?

Answer. Whenever effective purchasing power becomes inadequate, production falls off. We naturally stop production when we cannot exchange it for something of sufficient value to compensate us for our continued expenditure of energy. When production falls off, hours of employment fall off. An involuntary reduction in hours of employment, therefore, is an indication of falling production, not necessarily reduced units of production, but of a reduced rate of production in reference to the rate that could be profitably maintained if those who want more goods and services had sufficient purchasing power to induce their transfer.

That is why weekly hours of employment are used as an index and why, whenever this index drops below the point at which we want employment sustained (the average long-time level), the plan would increase the effective purchasing power in the hands of those who want the goods and services which an increased production would supply.

126. How would you define purchasing power?

Answer. As the power to induce a voluntary transfer of goods or services for other goods or services. As money is the universal medium for facilitating such transfers, then to whatever extent it is a necessary mechanism, money is purchasing power.

127. When would you say that purchasing power is inadequate?

Answer. Whenever for any reason whatsoever the amount in the hands of those who want more goods or services is insufficient to cause the transfer of the total profitable production of such goods and services.

128. Why do you suggest the use of a long-time average computed as proposed in the plan?

Answer. Because it represents the highest average level of employment we have been able to maintain under the system and methods and knowledge which have resulted from the evolution and growth of our industrial and scientific processes. By using a moving long-time average it takes, as a point of departure, the longest average weekly hours that have been used during the period, either because it was all the hours the workers wanted to work or, more accurately, all the hours they were permitted to work under the economic system (including the money mechanism) under which they were employed.

129. Is there any necessity for wage control?

Answer. No, other than that occasioned by the law of supply and demand, because this plan provides a mechanism which sustains demand adequate to sustain continuous production. In other words, any stability given to the level of production would reflect itself in the stability of wages. Changes in wage levels are generally occasioned by more or less violent changes in demand for labor. By keeping the labor surplus off the market and pegging the wages of labor on public work at a living wage, the bargaining power of labor would be improved because of such sustained demand. And the income of the mass of the workers would be sustained at whatever level was necessary to sustain production.

130. Why doesn't the employee contribute?

Answer. For several reasons. The purpose of requiring a tax to be paid for hours in excess of the long-time average is, first, to induce reasonable work distribution when conditions are below "normal," that is, when the monthly average is below the long-time average. Except in rare cases the employee does not decide how many hours he shall work. In other words, the number of hours which the plant or office operates lies within the discretion of the employer and he always has the power under this plan to avoid the payment of a tax for hours above the long-time average by conforming his weekly hours to such average. Therefore, such tax payments are designed to provide a sufficient saving in costs by work distribution to cause a choice to be made by the employer in favor of work distribution rather than the payment of the tax.

So far as the payment of the tax when conditions are above "normal" is concerned, that is, when the monthly average is above the long-time average, such taxes would fall as a proportionate increase in the payroll of all employers alike, so that their competitive position would remain unchanged.

It is fair to assume that at such times (only when production and employment are at a high level) the additional cost to the employer would be added into the price of his products. To the extent that this was done the effect would be to reduce the real purchasing power of consumers. This would be desirable at such times, in that it would dampen a too-rapid business expansion.

131. How would the plan operate to adjust for the effects of technological advance?

Answer. To the extent that technological advance lowered hours by increasing production per man-hour, it would lower the monthly averages and immediately induce the absorption of those who otherwise would be unemployed, or failing to be absorbed, they would be given Government work. At all events, purchasing power would be sustained adequately to take the total production of the Nation up to the point of maximum desire for any given product. The plan provides for the necessary weighting of the long-time averages to correct for any downward trend of average hours caused by increasing production per man-hour. There is no reason to assume that technological advance must bring a lowering of average hours. So long as the desires of the mass of our people are unfilled, it is more logical that technological advance should increase the standard of living by properly distributing the increased production, rather than decrease average man-hours of employment.

Once the standard of living is raised to the point where people choose more leisure rather than more material satisfactions, then average hours should go down. So far as the operation of the plan is concerned, it makes no difference which they choose. It would tend to keep our economy in balance under whatever conditions of efficiency pertained. It would have a tendency, however, to eliminate waste and the recurrent destruction of values which take place periodically under our present system and to accelerate the rise in the general standard of living.

132. Won't it cause overproduction?

Answer. There isn't such a thing as overproduction, except in a given commodity, so long as the total desires of our people for the goods produced remain unsatisfied. What we call overproduction is generally under-consumption. If saturation of the total desires of all our people, for which they are willing to work, ever arrives, it will simply bring a gradual reduction of average working hours, nothing else.

133. Won't it cause over-saving?

Answer. It might have that tendency. But if it did, all that would result would be a gradual reduction of yield on investments, with increased safety.

134. How would it affect foreign trade?

Answer. See answer to question 150.

135. How would it affect prices?

Answer. See answer to Question 119.

136. How would it affect the value of securities?

Answer. It would sustain the value of investments by sustaining the earning power of the property of which they represent ownership.

137. How would it affect property values?

Answer. See answer to Question 136.

138. How would it affect employment in capital-goods industries?

Answer. A large share of the present unemployment arises through the decrease of production in the capital goods industries, both producers' goods and durable or long-time consumers' goods.

Production of capital goods depends on two factors: (a) Producers' goods—upon actual or anticipated consuming power sufficient to justify their profitable use and thus validate the investment therein, and (b) long-time consumers' goods—upon actual or anticipated consuming power sufficient to absorb the volume produced.

All types of capital goods generally call for the extension of credit and in the case of producers' goods, generally long-time credit. Credit in turn is available through customary investment channels only when confidence exists that adequate consumers' purchasing power will be available over the term of the credit to insure the service thereon and to amortize the loan on or before its final maturity.

This proposal, therefore, would provide the most solid basis for a return of the necessary confidence by insuring not only an immediate increase in consuming power sufficient to justify investment in new capital goods but assurance of such an adequate consuming power permanently sustained.

While there is no justification for the production of producers' goods on any basis other than a reasonable assurance of their profitable use or sale, it is certain that prosperity inevitably will return and that, therefore, there exists today actual justification for the immediate production of large quantities of such goods. And the certainty of an assured and permanent consuming power should go a long way to induce an immediate increase in such production, although there is nothing in the proposal to mitigate against the use of any other measures designed to accelerate the movement.

139. If the long-time average was reduced each year while a depression lasted, is it not true that this would reduce the payments of supplemental compensation?

Answer. There would always be a lag in the reduction of the long-time average compared with a drop in the monthly average. Therefore, the deeper a deflationary movement went, the greater would be the differential in favor of demand (represented by effective purchasing power) over supply (represented by current production). This is one of the main characteristics of the plan. The amount of purchasing power in dollars at any given time is unimportant. What is important is the dollar volume of purchasing power in reference to the dollar volume of current production—in other words, the level of demand compared with the level of supply—and the plan would operate on any down-swing to increase the pull of demand over supply. The deeper the down-swing became, the stronger this pull would become, until at some point the attempt of supply to meet the excess demand thus produced would cause a reversal of the trend. This pull would become effective immediately and automatically the moment weekly hours of employment, for any reason whatsoever, brought the monthly average below the long-time average, and the corrective action would continue until the balance was restored.

As an illustration of the importance of promptness in exerting such corrective action, let us assume that we have a pole standing perpendicular and that it starts to lean off center. It takes very little force to push it back, provided the force is exerted immediately it starts to lean. But once let it get seriously off center and the force required to push it back goes up in geometric ratio. If we start the necessary corrective action by supplementing purchasing power the moment it becomes inadequate to sustain production, the force required (that is, the amount of money required) to push it back will be relatively small.

140. Isn't the plan too complicated for practical operation?

Answer. It is not complicated. Actually, its operation would be quite simple. The averages would be easily determined by a simple calculation from reports made monthly by employers. These reports would contain only simple data consisting of the number of man-hours used during the period reported and the number of employees on the last day of each period reported. Every employer keeps such figures now or could easily do so. The operation of the Government employment offices would not be complicated.

Because it does not attempt to control production, wages, prices, or hours, its enforcement as a tax measure would be relatively simple.

141. Is it likely that this plan would eventually force the Government to take over and run all industry?

Answer. Not at all. On the contrary, it would bring about a condition of general security for the workers and a high level of sustained production and business activity for employers. Industry would thus be keeping its own house in order and there would be no reason for Government to intervene in order to meet emergencies occasioned by millions of people being thrown out of work and a general destruction of investments and profits. (See question 144.)

General effect of the plan on the national well-being

142. What social advantages would flow from the plan?

Answer. Economic welfare and social welfare are synonymous. By maintaining economic health it would safeguard social health. It would provide permanent security to both the worker and the employer. It would guarantee a job to everyone. It would guarantee a sustained market for the products of all industry.

Increased economic well-being would permit children to secure better schooling and more of it.

It would reduce crime by giving everyone the discipline of self-respecting work.

143. What, if any, would be the effect on the standard of living generally?

Answer. Obviously, it would tend to raise our standard of living to the highest average level permitted by our ability to produce. By maintaining effective purchasing power or demand for goods at a level adequate to call for production up to the limit of desire for any given product, the highest possible level of wealth production would be sustained. As the material standard of living increased, it would bring with it increased opportunity for more leisure and permit of a higher degree of cultural development.

144. Doesn't the plan put Government in business and therefore prove an objection?

Answer. It does not put Government in business. All the Government would do is to create the mechanism under which industry and labor would run their own show. The averages upon which the plan operates would not be set by the Government, but would be determined from actual figures provided by industry itself. The plan would be operated by industry and labor and simply would be implemented by Government in order that it would operate on a uniform basis and preserve the equities of every participant. (See question 141.)

145. Why do only part of the people receive the benefits?

Answer. Everyone in the Nation who can benefit from sustained business will benefit. It is not necessary to include everyone under the plan itself. If the major portion of the spending power of the Nation was included, as it would be, the sustained purchasing power of that primary group would sustain the income of the balance of the Nation, which depends upon the expenditures of those in such primary group.

146. Will agricultural workers or those in personal service be eligible under your plan?

Answer. They could be included the same as other employees. But it may not be desirable to do so because of the difficulty of regulating their hours. Their exclusion, however, would not adversely affect the results of the plan. As the greatest portion of the total primary market is included, the operation of the plan would have the desired effect on the total economy of the Nation. For instance, it is not necessary to directly increase the income of our doctors if the income of their patients is sustained, but the income of the patients would be sustained only indirectly by increasing the expenditures of the doctors. Likewise with agriculture. If the buying power of industrial workers, which represents the largest share of the total market for all kinds of goods and services, is sustained, they will purchase the products of agriculture up to the point of desire and thus sustain the market for farm products and the incomes of farmers. Also sustained industrial production at a high level will increase the average income of those in industry and thus attract the marginal worker from the farms into industry with a secured future. This will decrease the number engaged in agriculture and increase the incomes of those who remain in agriculture.

147. Won't it stifle individual initiative?

Answer. No. Opportunity to work for a reward doesn't stifle industry; it promotes it.

148. Who foots the bill?

Answer. No individual or group of individuals. Industry gets the benefit at one period of the business cycle and pays it back out of the wealth produced at another time. It is like any other reserve fund, it simply sets aside a portion of the total production when production is high, and uses it to sustain demand when production otherwise would be low. This sustains profits for both the employee and the employer.

149. What would it cost the Government to maintain the plan?

Answer. The only cost to the Government would be the initial capital of the National Employment Reserve Corporation of $500,000,000. This corporation would be given the power to borrow for its needs. While the Government would guarantee the obligations of the corporation just as it does with the R. F. C., such guarantee would not constitute a drain on the National Treasury by reason of the assured income of the corporation due to the mathematical characteristics of the plan because the taxes assessed would constitute a premium income always sufficient to cover the demands upon the corporation.

The plan is essentially a device supported and operated by industry and implemented by Government to insure uniformity and to preserve the equities between all those who contribute and benefit.

150. The United States is not a complete economic unit. How would this plan control foreign trade and migration? Wouldn't a decline in foreign purchases of cotton or wheat seriously disturb the plan?

Answer. Foreign trade would not affect the operation of the plan, except in one respect, for which the plan would help make an automatic adjustment. In the final analysis, our foreign trade must balance in terms of goods and/or services. We want the largest possible volume of foreign trade, provided it does so balance. The way to insure the largest volume of foreign trade is to increase the purchasing power of our people at home so that their demand for the products which we do not produce—because we are not a complete economic unit—for instance, rubber, manganese, tin, coffee, certain luxuries, and so forth, will provide the dollar exchange for an equal volume of exports.

It is obvious that a decline in foreign purchases of cotton or wheat, or any other unbalancing of the normal export volume of

individual products, will affect the workers in that particular industry, just as the changing styles often adversely affect domestic industries. Today we have no device for meeting a situation where plants shut down as the result of such influences and throw men out of work, thus reducing the buying power of the Nation. Only by sustaining such buying power can we meet a situation where men must be transferred from one line of work to another. The plan does not change the situations we must meet, but it does provide an automatic device for meeting them and sustains the buying power of the Nation while we are doing so.

151. The plan provides that no money would be paid to idle workers, since all would be employed under it, though at a minimum pay. While this distinction may have some moral validity among those who are against doles, is there any real difference in the economic effect between these two measures?

Answer. No. But no one who is familiar with the effects of welfare and relief work can doubt the social value in a democracy of providing self-respecting work versus a money dole.

152. Would not the natural tendency under your proposal be almost monopolistic, in that prosperous companies in an industry might enlarge their productive capacity to enable them to produce the same tonnage with shorter hours, and to give them a more flexible set-up?

Answer. There is nothing in the proposal that affects the number of man-hours of labor which an employer uses. If the actual man-hours used were divided among a greater number of employees, then the investment in equipment per employee would be reduced, but the investment per man-hour would be no different than it was before. The situation as to equipment would be exactly as it would be as to employees. A company probably would use its equipment fewer hours per machine when business fell off, just as by work distribution it would use its labor fewer hours per employee.

153. Will the plan actually eliminate unemployment?

Answer. It will completely and permanently eliminate involuntary unemployment of those capable of working. Whenever a worker cannot get a job in private enterprise, he will be given a job by the Government on preplanned work. The only involuntary unemployment would be during the 30 days after losing a position, before actual employment on preplanned work would be made available.

154. How could the present large number of unemployed be absorbed without disrupting industry?

Answer. The answer is very simple. Suppose the country knew, without the shadow of a doubt, that the effective purchasing power of the mass of the people would be increased by roughly 10 percent 90 days from now; that such increase would bring effective demand above our current rate of production and that such assured demand would remain above current supply until production and employment again rose to the long-time average. It is obvious that producers would increase employment immediately in order to produce goods to meet such an assured demand. This would cause the reemployment of many of our present unemployed even before the plan became officially effective at the end of the 90-day period. There would be no danger of overproduction except perhaps in given articles. In fact, the only way sufficient production could be produced to meet the assured demand would be to increase employment to the long-time average. Ask any producer what he would do if he were given absolute assurance of such a demand.

By reason of present reduced employment that is exactly the situation that would be created. The only factor that would hold back full employment would be the inability of industry to increase production rapidly enough to meet the assured demand.

155. What would be done under the plan to give work to workers thrown out of employment by an obsolescent or dying industry?

Answer. Workers thrown out of employment by a dying industry would be able to find employment in other industries because the total market for the goods of other industries would be increased by an amount representing the purchasing power which formerly purchased the products of the dying industry, thus causing an increased demand for labor in such industries. If displaced workers did not find new employment in private industry immediately, they would be given work on Government projects. This would reduce the monthly average and automatically bring into play the inducement for work distribution inherent in the plan, and provided the monthly average fell below the long-time average, the payment of supplemental compensation. This would shortly exert its pull to draw the efficient workers back out of Government work into private employment.

156. How would an industry be handled, such as printing and lithographing, where it is necessary to sell the goods first at a contract price and then make them to order afterward.

Answer. Because it doesn't control wages or man-hours used, there would be no necessity of any special action to meet such a situation as is pictured. If the price quoted was based on the required number of man-hours at a predetermined wage rate, then the plan would not affect the situation in any way.

157. Will it tend to avoid the dangers of over-production by enabling a better judging of the potential market?

Answer. Yes, it would eliminate violent fluctuations in demand by sustaining effective purchasing power at all times.

158. Will it stabilize earnings, and therefore values, of equity stocks?

Answer. Decidedly; because it would sustain effective purchasing power for all goods and services.

159. Would the plan give us current statistics as to economic conditions?

Answer. Yes; immediately after the close of each month we would know—and the information would be available to the public—how many workers were currently employed by each industry, the total man-hours they were employed the previous month, the number of workers unemployed in "private" industry, the number employed and the man-hours used on Government preplanned work.

160. Will not there be a tendency under the plan for workers in agriculture to move into industry?

Answer. Decidedly. That is the best thing that could happen, provided permanent security is provided for the industrial worker as it would be under this proposal. The expansion of industry, producing the desires of the people, is practically unlimited and nothing could be more beneficial to our economy, as a whole, than to transfer those workers on the farm who are able to live only on a subsistence basis to industry, producing the things they need and desire for a higher standard of living.

Mathematical basis of the plan

161. The plan proposes to mathematically correct the long-time average to weight for the effects of increasing production per man-hour caused by technological advance—is this possible?

Answer. Yes. This would be accomplished by calculating the rate of increase or decrease in the trend, from which a statistical correction would be made in determining the official long-time average. This is necessary because the long-time average is a projection of what is expected to happen the following year, based on what has happened over the past 10 years. It is impossible, of course, to make a completely accurate projection, but by weighting the projection for the trend, and correcting at the beginning of each year, a complete correction is made in the moving average with only a slight time lag. The only effect of this lag would be to determine the time over which the supplemental compensation expended in a given period would be reimbursed. And the period is of no moment. The actual balancing of income and outgo over a period is mathematically certain.

162. Under this plan, would the standard used for the long-time average be the predepression employment condition of the country?

Answer. No. The standard represented by the long-time average would represent the highest long-time moving average of weekly hours of employment which had actually been used during the period averaged, either because it was all the hours the workers wanted to work or all the hours they were permitted to work under the system and standards of efficiency that the Nation had been able to create. It would represent neither the boom periods nor the depression periods, but the average of both periods.

The monthly average would be accurate from the start, as it would be calculated from actual reports of employers received at the close of each month.

163. How do we know the money used to pay supplemental compensation will be paid back?

Answer. Because of the mathematical characteristics of the plan. Working from an average of weekly hours, we know that over a period the number of hours above the average will exactly equal the number of hours below the average—or it wouldn't be an average. As a tax would be assessed for excess hours at a higher rate than supplemental compensation would be paid for deficit hours, the amount collected would always exceed, with mathematical certainty, the amount expended. This excess would be used to pay the wages of those given employment on preplanned public works.

Application of the plan in respect to its effect on the employee

164. Would every worker be able to secure the benefits of the plan?

Answer. Yes, if you are employed, by an individual, company, corporation, association, or other employer, or if you are unemployed and register for employment with the Government agency charged with providing preplanned public work.

165. What benefits would the employee secure?

Answer. You would be guaranteed a job on Government work if unable to secure a job in private enterprise. Also, you would be guaranteed additional compensation, in addition to that received from your employer, out of a national reserve fund whenever employment fell off, that is, when the monthly average dropped below the long-time average. Such payments would continue until current employment rose again as high or higher than the long-time average.

166. What would the employee have to contribute?

Answer. Nothing.

167. Does the employee pay any dues or fees of any kind?

Answer. No.

168. What happens when I lose my job?

Answer. You register with your local Government employment office and then try to get another job with or without their help. If you are not successful within 30 days of the date you registered, you would be given a job by the Government. The job given you might not be the same class of work you had been doing, but it would be work you were capable of performing. The pay on such a job would be on a minimum standard.

169. Where would I apply for work?

Answer. To your local Government employment office.

170. Do I receive benefits while I am unemployed?

Answer. You do not receive any supplemental pay unless you accept a job which the Government guarantees to furnish you.

171. If my work-hours were reduced, how would it affect my pay?

Answer. If you are paid by the hour your wages would be less because of the reduced work. But whenever the monthly average was less than the long-time average, you would receive from the national reserve fund additional compensation over and above that received from your employer, which would keep your total income from falling greatly.

172. How would I know when I was entitled to receive benefits from the reserve fund?

Answer. You would know what both the monthly and long-time averages were, as these would be published in the daily papers, posted in your shop or office, and at your local Government employment office and post office at all times.

173. For how long would I receive benefits in the form of supplemental pay?

Answer. Such payments would continue so long as the monthly average remained below the long-time average.

174. In what form would I receive the benefits?

Answer. They would be paid to you each day by your employer along with your regular pay. Your employer would get the money back immediately from the national reserve fund.

175. How will the plan affect my wages?

Answer. It does not affect your regular wages in any way, except that it guarantees you supplemental compensation as explained under question 171.

176. Would the adoption of the plan tend to reduce wages?

Answer. No. Wages tend to go down only when demand for labor is weak. By sustaining a high level of purchasing power, the demand for goods would be sustained. This would sustain employment and cause a stable demand for labor and thus tend to maintain wage rates.

177. If I lose my job, how long must I wait before I get another job?

Answer. You could get another job in industry just as soon as you could find one. Because business would be kept up, your chances of finding another job immediately would be good, but if you were unable to find a regular job, you always would be given a job by the Government employment office after a lapse of 30 days. So that if you registered immediately after you lost a job, you would never be out of work for more than 30 days.

178. Do I have to take any job offered me?

Answer. No. But if you want a job provided by the Government you must accept the kind of work it is able to provide.

179. How much will they pay me if I accept a Government job under this plan?

Answer. Such work will be paid for on the basis of minimum wages, set to provide a subsistence living.

180. Might it not be difficult to persuade unemployed workers to accept low pay on preplanned work supplied by the Government?

Answer. The plan would sustain production and employment at the highest average long-time level. This would sustain demand for labor at all times and thus involuntary unemployment in private enterprise would be kept at a minimum. Hence the number given employment on preplanned work supplied through the Government would be relatively few and these would consist of the most inefficient marginal workers. The better working class would be able to secure regular work. With the plan in effect, it is logical to assume that charity organizations would refuse to support such marginal workers if they knew they could support themselves on public work, and although the pay they would get would be small, it would provide decent subsistence and would still be more than such workers could get from any charitable organization. Therefore there is no inherent weakness in keeping the wages on public work at a minimum. There is an advantage in doing so, in that those who are forced to work in order to support themselves would be induced to seek employment in private industry as soon as possible in order to get higher compensation. In other words, there would be no inducement for men to stay on public work rather than to get back into private productive enterprise.

181. What would be the effect of the plan on the employment of women?

Answer. It should tend to reduce the number employed particularly in factory work a great portion of whom now work in order to supplement the family income. If employment was regularized and our production more evenly distributed—as it would be automatically under the plan—it would make it unnecessary for a great many women now employed to continue to work.

It is probable that as our standard of living increased as it would if our production were sustained at the highest-average long-time level and economically distributed there would be a tendency on the one hand to accelerate the reduction in the hours of work required in the home which might cause more women to seek outside employment. But on the other hand by increasing the standard of living such a tendency should be offset by those who would give up outside employment and devote their time to the promotion of cultural interests. Statistics show that marriage rates increase with regularized employment which should have a tendency to remove a percentage of the present unmarried women from unemployment in industry.

182. By inducing work-sharing, would not the tendency be to lower the average efficiency of the workers and increase costs?

Answer. Any decreased efficiency which might result for a given employer through work sharing would be more than offset by the increased efficiency of the Nation as a whole through greater employment. It is self-evident that the total production of the Nation is increased when all workers are gainfully employed up to their full capacity and receive a sufficient income to permit of the adequate purchase of such production. Any employer profits by having a sustained market for his goods much more than from slightly increased efficiency which may enable him to get a larger share of a smaller market. Whatever the effect might be, if any, on efficiency, such effect would be spread over all industry and not centered in one plant. Every employer would remain in the same position as today in bidding for the most efficient labor against his competition and would have the same opportunity as today to develop the relative efficiency of his own plant or business.

Application of the plan in respect to its effect on the employer

183. Are all employers eligible to operate under the plan?

Answer. Yes; except those engaged in agriculture.

184. Must an employer operate under the plan?

Answer. Yes. If you have one or more employees receiving salary, wages, commissions, piecework, or other compensation, except agricultural employees.

185. What benefits would the employer receive from the plan?

Answer. You would be assured sustained buying power throughout the Nation among those to whom you sell your products or services. In effect you would have market insurance.

186. Does the plan control the number of hours the employer may operate his plant or his office?

Answer. No. The number of hours you operate your plant or office is left entirely to your discretion.

187. How much extra will it cost the employer?

Answer. If you distribute the hours of work you wish to use among sufficient employees, so that each is employed not more than the average number of hours per week, over a 6 months' period, represented by the long-time average, you would avoid the payment of any tax, except at times when general employment, represented by the monthly average, was greater than the long-time average. At such times the premium you would pay for such excess hours would amount to the same percentage increase in your labor costs as would be paid by all your competitors, so that your competitive position would remain unchanged.

188. How will it affect the employer's costs in relation to his competitors?

Answer. Your costs would not be adversely affected in relation to his, unless he distributed his work so as not to exceed the long-time average and you did not. (See answer to question 187.)

189. How will I determine the wages I must pay?

Answer. Just as you do today. Probably on the basis of supply and demand, on your union scale, if your business is unionized, and on the basis of length of service and training in your organization together with your general philosophy as to the treatment of employees. This plan does not affect the basic wages paid.

190. Will it control the wages I must pay?

Answer. No. The plan has no control over basic wages, except as to the payment of a tax if you work your employees more average weekly hours, over a 6-month period, than the long-time average.

191. If I am a manufacturer, will I have to increase my fixed investment in order to operate under the plan?

Answer. No. Every plant must have equipment to produce for its maximum market. Such equipment may be used one or more shifts. By sustaining your market, the monthly average of hours would remain up and all industry would be able to work relatively long hours. When business fell off you would reduce average hours to the long-time average rather than lay off employees, if you desired to avoid the tax, but this would require no more equipment. While, at such times your unit cost would go up because of your fixed investment, it would be because your production had gone down, not because of this plan. In fact the plan would keep production from falling off so that the variations in unit costs would be very slight.

192. Will I have to hire inefficient workers?

Answer. No. You have the same freedom as today.

193. Will I be able to hire whom I want and discharge whom I want?

Answer. Exactly as you do today.

194. How will I know what the official monthly and long-time average hours are?

Answer. Both the monthly average and long-time average would be published currently in the daily press, would be mailed to you immediately, and would be available at your local Government employment office and post office at all times.

195. Will the monthly and long-time averages as published apply to all employers in the country or to a given region, or to just the employers in my industry?

Answer. Both the monthly and long-time averages will be published for the country as a whole and will apply to all employers throughout the United States.

196. When will the employer pay a pay-roll tax?

Answer. At the close of any 6-month period (June 30 and December 31), during which his employees work more average hours per week than the published long-time average.

197. How much pay-roll tax will the employer pay?

Answer. One and one-quarter percent of the total pay of each employee for each hour or fraction that his average weekly employment exceeds the long-time average. For example, if an employee worked an average of 42 hours a week during a 6-month period and the long-time average stood at 40 hours, you would pay a tax equal to 2½ percent of that employee's pay.

198. To whom will the tax be paid?

Answer. To the collector of internal revenue for the district in which the employer is located.

199. When will my workers receive benefits?

Answer. Whenever the monthly average is lower than the long-time average.

200. Who will pay the benefits to my employees?

Answer. You will, on their regular pay days, but you will be reimbursed for such payments immediately by drawing a draft on the national reserve fund provided on the regular monthly report forms which will be furnished you. The draft can be cashed through your local bank.

201. How will I be reimbursed for the payment of such benefits?

Answer. (See answer to question 200.)

202. Will the employer have to make reports, and, if so, to whom?

Answer. Yes. One report at the close of each month to the National Employment Reserve Corporation.

203. What information will the employer report?

Answer. The total hours his employees were employed by him during the month and the total number of employees on his pay roll on the last working day of the month.

204. Does not this plan interfere with the prerogatives of employers in making it mandatory for them to distribute work under certain circumstances?

Answer. The plan does not make it mandatory. While it requires the payment of a tax for hours above the long-time average, the choice is left to the employer as to whether he will distribute work sufficiently to maintain the long-time average and thus avoid the payment of the tax, or will pay the tax and work the excess hours. He naturally would choose the action that was most economical for him. His competitors would have the same choice, so that his competitive position would remain unchanged.

205. If I simply operate an office but produce no goods, will I be included under the plan?

Answer. Yes. Office employees are included. The fact that you produce services of one kind or another instead of some manufactured product does not change your status as an employer.

206. Would the operation of the plan reduce the individual initiative of the workers?

Answer. It is hard to see how it would; but if it had that effect in the case of some few individuals, there still would be retained the element of compensation as an inducement for efficiency; and this element, through bonus and like schemes, has been largely responsible for the tremendous increase in efficiency in many lines of manufacture. We are prone to consider the efficiency of an individual and not the efficiency of the Nation. Assuming maximum efficiency of an individual at 100 percent, it would be much better, from the standpoint of the Nation, to lower the average efficiency from 100 percent to, say, 90 percent than to have 75 percent of our workers operating at 100 percent and 25 percent at zero because they were unemployed. After all, our individual welfare is wrapped up in the welfare of the Nation, and the Nation can prosper only to the extent that the total population prospers. The material welfare of the Nation depends upon its production, and its production depends upon capital, management, and labor. To the extent that everyone in the Nation helps in the production of wealth will the total level of prosperity be raised.

207. Will it permit the "running of one's own business" with a minimum of Government direction?

Answer. Yes; with no Government direction.

208. Will it maintain the rights of the employer to determine what he shall produce, how much he shall produce, how many hours of labor he shall use to produce it, what he shall pay such labor, and what he shall sell his production for?

Answer. Yes; it leaves all these decisions to the employer, the same as today.

209. Does not the plan penalize those industries which, through good fortune or good management, have been able to solve their own problems of unemployment, particularly of the seasonal variety?

Answer. No. The market for the goods of a given company or a given industry is not primarily among its own employees. Profits depend upon a demand for the goods or services produced. The largest profits would result from a steady demand by those identified with other industries. Therefore, the interests of any industry lie in having employment maintained in other industries even more than in its own. This plan would sustain general employment and effective purchasing power, or demand, and would not interfere in any way with a continuation of stabilized employment which may exist in any industry today.

210. Would not the effort to draw in more workers so as to avoid a tax for hours above the long-time average decrease average wages?

Answer. If it had any effect at all on basic wages, it would work in the opposite direction, because by keeping production up labor would be in demand at all times. Probably what actually would happen is this: The employer always would determine which was the most economical, to continue to work his trained workers longer hours and pay a tax, or to take on additional workers not so highly trained in his own business, work them the hours represented by the long-time average, and thereby avoid the tax. The net result, country-wide, eventually would create a situation where the workers employed on pre-planned work would fall into the least efficient category of labor—those who, generally speaking, would be too inefficient to make it economical for employers to hire them.

211. Don't you think employers would find it difficult to manipulate their labor schedule to keep employees' hours reasonably within the required average?

Answer. No. Because so long as they did not exceed the long-time average they would pay no tax. The long-time average would always represent relatively long hours, which would fluctuate but slightly from year to year. This would enable employers to stabilize their employment without the need for manipulation.

212. Assuming that the long-time average amounted to a 5-day week and an employer found it more desirable to operate 6 days per week, would this not increase his average cost of production?

Answer. Not if labor were paid on the basis of an hourly rate. It would simply mean that the employees would work fewer hours per day for 6 days than if they worked only 5 days, not that they would work fewer hours per week. As the average man-hours worked by any employee would be calculated by 6-month periods, great flexibility would be provided in meeting seasonal peak loads or any emergency situations. It would not necessarily mean additional machinery or less machinery. If a plant had sufficient equipment to operate at the peak under relatively long hours, it would obviously have sufficient machinery to operate under shorter average hours below the peak. Again, the problem would be no different than at present. As production increased, either the present plant would be operated longer hours or additional machinery would be necessary. This would be true just as it is today under a continuous plant operation (24 hours a day, 7 days a week) or under any other method of operation.

213. Would individual employers be willing to pay taxes while their competitors did not?

Answer. They would not be required to do so. The monthly average would be determined by dividing the actual hours used by all employers by the total number of workers employed in private enterprises plus those given employment on public work. There would be no inequality, after having determined the monthly average, in asking all employers to pay a premium if they worked their employees longer hours than the long-time average, which would always be at a high level. While not all of them would distribute work so as to avoid the payment of a tax, they would all have an equal opportunity to do so, except when current employment was above the long-time average, at which time all employers would pay a proportionate tax, which would leave their competitive position on the same relative basis.

Initiating the plan

214. How would such a plan be started?

Answer. Provided the necessary legislation was passed by Congress and signed by the President, the first step would be to announce a given date on which its provisions would become effective. This could be set, say, 90 days from date of passage of the act. That would mean that upon the date set all employed workers entitled thereto would begin to receive supplemental compensation and all workers unable to find employment in private industry would be given employment by the Government on preplanned public works if they had registered at their local employment office. Employers would make their first monthly report at the end of the first full month after passage of the act. This would enable the calculation of the monthly average and its publication in advance of the time the actual operation became effective, 90 days after passage of the act. The long-time average would be determined at the same time as the first monthly averages. The corrected monthly average would be published each month thereafter.

215. Would it be possible for the plan to be put into operation by individual employers rather than to make it compulsory with all employers?

Answer. No. Its purpose is to sustain a market for the entire production of the Nation. No employer can sustain a market for his own production by sustaining the effective purchasing power of his own employees. Under a competitive system the costs of one producer must be kept in line with his competitors or he will be unable to continue to produce. Therefore he cannot increase his costs over those of a competitor. This plan maintains free competition between producers but acts to sustain a market for all production within which such competition can function without damage to the economy of the Nation as a whole.

216. Would it be necessary to take an industrial census for use as a starting point?

Answer. No. Having secured the first monthly average which would be accurate, the initial long-time average would be arbitrarily set at a sufficient number of hours above to provide for the initial increase in current purchasing power determined as desirable by Congress in the enabling act. That is, if 10 percent increase were desired and the initial monthly average was found to be 32 hours, then 10 hours would be added (1 percent for each hour) and the initial long-time average set at 42 hours. Adjustment would be made, according to formula provided for in the enabling act, to correct for the trend thereafter. While there would be some error in the long-time average during the first 10 years of operation of the plan under this method (after 10 years it would be accurate and remain accurate thereafter) the only effect of any factor of error would be to lessen or increase the rate of recovery in comparison with the rate if the true long-time average for the last 10 years were known. This method is therefore suggested in order to avoid the time and cost of accumulating data on employment hours over the past 10 years which at best, due to the nonexistence of accu-

rate data could be only a good approximation. Even if such data were available, the method suggested is preferable while we remain in a severe depression with the need for reemployment of a large number of workers remaining acute.

217. Would any temporary changes be necessary in the plan while it was getting under way?

Answer. No; except as explained in answer to question 216.

218. If the plan was put into effect as soon as possible, how long would it be before industry and employment would feel the benefits to be derived from its operation?

Answer. If it was known that the plan would become effective in, say, 90 days, it would immediately stimulate production because the absolute assurance of a substantial net increase in effective purchasing power within 90 days, through the payment of supplemental compensation, would make it necessary for producers to increase production immediately so as to be prepared to take advantage of such assured increased demand. In other words, the announcement of the plan would cause a stimulation in employment and production, which would cause the employment of many workers even before the actual payments of supplemental compensation started.

219. Has a bill been drafted that would effectuate the plan, if passed by Congress?

Answer. Yes; a suggested bill has been prepared.

220. Would the legislation required to make the plan effective be constitutional?

Answer. Yes; because the entire operation of the plan would be made effective as the result of the placing of an excise tax. Congress has the constitutional right to appropriate the capital necessary for a corporation such as is proposed and to empower it to borrow and to guarantee its loans. It has the right to place an excise tax for revenue to cover its outgo. That is all that would be required to make the plan effective. The necessary act would resolve itself into pure revenue legislation.

221. Is State legislation required for effectuating the plan?

Answer. No.

222. How long would it take to put the plan into practical operation if the necessary legislation were passed?

Answer. It is estimated that it could be put into effect within 90 days.

Administrating the plan

223. How would you determine who was unemployed?

Answer. Anyone who registered at a Government employment office and was willing to accept Government preplanned work would be "unemployed" in private industry.

224. In what manner will the tax for hours in excess of the long-time average cause work sharing?

Answer. Whenever the monthly average is below the long-time average everyone desiring employment, including those given preplanned work, could be employed in private enterprise for the number of hours per week represented by the monthly average if no one was employed in excess thereof. From the standpoint of practical operation, it might prove a real hardship if employers were taxed for hours in excess of the monthly average in order to induce sufficient work distribution to eliminate all public work.

Therefore the tax is placed for hours only in excess of the long-time average over a 6-month period. This means that whenever the monthly average is below the long-time average the tax can be avoided by limiting hours to the long-time average. Because employment would be sustained at all times, this measure of work distribution would be sufficient to avoid many workers being forced onto public work and still would not interfere with practical operating conditions with which the employer is faced. When the monthly average was above the long-time average all employers would be taxed proportionately provided average hours were not permitted to exceed the monthly average. Thus the competitive position between employers would remain unchanged.

225. Would not seasonal fluctuations in production make your monthly average unworkable?

Answer. No. The only purpose of the monthly average is to determine the amount of supplemental compensation to be paid. Such payments would tend to equalize income throughout the year.

226. Would it be possible to publish the monthly averages at the beginning of each month?

Answer. It is estimated that it would take 2 weeks to determine the monthly average after the close of a month. The averages determined would be used for the following month. This lag would not be important.

227. If employers reported monthly, how could an average of weekly hours be arrived at?

Answer. A workweek would be defined as 6 working days. In computing the number of workweeks in any given calendar month, there would be subtracted from the actual number of days in the month, the number of Sundays and holidays (designated in advance). The remainder would be divided by six.

228. How would employers be reimbursed for money expended as supplemental compensation?

Answer. They would draw a draft on the reserve fund in connection with the simple report forms that would be provided. Arrangements would be made so that banks would cash these drafts, which would be paid upon presentation to the Government agency operating the plan.

229. Would it be possible for employers and employees to enter into collusive agreement to report less employment hours than actually existed in order to obtain benefits under the plan?

Answer. Yes; but it would be difficult to keep such collusion from being discovered. Every employee would have a stake in correct reporting because he would either be entitled to supplemental compensation or a job producing a living wage. The loss to him from failure to receive such benefits would be more than the employer could afford to pay for his collusion. By placing all penalties for false reporting on the employer, the employee would sooner or later disclose the collusion and subject the employer to heavy penalties.

230. Would there not be a heavy drain on the reserve fund if the monthly average remained below the long-time average for a considerable time?

Answer. It could not remain below very long because the corrective action of the plan would become effective as soon as it fell below. Purchasing power immediately would be raised above the current level of production (supply), which would force production back to normal. And the time element has nothing to do with repayment. It is mathematically certain that the amount paid out, no matter over what period, will be refunded. (See answer to question 161.)

231. How would the reserve fund be invested?

Answer. If the plan was started during a depression the National Employment Insurance Corporation would use its credit to initiate it, this credit being repaid automatically at the other end of the cycle. Under such circumstances it is doubtful if a reserve fund of magnitude ever would be accumulated. Nevertheless, the point raised is pertinent, namely, how could a large reserve fund be handled so as not to create the very condition which the plan is designed to correct, that is, overinvestment in producers' goods? The following method would eliminate this difficulty.

When the level of employment was above the long-time average it would be made mandatory, as funds accumulated for investment, to invest them in Government bonds, purchased directly from Federal Reserve banks. Against delivery of these bonds the Reserve banks would debit the reserve accounts of member banks. This would decrease the reserves of member banks and contract the national credit base. A desirable brake on the expansion of credit, tending to counteract a too rapid acceleration of general business activity, would result.

Vice versa, when the level of employment fell below the long-time average, necessitating funds for payment of supplemental compensation, it would be mandatory to sell bonds direct to Federal Reserve banks.

Upon receipt of such bonds the Reserve banks would credit the reserve accounts of member banks with the proceeds of the sale. This would increase the reserves of member banks and expand the national credit base. A desirable brake on the contraction of credit, tending to counteract a too rapid deceleration of general business activity, would result.

If it is argued that any mandatory provisions requiring Reserve banks to buy or sell Government bonds would destroy the discretionary authority of the Reserve boards, the answer is that the effect of such mandatory provisions would be highly desirable because the result of such purchases or sales would automatically conform to the action which it is contemplated will be taken by the Reserve banks to counteract too violent fluctuations in the general price level.

And even though it was mandatory for the Reserve banks to buy or sell Government bonds from or to the fund, they could retain their discretionary power to buy or sell in whatever amount they desired in the open market.

232. How large a staff would be necessary to handle the reports which would be received setting forth figures for computation of averages?

Answer. It is estimated that reports from 5,000,00 employers could be tabulated and checked and the averages calculated by not over 500 clerks.

General

233. What advantages does the plan offer over so-called unemployment-insurance plans?

Answer. There are numerous objections to unemployment insurance. The principal ones are: (1) It does not cure unemployment, it simply accepts it. (2) It operates against work-sharing because employers will tend to keep working longer hours when business declines and let part of their force go on the theory that the ones let out will be taken care of through the insurance benefits. (3) The benefits suggested in any unemployment insurance plan put forth so far are inadequate to do more than pay a small weekly stipend for a comparatively few weeks. (4) The insurance fund, if accumulated as a percentage of the pay roll, in good times and bad, obviously will be added to price, so that the effect on effective purchasing power will be negligible in sustaining the Nation-wide demand needed to sustain employment.

234. Why wouldn't it be more practical and easier of operation to limit hours of employment to, say, 30 hours a week?

Answer. Why limit hours to an arbitrary figure when people want more things and are willing to work for them? Any arbitrary setting of hours is simply a guess. It may be a good guess or a bad guess. But the only purpose of limiting hours is to cause work distribution. This plan not only contains a strong inducement for work sharing but entirely eliminates unemployment. (See answer to question 110.)

The following quotation from chapter XI, page 128, of America's Capacity to Consume, just published by the Brookings Institution, Washington, D. C., is illuminating:

"We cannot materially shorten the working day and still produce the quantity of goods and services which the American

people aspire to consume. The actual production of 1929 was accomplished on an industrial workweek which averaged close to 51 hours. The potential 1929 production of $97,000,000,000 (which assumed no unemployment or slack employment) was also predicated on the assumption of an average working week of 51 hours. If we were to shorten the working week to 30 hours, as has frequently been suggested, with a view to absorbing all complete and partial unemployment, the production would be greatly reduced.

"Assuming no change in man-hour efficiency, the reduction from the 1929 basis would be two-fifths, giving a production of $58,000,000,000, of which about $51,000,000,000 would be consumptive goods. If we assume that improved techniques and methods may have increased man-hour productivity since 1929 by as much as 25 percent, the production of consumption goods on a 30-hour week basis (for the same population as in 1929) would be approximately $63,000,000,000. Under these conditions, consumption would have to be reduced below the 1929 level by some 10 percent, since consumption in 1929 was about $70,000,000. On a 40-hour week, with a 25-percent increase in efficiency, and the same level of employment as in 1929, production would be approximately the same as in 1929.

"But has there been any significant increase in productive efficiency during the depression period? While we have made no thorough study of this problem, there does not appear to be much ground for believing that there has been a universal increase in efficiency approaching 25 percent. It is true that in numerous instances new and better equipment has been installed—though this is far from general. It is also a well-known fact that the building of new plants almost entirely ceased during the depression and that expenditures on equipment have in many cases been confined to the making of indispensable repairs. One of the things that we are now relying upon to furnish employment is the making good of deferred maintenance on the railroads, in industrial establishments, and on highways, streets, and other public works. The drastic curtailment in production schedules during the depression in the so-called capital producing industries affords rather conclusive evidence that in general the productive capacity of our industrial establishment, so far as plant and machinery are determining factors, has not been increased materially since 1929.

"On the side of operating efficiency there has been great improvement in many lines of manufacturing, but much less in most other types of productive operations. Man-hour efficiency in manufacturing showed a marked increase during the early months of the recovery period, as compared with 1929, but this was attributable, in some measure, to the fact that the smaller number of employees on the pay rolls represented a more highly selected labor personnel. As the less efficient workers are absorbed, the average unit cost will tend to increase.

"To summarize, if we have a 30-hour working week, with complete utilization of our labor force and productive establishment, and then assume a universal increase in efficiency in agriculture, mining, manufacturing, transportation, marketing, and other branches of industry of as much as 25 percent, we would still have a productive output considerably smaller than in 1929. Unless we can be sure of a vast increase in productive efficiency the working day cannot be appreciably shortened without a curtailment of production and, in consequence, without reducing consumption standards below the level of 1929.

"Looking forward one may, to be sure, paint a picture of productive potentialities that would seem to make the realization of vastly higher living standards easy of attainment. But assuming that all of our existing industrial plant and equipment, except the very latest models, could be summarily scrapped—without cost to anybody—and be replaced forthwith by the best that is known to science, one can conjure up—as some imaginative people have done—vast productive possibilities. But we are confronted, unfortunately, by stern practical realities; old plant and equipment cannot be scrapped without financial costs, nor can the latest improvements be installed instantaneously on a universal scale. The railroad industry affords perhaps one of the best examples of what might be accomplished theoretically; but the realization of the productive economies there possible is held back alike by the immediate financial costs involved, by conflicting interests of the various railway groups, and—not least—by the opposition, incorporated in legislation, of railway laborers who fear the effects of such improvements upon the demand for their services.

"In the light of such practical considerations as these the production dreams of engineers have to be liberally discounted. The most that can be hoped for is a gradual increase in productive output, as existing plant and equipment can be replaced by more efficient types and as new methods can be progressively introduced. It is helpful, in considering this problem, to recall again that during the great era of technological advancement between 1900 and 1929 per capita production in the United States increased by less than 40 percent.

"In due course we can expect a much larger production for the same expenditure of human energy than has yet been possible. But for the immediate future we cannot count on production taking care of itself if the working week is materially reduced. In any event, we are desirous of raising the standard of living substantially above the level hitherto realized, not merely restoring it to the unsatisfactory level then prevailing."

235. How would the plan operate in periods where a high level of employment was sustained?

Answer. Just as it would in other periods, except that at such times supplemental compensation would not be paid. Instead the reserve fund would be accumulated through the payment of the pay-roll taxes.

236. Might not organized labor object to your method of increasing purchasing power during depression?

Answer. Organized labor would have no possible grounds for such an objection. It would receive the benefit of payments of supplemental compensation during periods of depression. Organized labor has always advocated work sharing, and even where industry failed to distribute work the unions themselves shared the total income from work among their members in the form of benefits. They have always practiced the reserve principle, and this plan would make it possible to cut the contributions of its members used to build up reserves to meet conditions which this plan would take care of automatically.

237. Do you believe that any proposal to levy new or additional taxes upon business would meet with favor at the present time?

Answer. If work is distributed so that excessive average hours are avoided, the plan does not involve any additional tax except when the level of business rises above the long-time average. This is the unique characteristic of the plan. It would permit taxes to be materially reduced when business activity was low and taxes were hard to pay.

By relieving the burden of the Government, the States, and the municipalities for relief, general taxation would be reduced.

238. Are there not two separate parts to your plan? If so, are they not contradictory?

Answer. Yes; there are two distinct parts, but they are not contradictory. They are complementary. Although they would operate entirely independently of each other, they would operate simultaneously. The elimination of unemployment is one part of our problem; the other part is to sustain a high rate of production. For example, assume that it is possible to equitably distribute work; even so, unless there is an adequate total to distribute, the share of no one will be sufficient to provide a decent standard of living. Efforts have been made during the past few years to effect a more equitable distribution of work in order to reduce unemployment, but because such efforts have not been accompanied by a compensating increase in total work hours the result in many cases has been to reduce the incomes of those already employed so low that they could hardly subsist or to entirely eliminate profits or to simply raise prices. In other words, work sharing alone is not a cure for depression. Along with any method of distributing work so as to eliminate unemployment must go some method for sustaining a high level of production and employment. Only by creating some device for accomplishing both requirements simultaneously can we insure a universally high standard of living for our people. The two steps are complementary.

239. Would the plan delay necessary movements of labor from one industry to another, just as unemployment relief in England has delayed the readjustments between industries?

Answer. No. It would induce them to take place promptly.

240. The plan makes no provision for old-age pensions. Would it be feasible to make such a provision a part of the plan?

Answer. This plan could include old-age pensions with no material change by simply providing that any registered unemployed worker 65 years of age or over would receive an amount equal to the minimum wages on preplanned work as a pension benefit and without any requirements for actually performing labor. The fund would be sufficient to provide for such pensions if the pensioners were included in the count from which the averages were calculated.

241. Why are two percentages used in arriving at the amount of taxes due or extra compensation due?

Answer. Because there are two distinct parts to the plan, although both parts work simultaneously. The method of placing the tax is designed to cause distribution of work at or below the long-time average. The tax rate would yield sufficient to pay the wages of those unable to find private employment, when given preplanned public work, in addition to the supplemental compensation which would be used to sustain effective purchasing power whenever business tends to decline.

242. Would a worker ever receive supplemental compensation while unemployed?

Answer. No; only when employed.

243. How would the plan affect the building industry with its skilled and unskilled labor, and no constant employment so far as one contracting organization is concerned?

Answer. Just as it would any other industry.

244. What is meant by inflation and deflation?

Answer. Because these terms are used in this pamphlet it is desirable to give the author's definition:

Deflation: Whenever the available means of payment in the hands of consumers is insufficient to buy the current production at current prices. The effect—price reductions, lowered profits, bankruptcy.

Inflation: Whenever the available means of payment in the hands of consumers is more than sufficient to buy the current production at current prices. The effect—increasing prices, excess profits, boom.

Help the Farmer

EXTENSION OF REMARKS

OF

HON. WILBURN CARTWRIGHT

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Thursday, December 9, 1937

Mr. CARTWRIGHT. Mr. Speaker, I believe President Roosevelt had in mind the idea and purpose of helping the American farmer when he called this special session of Congress. He knows that if the farming interests of this country are helped the entire business structure of our country will be benefited.

Personally, I do not believe there is a Member of Congress, either in the House or in the Senate, who is not anxious to do something constructive for the farmer. The trouble is in reaching an agreement. I could fix it for the Third Congressional District of Oklahoma, but in a general farm bill we cannot legislate for just one section of the country or just for the commodity in which a certain section is the most interested—like cotton. We must legislate for all sections of the United States.

For several days I have listened intently to the discussion of this bill—H. R. 8505—which is 86 pages and has many ramifications. I most sincerely hope the changes and amendments adopted will make the bill a better and more workable one for the American farmer. After all an intricate general farm bill like this has to be more or less a compromise. It is a game of give and take. Therefore I am going to discuss the general philospohy of helping the farmer—the object of the bill.

Mr. Speaker, on Tuesday, February 28, 1928, I made my first speech on the floor of this House. It was A Plea for the Farmer, and I wish to quote a part of it.

> Mr. Speaker, it is a fact beyond dispute that no producing group in this country faces such a combination of handicaps and burdens as those which are imposed from the outside on the farmers of America and their families.
>
> These people are my people, Mr. Speaker. I know them. I love them. I belong to them. They are essential to the very existence of this country. Therefore their problems, their needs, and their rights, cannot and must not be neglected or ignored. Regardless of party affiliation, we cannot fail to agree with that great Democratic leader who said, "The farmer who goes forth in the morning and toils all day—who begins in the spring and toils all summer—and who by the application of brain and muscle to the natural resources of the country creates wealth, is as much a businessman as the man who goes upon the board of trade and bets upon the price of grain."
>
> With all my heart, Mr. Speaker, I plead for an honest understanding of the place and the problems of the farmer in the life of this Nation. And I plead further, for earnest support of every constructive measure that may be placed before this body that will bring relief and a fair chance to the agricultural forces upon which the prosperity, the stability, the very life of our country so largely depend. [Applause.]

Mr. Speaker, that expressed my feeling then and it states my sentiment today. May God help us in our deliberations.

Farmers have done more to shape life on this continent than any other major group. Their power remains mighty. Its vigor at the root is our brightest sign that in the not too dim future, the country way of living and working will go forward in better style than ever.

The first President of the United States was a farmer. His natural and abiding interests were farm interests. Mount Vernon, his country home, was the place he loved best. In Washington's day the whole country was rurally directed. Cities were towns, little more than market places for farm people. They have never lost this basic character.

No President since the first has ever been far removed from the farm or farm influence. The same can be said for the industrial chiefs, many of whom were reared on the farm.

Ever since the original colonists landed, the farm family has been the principal unit of settlement and growth. Late in the eighteenth century the second wave of pioneers washed over the top of the Appalachians, westward bound. Up the rivers and trails and down the other slope, they trickled through the woods and emerged upon the prairie. Clearing their farms out of the timber, plowing their acres as soon as the new steel tools came to hand, they built homes and brought the wilderness to life.

Then, somewhat later, sturdy newcomers began arriving from across the sea to work and live here where once the wolf howled, many speaking tongues that seemed strange. Like all of us in some generation they had sailed out of the old country to help fashion the new. They were no strangers; instead, they moved right in and made themselves good neighbors. These streams of related motive and habit and blood commingled. It was all a vast merging of peoples. Their blend is our blend today.

The relationship between farm and town has always remained clear. Today smooth roads and transportation at tenfold speed have made country and town practically one. Hurt the farm and you pain the factory.

Since history began agriculture has been the most important industry in the whole world. Directly or indirectly it provides most of the materials of the three human essentials—food, clothing, and shelter.

The riddle of agriculture reminds me of the village drunkard who asked the policeman where the other side of the street was. The officer pointed to the other side. "No; it ain't," said the inebriant. "I just come from over there. A man told me it was over here. Where is it?" So the farmer, standing on the sidewalk of poverty wishes to go over to the other, the sidewalk of prosperity, but the moment he crosses over the "other side" changes.

A riddle of agriculture is the fact that, in spite of the wonderful improvements wrought by machinery and scientific advancement; in spite of wonderful roads, automobiles, radio, the farmer works as hard as he ever did and, comparatively speaking, receives less than ever.

Two sailors got into a discussion over the kind of animal a heifer was. One sailor claimed that the heifer belonged to the hog family, the other that it was a variety of sheep. Finally they called in Boatswain Bill. "Bill, wot's a heifer; is it a hog or is it a sheep?" Boatswain Bill bit off a large chew, reflectively. Then he said, "To tell you the truth, mates, I don't know much about poultry." And there are many people like the sailors who give us advice by the carload who do not know what they are talking about.

"What is agriculture?" asked the teacher. "Well," responded the pupil, "it's just about the same as farming, only in farming you do it."

There is a growing sentiment that farmers themselves should have more to say about administration of whatever program is developed than they have had. Opinion is strong that the program and the administration of it should be removed from politics and should be handled absolutely as a national and nonpartisan effort. In my opinion, too much emphasis cannot be put on this particular point. The well-being of the farming industry is not a partisan matter. It is of national concern. Every citizen, irrespective of his political affiliations, will be directly affected by what happens to agriculture.

It is my feeling that farmers, who know the problems of their industry better than anyone else, are best fitted to develop a national agricultural program and to participate actively and extensively in its administration. If they are given that opportunity the farm problem will be removed from politics.

One essential in a national policy for agriculture should be a program of conservation. Soil is the wealth of agriculture. Protection of it and of the fertility it contains, and the rebuilding of fertility in soil from which it has been lost, is vital. The Government well can sponsor and promote control of erosion, the growing of leguminous crops, the reestablishment of grasslands, and the reclamation of marginal lands through reforestation, lake building, and other means. Encouragement also should be given to the construction of

lakes, both large and small, where feasible, and for the construction of ponds on as many farms as possible. The program also should promote irrigation from creeks, ponds, lakes, and wells, wherever it can be done, as another means of mitigating weather hazards.

A national agricultural program should favor the family-size farm. It should function so the family-size farm will yield a good living and provide a surplus for security in the future. Development of highly commercialized or corporation farming should be discouraged. Every encouragement possible should be given to those farmers who desire to own their farms, including financial assistance at reasonable interest rates, with a long period during which the loan could be paid off.

Of equal need is a program for the refinancing of current debt of farm owners in order to enable them to retain their farms and gradually retire their indebtedness. Farmers should be able to obtain interest rates comparable with those enjoyed by other industry and by Government.

Farmers are entitled to sell their production in the American market without competition from abroad. That, it seems to me, is of basic importance in any national program. The United States should not import any product of which our farmers can produce an abundance. And in the American market farmers should enjoy prices which will yield at least cost of production and a decent profit.

Agriculture is the principal source of our wealth. The farmers are the stable, conservative element. They stand for good government, for the rights of property, and the rights of men.

During the war, under every sort of handicap, the farmers of America rendered magnificent service in producing the food necessary to feed not only the United States but very largely our Allies. They sent their sons to war, and in spite of the shortage of labor and by dint of increased effort they tremendously increased this country's output of food. Had they not done so, it would have been impossible for us to have taken our part in the war as we did. The war would have dragged on and probably been lost.

The farmers constitute a full third of our population, and the welfare of the Nation is practically bound up with theirs. Yet the benefits of modern civilization have not been extended to our rural communities in any such measure as they have a right to demand.

The farmers have a right to expect from every national administration a Department of Agriculture in full and intelligent cooperation with them and the great farm organizations of America. They deserve to be given the results of thorough and intelligent study as to the cost of farm products at home and abroad and should be furnished the uncensored facts.

In order to keep up increasing interest in agriculture we must give heed to existing conditions of discontent and take intelligent steps to remedy them. The increase in urban population at the expense of rural and agricultural means increased unrest, increased cost of living, and diminished stability. Let us give to the agricultural class the attention it deserves.

My friends, in years to come when the history of this age is written by the impartial thinker, who, at that distance of time, may be able to gain a right perspective and may then be able to say which were the most striking features in our social development, it may well turn out that he will point to the birth of the new interest in the welfare of the farmer as being among the events of first importance.

Not since the birth of modern industry has the farmer had a square deal. Tons of congressional gray matter have been expended to help manufacturing. But I do not believe enough gray matter has been expended to make more satisfactory the lives that produce the food from which we live. The band of legislators who dedicate themselves to farm welfare are a valuable element in Congress.

Let me crystallize my economic doctrines relating to the farmer in the following points:

First. The farmer is entitled to just as good wages for his labor as others get.

Second. He is entitled to just as good living conditions for himself and family as others enjoy.

Third. His children are entitled to as good educational advantages as other children have.

Fourth. He is entitled to just as efficient and adaptable service from the country's banking and financial institutions as other classes get.

Fifth. He is entitled to just as much liberty of action in organizing for selling his products and for regulating production to meet market demands as other classes exercise.

Sixth. He is entitled to taxation, tariff, and transportation policies, which will deal just as fairly with agriculture as with any other business and occupation.

Seventh. He is entitled to a civilization, culture, educational system—literature, art, drama, and so forth—which will recognize, reflect, and utilize the cultural influence of country life, and its environment in the same degree in which present-day culture recognizes and reflects the influence of urban life.

The Farm Bill

EXTENSION OF REMARKS

OF

HON. ALFRED F. BEITER

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Thursday, December 9, 1937

Mr. BEITER. Mr. Speaker, economic planning in agriculture and a desire to put the farmer's house in order has no doubt prompted this bill to provide an adequate and balanced flow of agricultural commodities in interstate and foreign commerce.

My State is interested in this agricultural bill because it ranks sixth among the several States in the value of its farm produce. The Empire State leads all other States in the farm value of fluid milk, for instance. We are therefore interested in what effect this bill will have on the dairy farmers of New York.

I want to take this opportunity to express the hope that the so-called Boileau amendment to the farm bill will be adopted. This amendment will prevent the farmers of our country who have been raising crops of wheat, corn, tobacco, cotton, and so forth, from using acreage taken out of production of these crops for the purpose of growing commodities which would compete with the dairy farmers.

In the number of dairy cows New York stands fourth, being exceeded only by Minnesota, Wisconsin, and Iowa, but I want to emphasize that in the production of milk to be used in fluid form it easily stands first. It is for the protection of these dairy farmers in my State that I ask for the adoption of this amendment.

I feel that the Members of this Congress are trying to perfect a program in agriculture which will as nearly as possible suit the needs of every section. We cannot be expected to enact legislation to help the producers of cotton, tobacco, rice, wheat, corn, and so forth, and ignore the needs of the dairy producers.

I believe that we should bend our efforts to giving the farmers of the country a fair share of the national income and since we are gathered here in special session for this purpose, among others, I am glad of the opportunity to state that in my opinion the farmers of New York State will not question our motives nor challenge our efforts providing we protect the interests of all who are engaged in the pursuit of agriculture as a means of livelihood We must, of necessity, protect the dairy farmer since a sound agriculture program cannot be completed without him.

No one in the House is more desirous of helping the farmer than am I, whether he farms below the Mason and Dixon's

line, the wide-open spaces of the West, or in the great State of New York, a part of which I have the honor to represent, and because of this interest I ask for the adoption of the Boileau amendment. It is only fair that the farmers in New York State and other dairy sections shall not be injured by the operation of this law. We in New York State pay 25 percent of whatever national tax is levied in order that the five special commodities mentioned in this bill may benefit, and we New Yorkers will cooperate in matters affecting the South and the West. We ask in return only that the producers of our fluid milk be protected from undue competition and trespassing. I feel confident that I am expressing the wish of my constituents and of my State when I ask for support of the Boileau amendment, which will afford this protection.

Liberty and Altruistic Fascists; Guns, Nightsticks, Tear Gas

EXTENSION OF REMARKS

OF

HON. MAURY MAVERICK

OF TEXAS

IN THE HOUSE OF REPRESENTATIVES

Thursday, December 9, 1937

ADDRESS BY HON. HAROLD L. ICKES BEFORE THE ANNUAL MEETING OF THE AMERICAN CIVIL LIBERTIES UNION

Mr. MAVERICK. Mr. Speaker, the Honorable Harold L. Ickes, Secretary of the Interior, in New York City last night made one of the best speeches I have ever read. The Secretary's subject was Nations in Nightshirts, and he spoke at the annual meeting of the American Civil Liberties Union. Mr. Speaker, under the leave to extend my remarks, I include the Secretary's address. The speech is the Secretary's, the subheads are mine. It follows:

Shortly after the World War, America, as a land of liberty, was menaced by the madness of men in nightshirts. Citizens who, theretofore, and again thereafter, were decent and law-abiding, with a due regard for the rights and privileges of others with whom they had long dwelt in neighborly amity, became temporarily mad in a craze to squeeze into uniformity the rich diversity of democracy.

They created a duty to hate men born in other countries, although their own ancestors had all been born there. They created a duty to suspect every man born in this country unless of one race and religion, heaping contumely upon Negroes, Jews, and Catholics. Riding forth at night in the anonymity of cowardice, they dragged men from their beds, tarring and feathering, assaulting, and, in some instances, even killing their victims. They hypnotized themselves into believing that they did these things to improve our civilization, to protect our institutions, to keep our blood stream pure.

Ku Kluxism was a harmful local institution that had mushroomed in a country whose Constitution guaranteed to every man immunity from persecution on account of race, creed, or color.

Today America, that survived as a land of liberty despite the madness of men in nightshirts, is far more dangerously threatened by a new madness of nations in nightshirts.

Where benighted men of our own country at one time indulged in a moronic exhibitionism which disgraced the Nation, we now find nations that boast of their civilizations committing deeds of unprovoked violence against their neighbors. And, just as it was with Ku Kluxers here, these nations in nightshirts pretend to believe that they are doing their daily good deed. Invading armies are sent across the borders of other countries that are so weak and helpless as to offer a helpless prey.

"KU KLUX KOUNTRIES" THREAT TO CIVILIZATION

It is easy to magnify an unimportant incident into an international episode for which even an abject apology will not atone if there are rich resources to be had for the taking. If those possessing such a land contentedly pursue the arts of peace, following a congenial mode of life that goes back for generations, they may find themselves condemned as barbaric and forthwith subjected to the civilizing influences of poison gas and of bombs falling from the air upon combatants no less than upon noncombatants; upon women as well as little children.

Under the international Ku Klux Kode, a country can be invaded merely because it is discourteous or entertains thoughts that are distasteful to the aggressor. Countries may be overrun, territory taken, property destroyed, and people killed by the hundreds of thousands in the name of humanity, civilization, or religion, with never a declaration of war uttered.

Legalistically speaking, the world may be at peace while helpless populations are put to the sword. The Kleagles and the Klokards now ride bombers, tanks, battleships, and submarines, over a field of operations that is international.

The raids of the nightshirt nations constitute the greatest threat to civilization since the democratic principle became established. Fundamentally, their thrust is against the right of peoples weaker than themselves to live their lives in their own way. Having thoroughly suppressed among their own citizens every aspect of real freedom, they seek to deny precious rights and liberties to others. The time has come when even the strongest democracies in the world must be prepared to resist inroads upon their liberties by totalitarian states. And this resistance must be as intelligent as it is mobile.

POLITICAL ABSOLUTISMS AND THE PRESS

We have seen how, in other parts of the world, political absolutisms, whether of the right or of the left, have maintained themselves by the rigorous suppression of political rights which we regard as fundamental. The press is not an organ of free opinion. It may not print any views, or even any news, that are distasteful to the government. Not only is news suppressed, as for instance the addresses of the President of the United States when he talks about liberty and democracy, but news is colored and paradoxical as it may sound, "news" is invented.

Children in the schools are taught to believe what it is desired that they should believe. Lives are regulated down to minute details.

Even religion is modified, controlled, or suppressed. Spies abound. The people live for the state. They are urged to beget more and more children, to become political robots in their turn.

The only liberty to which they can confidently look forward is the liberty of death. And long before death comes to the body it has cast its grisly shadow upon the soul.

Fascism, whether of the right or of the left, is the greatest threat in the world today. It is a threat even to our own America.

It is all the more dangerous because it pretends that its purpose and ideal are to preserve the world from communism.

It is a strange phenomenon that that country which is weak and helpless and at the same time rich in resources is a hotbed of "communism" and therefore must be saved as a brand from the burning by some altruistic fascist. [Laughter.]

And just as certain nations, uttering the excuse that they are stamping out communism, commit crimes at which savages would blush, so in our own land those who would undermine our democratic institutions do it under the same hollow pretense. Every candidate for office in America who lacks a real issue proceeds to shout "communism." Any male or female hysteric, gluttonous for notoriety and unscrupulous about achieving it, can always uncover a "red network." [Laughter.] Employers who deny to their workers the right to associate together in a labor union for the common good of all frequently declare that they do so because of "communistic" influences which are at large in their factories.

It does not require much intelligence to see that such communism may become a wooden horse within the bowels of which ruthless fascism may enter the shrine of liberty.

WHO ARE THE REAL ENEMIES OF AMERICA?—GROVER CLEVELAND KNEW

As a matter of fact, it is the fascist-minded men of America who are the real enemies of our institutions. They have solidarity, a common interest in seizing more power and greater riches for themselves, and ability and willingness to turn the concentrated wealth of America against the welfare of America.

It is these men who, pretending that they would save us from dreadful communism, would superimpose upon America an equally dreadful fascism. [Applause.]

We speak of fascism as if it were something different from communism, but from the point of view of democracy the two are fundamentally the same thing. Grover Cleveland saw this, although in his day fascism not only was not recognized as an institution, it was unknown as a term. Over 50 years ago, in speaking of communism, he said:

"Communism is a hateful thing and a menace to peace and organized government; but the communism of combined wealth and capital, the outgrowth of overweening cupidity and selfishness, which insidiously undermines the justice and integrity of free institutions, is not less dangerous than the communism of oppressed poverty and toil, which, exasperated by injustice and discontent, attacks with wild disorder the citadel of rule."

DEMOCRACY CANNOT AFFORD TO NAP

If the people are to keep their democratic spring free from contamination either by the communism of the proletariat or "the communism of combined wealth and capital," of which Grover Cleveland so wisely spoke, they must depend upon themselves.

And let no one sleepily believe that our democratic form of Government is necessarily secure for all time to come.

We have seen dictatorships in other lands reach out and destroy constitutional democracies.

We have heard ventriloquists for dictators sneer at and condemn the democratic ideal.

We have observed totalitarian states combine, not only for protection, but for aggression.

We have discovered that fascism has not been quarantined but that it is capable of leaping wide oceans.

There is a world-wide struggle on today between the forces of absolutism and those of democracy. If we are to preserve our dearly won, our highly cherished freedom, we must be on the alert against any abhorrent system of government that is alien to our traditions, to our desires, and to our aspirations.

It does not even need to be said that under an absolute form of government, whether of despised communism or of equally obnoxious fascism, our precious civil liberties, the safeguarding of which are the concern of the Civil Liberties Union, under whose auspices I speak tonight, could not possibly exist.

What rights of free speech, free assemblage, or free worship, regardless of race, creed, or color, exist today in certain of the countries of the world?

And who would care to live in a land where the only right to express an opinion is the right to parrot what some dictator has said; where the only right to meet with one's fellows to discuss public questions freely is the right to pass resolutions accepting policies imposed by a superior force; where the only right to worship is in accordance with a formula and in a manner decreed by another; where descent from an ancient and honorable line of itself makes one subject to oppression, to be stripped of one's possessions, and required to live under conditions that are scarcely to be borne?

SNIPINGS AT LIBERTY MUST BE WATCHED

Are the rights guaranteed to us by the Constitution dear to us? Then we must continue to fight for them. We must not close our eyes to the snipings at liberty that are going on behind our own democratic front.

History has proved that the people must themselves defend their liberties. At times even their constitutional officers—legislative, executive, and even judicial—that they may secure some selfish interest, or from fear fail to defend the Constitution, an oath which they have sworn to uphold.

Local officials have parroted Louis XIV's "I am the state."

The rights of free speech and free assemblage have been ruthlessly disregarded by constituted authorities on more than one occasion.

Mobs, reacting to primitive lusts, have tortured and killed their fellow men, sometimes for grievous offenses against the State, sometimes for mere peccadillos, and sometimes when they were innocent of fault.

Police and militia have injured and slain men while acting in accordance with their undoubted legal rights. In many instances "strikebreaking" has been synonymous with "lawbreaking."

Peonage at times raises its ugly head in our land.

Agent provocateur has become a fixture in our language.

GUNS, NIGHTSTICKS, TEAR GAS

Minority groups frequently have been victims of a crude racial prejudice.

Men have been discriminated against on account of the color of their skins or because of their religion or race.

Newspapers, lacking in influence and in circulation, but expressing views opposed by those in high places, have felt the heavy hand of pressure.

Censorships have been exercised.

Policemen, with their guns and nightsticks and even with tear-gas bombs, have broken up meetings because someone with influence has not liked the political theories or the social philosophies that were to be expounded, although both theories and philosophies were well within the law.

Arresting and prosecuting officers, by physical or mental torture, have forced citizens to testify against themselves.

It is all very well for those who with bank accounts well padded with liberal corporation fees, and who strut the stage as "great constitutional lawyers," to be alarmed professionally for the safety of our institutions. It will be time enough for the ordinary citizen to weep with them when evidence is given that these hypocritical mourners, who wear the crape of privilege, are really interested in the essential integrity of the great document that they pretend to revere; when they show that they have some appreciation of the fact that the protection of the Constitution was intended to extend to all of the people of the United States, even the humblest; when they admit that, in the final analysis, the Constitution was set up as a bulwark to insure a maximum of human liberty, not for a few, and not merely for the many, but for every human being in the land.

What the framers of the Constitution could not foresee, but which Grover Cleveland sensed in his time, was the effect upon our liberties of the great concentration of wealth, through the growth of corporate power, during the last several generations.

Profound changes have occurred in our economic life. All of us have come to pay tribute, just or unjust, to corporate overlords which stand between us and the State much as the feudal barons stood between those who worked the soil and their king. Our economic life is no longer dominated by individuals acting in defense of their own property but by large corporations whose powers, like those under feudalism, are more nearly akin to government than to those of an individual.

IS A MAN A MONKEY?—WHAT IS A CORPORATION?

We are just beginning to understand the degree to which giant corporations have assumed an overlordship over the civil rights and substantive liberties of the individual. For a long time we failed even to grasp the significance of this problem. For a long time it never occurred to us that these great corporations, which we created and in whose creation we took pride, would come to rule over us. We forgot the laws of evolution; we forgot that corporations are not mere individuals because they evolved from men. We needed to learn that a corporation is no more a man than man is a monkey.

Many of our large corporations have annual budgets far in excess of those of many a city and State. Many of them own and control outright more property than the taxable wealth of many a city and State. Not a few have more security holders than many of our cities and States have citizens. Neither the security holders nor the employees of our large corporations have anything like the voice in the management of these corporations that the citizen in a democracy has in the management of the State.

Our State and Federal Constitutions carefully safeguard the rights of the individual in his relation to his government. Our State and Federal Constitutions have been construed by the courts so as to safeguard the rights of the largest corporation in its relation to the Government as if it were a mere individual. But our State and Federal Constitutions are woefully inadequate to safeguard the ordinary citizen in his relation to a great corporation which may control his investments, his labor, his business opportunities, and even his rights and liberties.

Despite individual differences, monkeys can manage to live among monkeys and men among men, but Lilliputians cannot live among Gargantuans. Today the average man, be he farmer, laborer, or businessman, is subservient in numerous ways to concentrated economic power vested, not in the State, but in an irresponsible and self-constituted corporate oligarchy, benevolent, and paternalistic at its best, despotic and predatory at its worst.

The individual, weak and helpless in his struggles with and against corporate power, has turned to Government for protection only to find that corporate power frequently controls Government. Government protection, when obtained, unfortunately has often been frustrated by the courts, the traditional defenders of civil rights and liberties.

Eminent counsel, retained by corporate power, have been eminently successful in convincing judges, many of whom were themselves trained in the service of great corporations before ascending the bench, that the Bill of Rights, which our ancestors fought to obtain to protect their human rights, is really a charter of corporate privilege.

"WE HAVE JUST BEGUN TO FIGHT"

The struggle of the individual against the oppression of corporate power has only just begun. By no means has it been won.

Large corporations dictate the wages and hours of millions of workers. Legislation which proposes, not to fix wages or hours, but merely to set minimum standards for those workers who cannot protect themselves by collective bargaining, is assailed as bureaucratic and dictatorial.

Supposedly liberal writers who have droned on quietly for years while the Tom Girdlers, the Jimmy Rands and other corporate czars dictated the labor policies of the Nation, suddenly become alarmed for human liberty when it is proposed that the State protect the worker who cannot protect himself. We see a Walter Lippmann, with the obsequious dignity of a butler, shoving intellectual fodder into the rack of the Fascists whom he once despised. [Laughter.]

Those of us who have fought to protect the civil rights of the individual against the aggression of the state, now must recognize that it is equally necessary to protect the civil rights of the individual against the aggression of corporate power.

Of what avail is it to prevent discrimination by the state because of race or of religious, political, or economic faith if such discrimination is allowed to corporate power which in many ways has shown itself to be stronger, more pervasive and much more ruthless than the state itself?

CIVIL LIBERTIES AND THE SUPREME COURT OF THE UNITED STATES

A sad part of the long record that has been written on the infringement of our civil liberties has to do with the Supreme Court of the United States.

It is commonly believed that this Court has been far more liberal than legislative bodies in protecting civil liberties. Unfortunately the facts do not bear out this general belief. On the contrary, the Court has gone far to convert the Bill of Rights, which was intended as a charter of human freedom, into a charter of corporate privilege.

The Justices who have been the most solicitous to protect property rights have been the least vigilant in the defense of human rights. All too frequently, in cases involving civil liberties, great liberals like Holmes, Brandeis, Stone, and Cardozo have constituted a minority. At times, when the tide of passion and intolerance has run high, the Court has run with and not against the tide. The Court has gone out of its way to apply and construe wartime espionage statutes to restrict freedom of speech when there was no imminent present danger to the Nation.

The Court has gone out of its way to apply and construe prohibition statutes so as to expose individuals to searches and seizures traditionally regarded as unreasonable.

When the Congress, all too rarely, has sought to protect minority groups against racial discrimination and economic coercion, the Supreme Court has frequently nullified its efforts.

Perhaps it is to be expected that public officials, depending upon popular favor for their offices, might at times put the Bill of Rights carefully away in cold storage. Perhaps it is to be expected that judges, appointed for life, but who nevertheless take to their high positions the passions, the prejudices and the predilections that were theirs before they donned the long black gown, at times should fall into the error of believing that the Bill of Rights is

not what it was really intended to be but what they may say that it is. But what of some of our newspapers, which ought to be particularly sensitive with respect to the Bill of Rights? They sometimes set up a clamor at some real or fancied invasion by the Government of their right to express themselves freely. It might be expected that, jealous as they properly are of their own rights, they would be equally concerned about the rights of free speech and of free assemblage on the part of citizens, generally. But are they?

THE TRUTH, THE WHOLE TRUTH, AND NOTHING BUT THE TRUTH

It might be argued that, implicit in the right of free speech, is the obligation to speak the truth, the whole truth, and nothing but the truth so far as this is humanly possible. Yet this obligation is frequently overlooked. There are even magazines that pretend to be liberal that on occasion indulge in misrepresentation, misstatement, and calumny as callously as the yellowest of yellow journals. There are those who believe that a heavy duty rests upon publishers, not only to tell the truth, but not to propagandize, especially if the propaganda indulged in is for the purpose of creating in the minds of the people a false impression with respect to their government.

We have valued the freedom of the press in the belief that it would encourage the dissemination of facts and the expression of divergent ideas.

Our ancestors fought to prevent a State censorship of news and ideas.

Our ancestors did not fight for the right of a few lords of the press to have almost exclusive control of and censorship over the dissemination of news and ideas.

Yet, under the stress of economic forces, our press and news agencies are coming more and more under the domination of a handful of corporate publishers who may print such news as they wish to print and omit such news as they do not wish to print. They may even color the news.

Even the individual news writers have little to say as to what news shall be printed. It is useless for us to pretend that, generally speaking, editorial policy has no influence upon the reporting of the news. On this point a recent book, The Washington Correspondents, by Leo C. Rosten, is both interesting and illuminating. It is rarely difficult for an intelligent person to ascertain the political or economic views of the newspaper owner without recourse to the editorial page. This despite the fact that free government depends upon the free dissemination of news.

I am glad to be the guest of the Civil Liberties Union tonight. I regard this as one of the bravest organizations in America. Its purpose is to defend those whose constitutional rights are invaded.

It goes to the aid of the weak and the oppressed, regardless of race, color, or creed. It fights for free speech, the right of free assemblage, the right to worship according to one's conscience.

It is nonsectarian, nonracial, nonpolitical.

It is the devoted servant of freedom, a brave volunteer in the finest cause that a citizen can serve.

I hope that it will continue to carry on and that it may even enlarge its horizon. Changing times bring new dangers. Those who are concerned with the civil liberties of the individual must now be prepared to defend the spirit of the Bill of Rights not only against government at home but also against corporate concentration at home and propaganda from abroad.

While we guard our civil liberties from the state, we should beware not to lose them to powers more menacing than the state. [Extended applause.]

The Boileau Amendment

EXTENSION OF REMARKS

OF

HON. HAMPTON P. FULMER

OF SOUTH CAROLINA

IN THE HOUSE OF REPRESENTATIVES

Thursday, December 9, 1937

Mr. FULMER. Mr. Speaker, I have watched with deep interest the work of the Roosevelt administration to help the farmers. I have supported the farm programs and have tried to support every proposal that would make them more effective. It is my sincere hope that this pending bill, on which the able chairman and members of the House committee have done such sincere work, will finally be passed in a form that will be of tremendous service to agriculture. Under the Bankhead bill and under past programs many farmers have not received a square deal, but this was largely because of what was done by home people who had charge of the programs in the various States.

One of the great benefits that has come to my State and to the whole South from the present Triple A soil-conservation program has been the production, particularly by the farmers, of more things on the farm for their own use. Lands taken out of cotton have been used to produce vegetables, fruits, poultry, and dairy products. And we of the South are producing more hogs for our own people. These healthy foods have done much to raise the standard of living among farming people of the Southern States.

All through the South there has been an effort to encourage the use of more land for growing food, feed, milk, and butter on the farm. Practically all of the southern newspapers have carried on since 1934 a statesmanlike campaign, called the "plant to prosper" campaign, aiming to encourage sufficient diversification of farming to make possible a better living among the country people, and to induce farmers of the South to grow crops other than a one-crop cotton, and thereby stop sending out of the South millions of dollars annually of cheap cotton money to purchase these things.

In the hill sections of the South this has been a great thing. A good many of you know that in some rural areas of the Southern States there has been real suffering because of deficiencies in the consumption of milk and vegetables. The production of home food and feed has been part of a consistent fight to stamp out rickets, which undermines the health of children and may make them lifelong cripples, and to end pellagra. All that is needed to win this fight on these diseases is more milk and more vegetables in the diet.

In the period of the farm program we have made great strides ahead. Three years of this present program—1934, 1935, and 1936—were accompanied by an increase of 60 percent in the production of hay and an increase of 15 percent in pasture.

This increase of hay and pasture in the South has been used to frighten the northern dairymen into believing that they needed something like the Boileau amendment. But, in actual fact, as I will point out later, it has not increased competition with the northern dairyman but has had the contrary effect. It will not hurt the dairyman in the future. In proof of this I want to quote the following statement from a national authority. He is Dr. A. G. Black, Chief of the Bureau of Agricultural Economics of the Department of Agriculture. The statement I quote is taken from an address by him before the annual meeting of the American Farm Economics Association at Chicago, December 29, 1936. He said:

> It is probable that the commercial production of dairy products will not be greatly affected by the programs. While the shift from grain to hay may tend to increase cow numbers it also will tend to decrease milk production per cow. The regional trends in dairy production, which have been evident for some time, probably will be continued and possibly slightly accelerated by the programs. Consumption of dairy products in rural areas probably will be increased.

So Dr. Black shows that the real effect of the farm program will be to build up the consumption of dairy products, and hence the health of the people, in the rural areas.

Now, we have never thought that our progress would injure any other part of the country. We have always been convinced that so far as the dairy farmers of Wisconsin or of New York State were concerned, they had nothing to lose but everything to gain from improvement in conditions and living standards of the South.

But now comes Representative BOILEAU, of Wisconsin, with an amendment which would prevent the sale, exchange, barter, or gift of products from poultry or livestock produced on lands taken out of cotton, corn, wheat, or other soil-depleting crops.

Concerning this amendment I wish to make two contentions. The first is that the commercial dairy industry has been helped and not injured by the triple-A programs, and that the Boileau amendment is not in any degree needed. The second contention is that the Boileau amendment would probably wreck the entire agricultural program, and that it would at least destroy the home food and feed program in the Southern States.

Concerning the first proposition, I contend that producers of wheat, cotton, corn, and tobacco will be forced

into competition with the dairy industry by just one thing, and that is ruinous prices for the kind of production to which their lands and climate are better suited.

In support of this proposition I want to submit the following table which shows the relationship between the farm price of cotton and shipments of butter from seven cotton States to markets in New York, Boston, Philadephia, and Chicago. The States are Alabama, Arkansas, Mississippi, North Carolina, Tennessee, Texas, and Georgia.

Average farm price of cotton

	Cents
1929–30	16.8
1930–31	9.5
1931–32	5.7
1932–33	6.5
1933–34	10.2
1934–35	12.4
1935–36	11.1

Shipments of butter

	1,000 pounds
1929–30	11,813
1930–31	12,476
1931–32	14,072
1932–33	14,429
1933–34	6,645
1934–35	5,200
1935–36	6,490

These figures suggest that the price of cotton is the determining factor in southern commercial dairying. This general rule holds good for other crops as well as for cotton. Wheat, cotton, and corn farmers are not dairy farmers by nature, nor are they livestock farmers. They go into the dairy and livestock fields only when the price of their own product is so low that they need other means of piecing out their incomes.

These figures show that from 1930 to 1932, when cotton prices were falling, the cotton farmers shipped steadily more dairy products into the big-city markets to compete with the products from Representative BOILEAU'S State of Wisconsin. This table also shows that when cotton prices or cotton income was rising from 1933 to 1936, the southern farmers withdrew more and more from competition with the dairy producers of Representative BOILEAU'S State in the great city markets of the North.

If Representative BOILEAU and the other Congressmen from Wisconsin and New York and neighboring dairy States want the farmers of the Southern States to go back into competition with them in the big dairy markets, then the way for them to get this competition is to load down the farm program with amendments which make it unworkable. If our farmers cannot make enough money out of cotton and wheat and corn and tobacco, then they will take to milking the cows; and the low buying power of the people in the cities in these surplus producing areas will force our farmers to move their dairy products into the metropolitan markets to compete with the commercial dairy industry of the North. Let it be understood that the South can, if forced to do so because of low-price cotton, compete with any other section in producing hogs and in the dairy business.

My second contention is that the Boileau amendment would jeopardize the whole farm program, and particularly the live-at-home program of the South. The Boileau amendment would encumber the program with absolutely unworkable restrictions. The farmer would have to prove that the sheep he raised did not eat grass from the land taken out of cotton if he sold any sheep. The farmer's wife might want to feed 99 percent of the eggs from her poultry to the children. But if she needed a little money in an emergency and sold a dozen eggs, the farmer would be liable to forfeit the payment if the hens had done their scratching on the diverted acres. Under this amendment the farmer would have to watch his cows to see that they did not stray onto the land taken out of tobacco or cotton. In fact, the farmer might think that the safest thing to do was never to let a pig or a sheep feed on the grass of the diverted lands so as not to run the risk of jeopardizing his payments. The net effect would be to condemn the diverted lands to idleness.

I do not know, of course, what effects this amendment may have upon the wheat farmers of Kansas or the corn farmers of Illinois. But I do know that in the South it will endanger one of the most useful parts of the whole A. A. A. program—the live-at-home movement. I am convinced that it will be just as bad in its effects in the wheat regions and in the corn regions as in the tobacco and cotton areas.

Therefore, I plead with representatives of the dairymen of Wisconsin and New York to join with us of the South and the West and the Corn Belt in voting this Boileau amendment out of the bill so as to safeguard our whole farm program.

The Indigent Transient Problem

EXTENSION OF REMARKS

OF

HON. THOMAS F. FORD

OF CALIFORNIA

IN THE HOUSE OF REPRESENTATIVES

Friday, December 10, 1937

ADDRESS BY MAYOR FRANK L. SHAW, OF LOS ANGELES, BEFORE THE ANNUAL MEETING OF THE UNITED STATES CONFERENCE OF MAYORS, WASHINGTON, D. C., NOVEMBER 16, 1937

Mr. FORD of California. Mr. Speaker, under leave to extend my remarks in the RECORD I include the following address of Mayor Frank L. Shaw, of Los Angeles, at Washington, D. C., November 16, 1937:

Mr. President, distinguished guests, and honorable colleagues, volumes have been recently written and much has been said on the problem of the transient unemployed. As Dr. Ellen C. Potter has remarked, "More progress has been made in 5 short years along this neglected byroad of relief than in the 150 years which have preceded." Nevertheless, I feel that there is ample excuse for presenting a brief discussion of the problem before this conference. Reliefs and remedies for unemployment remain our major concern despite improved conditions. The plight of the migratory unemployed and the serious situation presented by this group to municipal governments has been little changed by the relief programs of the last 4 years. You and I as public officials confront this fact every day. Every day we must deal with it as practical administrators, while we continue to hope for some ultimate solution. It is unthinkable that such a meeting as this should pass without committing to the record some thought upon this problem.

It is true that the cities of the Pacific coast and certain sections of the South are more keenly aware of the transient unemployed than those of other parts of the country. The study prepared for the Works Progress Administration by Mr. John N. Webb, discussing the migratory casual worker, reveals that out of 500 cases examined more than one-fifth sought their principal employment in the three Pacific Coast States. Add to this proportion the larger part of fugitives from drought and flood areas, who come directly to southern California, and you will understand our deep concern with the problem. But it cannot be our problem alone. The minute we undertake defensive measures the consequences are felt all the way across the continent. Two years ago, when Los Angeles was compelled to establish a border patrol to turn back indigents, the repercussion was immediately felt by cities and States as far east as Mississippi.

As early as 1933 the Federal Government recognized the special problem of the migratory unemployed and undertook measures to relieve these people. The transient camps, established and maintained by the Federal program, contained some 306,000 persons in September 1935. Incidentally, while California has but 4.7 percent of the population of the United States, 14 percent of the transient unemployed of the country at that time were in the Federal camps of our State. Then, with little warning, the Federal problem was completely liquidated in 3 months, leaving the problem apparently as big as ever and certainly no nearer solution than before.

Today it is probable that somewhere between 500,000 and 600,000 persons, including many family groups, are wandering through this country without ample means of support. The net annual earnings of the great majority average less than $300 each. They forage as they go. They huddle together in unsanitary squatter settlements and in "jungles" that radiate disease throughout the community. Their children do not receive any education much of the time, and when they are enrolled in school they find themselves retarded 2 or 3 years behind children of their own age. It is not surprising that more fortunate people, who have established permanent homes and possess substantial occupations, dis-

like having such migrants in their midst. They are foreigners everywhere in their own native land. In Los Angeles, disagreeable as the facts appear, we find it necessary to charge a large part of our crime to these transients. In the winter of 1936 we found that 24 percent of all vagrants arrested by our police had previous felony records. A study just completed by the Los Angeles police department shows that for the fiscal year 1936–37, of those arrested and sentenced from our city to the State penitentiaries, 32 percent of the homicides, 34 percent of the robberies, 21 percent of the burglaries, 15 percent of the forgeries, and 21 percent of the thefts were committed by persons who had been in California less than 1 year. It is our experience that our total crime rate increases 20 percent during the winter months, and that this increase is entirely accounted for by transients from outside the State. I do not doubt that other cities of the West and Southeast can verify every one of these facts from their own records.

I direct no indictment against the transient unemployed as individuals. I recognize that it is superficial thinking which dismisses them as "worthless bums," "undesirables," and the like. This is not a time to argue about who is to blame for their condition. Even if we knew, the knowledge would lend little help toward a solution of the difficulty. The immediate problem is not one of morals or ethics. It is an exceedingly critical problem of economics and social administration. Hence you will pardon the omission of sentimental pity, on the one hand, or raging condemnation, on the other hand, from this discussion.

I have mentioned the study made by Mr. John N. Webb for the Social Research Division of the Works Progress Administration. Mr. Webb draws a careful distinction between the migratory-casual worker and the depression transient. He remarks that in the former Federal-aid programs the two types were merged in their claims for relief. It is true that the immediate social problems created by each, and the emergency treatment required, is identical with the other. Especially during the depression years, the two became difficult to distinguish. The migratory-casual worker suffered unemployment in even greater degree than the workers of fixed residence. The resident unemployed, indeed, largely filled the demand for seasonal labor and crowded the marginal migratory worker out of the picture. So the latter, like the depression transient, became simply a person driven from one place to another, looking for jobs that did not exist. But the ultimate solution of the problem requires careful distinction between the migratory worker and the depression transient. We know them both, very well, in California.

The seasonal migratory worker, who follows the crops or the industrial activities through the country, fills a definite economic need. In grain crops he is in demand throughout the States west of the Mississippi. In fruit crops he is best known to the Pacific States, and to Georgia and Florida. In beet and berry crops he travels up and down the Pacific coast and the Mississippi Valley. Railroad work takes him throughout the United States, but especially in the North Central section. Logging operations take him through the Northwest and into California. In normal times he is self-supporting, on a low level of subsistence. He is typically without family ties. He becomes a serious social problem only during off-seasonal periods, when he and his fellows tend to congregate in our Western cities to spend their small savings and then to become public charges in jails, or charitable institutions, until they can again wander forth in search of work. The problem imposed upon us by migrants of this class is to better their working conditions, raise and stabilize their incomes, give intelligent direction to their movements from place to place, and improve their standards, until such time as agriculture and industry may be so organized as to reduce the seasonal factor to a minimum.

Prof. R. L. Adams, of the University of California, estimated that 97,642 migrants in need of manual employment entered our State in 1936. His estimates for the present year will reach approximately the same figure. Both totals, I may say, are too conservative, and the actual numbers run not less than 10,000 more. In any case, Prof. Paul S. Taylor calculates that fewer than 15 percent of this number comprises migratory casual workers, of the type I have just described. This calculation is substantially verified by Edward J. Rowell in his article published in the Monthly Labor Review in December 1936. This writer shows that 79 percent of the indigent transients who entered California in the year ending June 15, 1936, came from the drought areas in the Middle West and Southwest, seeking new settlement. Our Los Angeles police department now raises that estimate to 89 percent. In a report filed with the United States Senate on July 3, 1937, the Secretary of Labor declared that 200,000 people have migrated from the drought area recently, and more of them are expected to move in the near future. Four-fifths of them, the Secretary declares, have gone to California. The State has received an additional influx of indigent migrants from the flood regions of the Mississippi Valley. Inevitably, some of these people join the ranks of the seasonal workers. For the rest, we have at present only two choices. We must either care for them and secure a foothold for them at the expense of our own taxpayers, or we must round them up like cattle and ship them back to the States they came from. The far West is no longer a frontier, with tillable soil to be had for the asking, and a living to be made by anyone with an ax and a plow. With more than 120,000 employable residents of California still on our relief rolls, it is not easy to see how we can "crowd over" to make room for these newcomers. And we recognize, as well as anyone, that transporting the homeless back and forth across the country is an aggravation of the problem rather than a solution.

Our Social Welfare Act of 1933 in California provides that no person is eligible to public relief until he or she has been a resident in the State for 3 years and in the county for 1 year. We are compelled, by circumstances I have described, to enforce that law strictly. And yet, local, private, and public agencies in Los Angeles even now are expending $16,000 a month for emergency relief, averaging nearly 600 cases a day, of transients who are unable to claim permanent aid under the law. We repatriate transient applicants for relief as rapidly as their places of legal residence can be determined. This policy means that thousands are careful not to apply for relief. They do one of three things. They starve. They turn to lives of crime. Or they go out and take jobs away from our resident workers, by underbidding them in the labor market. Our State relief administration reports that between 11 and 15 percent of the transients who apply for relief are found to have no legal place of residence in any State of the Union, although by far the larger part of them are natives of the United States. These are turned off to swell the ranks of those others, who become a menace to themselves and to society. We are offered no help whatever from the outside, toward solution of this problem which the outside has sent to us. In response to a most urgent appeal, which I directed to the Works Progress Administration last July, I was advised that, under the terms of the emergency-relief appropriation act of this year, no program for transient relief could be developed, except at the expense of local W. P. A. quotas. Since we now carry approximately 60 percent of our local relief load on local resources, we cannot entertain such an alternative.

At this point permit me to make an additional comment upon a phase of this problem that deserves special consideration. I have already mentioned the educational difficulties that arise for the children of indigent transient families. The other side of the same situation is the extraordinary burden imposed upon the educational facilities of the communities concerned. I have just received a report that 7,023 pupils were enrolled in the high schools of Los Angeles this fall, none of whom ever attended a school in our city before. Most of these have entered the high schools in the low-rent area, causing serious congestion. Seven thousand new pupils amount to more than 200 classrooms full of children. At an average of 20 classrooms per school, this would require 10 new high schools for proper accommodation of the overload. Twenty-six percent of this increase comes from the drought region. We estimate, in Los Angeles, that we must have a fixed capital investment of $675.70 to provide accommodations and equipment for each high-school student. In addition to that the current operating cost of our high-school establishments amounts to $148.57 for each pupil for 1 year. In other words, the taxpayers of Los Angeles are immediately called upon to provide $824.27 for each of these new pupils. These costs are not excessive, being approximately the average for the entire United States. The parents of the overwhelming majority of these new pupils are practically nontax producing. Where Los Angeles taxpayers are going to get four or five million dollars immediately to care for this abnormal migration of these children of unemployed is no easy question to answer. I have mentioned only the high-school problem. The elementary-school problem has not been estimated.

The only alternative to the undue local burden for education of these children at the present time is that they shall not be educated. This alternative is a serious one. We find it necessary to use legal compulsion on many transient families in order to get them to enroll their children in school anywhere. They evade the school laws in every possible way in the hope that the children may be kept free to earn a few cents. I dread to think of the future lives of these children. How many of them will be recruited into the ranks of crime and dependency within the next 10 years?

As I have already remarked, while most of the information I have recited is based upon our California experience, nevertheless it is a problem for all of us in one way or another. Other cities suffer similar situations in greater or lesser degree. Those that do not are certain to feel the reaction of any defensive measures adopted by communities that are feeling the burden. Nineteen States of the Union are represented in the migration of drought and flood refugees to Los Angeles alone in the last 2 years. Some of them are represented to the extent of tens of thousands of cases. They cannot escape the consequences of any decision that is made or any program that is adopted.

It has become the fashion, in recent years, whenever we are confronted by great difficulties to insist at once that these are problems for the Federal Government. There is not a little justification for our attitude. In so many factors of modern life, State boundary lines are simply fictions. But in this problem there is an older precedent for asking Federal intervention. That is the distinctly interstate character of the problem. Any attempts at solution on the part of the separate States will unavoidably involve a snarl of reprisals that will only complicate the difficulty. Local efforts, unable to contemplate the entire situation, will produce only superficial results. Purely local relief will mean aggravation of the trouble in other quarters. Only the Federal Government can rise above such efforts and carry out a program that will be at once effective and fair to all.

The resolutions adopted by the Trenton conference on transients and settlement laws, held in New Jersey last year, the council of State governments held in the National Capital last January, and the Midwest conference called at St. Paul last March all agree there is no hope for solution without adequate Federal support and supervision of whatever program may be devised. In the words of the Trenton resolutions, they agree that transiency is a problem

having its roots in conditions beyond the control of the individual States. In one respect the Pacific States will disagree with the resolutions of these three conferences, and our disagreement proves even more plainly the need for Federal action. That point is the proposal for uniform laws on establishment of residence. So long as our Pacific region continues to be the principal goal of the depression transient, and so long as we have no compensating assistance from other States or the Federal Government, we must protect ourselves with higher residence restrictions than other sections. We cannot do otherwise, in simple fairness to our own people. Nor can we consent to the Midwest conference proposal that indigents shall not be returned to their places of legal residence without the permission of those places. I believe that both in our agreements and in our differences we thus confirm the claim upon the prompt aid of the Federal Government.

There are four things that the Federal Government can obviously do. First, it can provide immediate relief by restoring suitable transient camps, and by compensating local subdivisions for emergency medical and hospital aid required. Second, it can adjust W. P. A. quotas so that nonresidents may be given employment in suitable numbers and for limited periods, and charged to the quotas of their places of legal residence. Third, it can give increased rehabilitation aid to distressed regions, which will induce residents of those sections to remain where they are. Finally, it can direct, through the Federal employment service the flow of migrants to places where jobs are available, or where permanent settlement is feasible, and discourage their movements to other quarters where they will only become public burdens. To quote Congressman VOORHIS, "California needs Federal aid to help meet its nonresident relief problem. But a far more constructive approach, from the standpoint of California, is Federal action to guide, stabilize, and reduce this whole migratory movement."

I conclude with the words of a resolution adopted at the Los Angeles regional meeting of the United States Conference of Mayors on May 15, 1937. "Those cities and communities which receive undue influx of migratory indigents are confronted with extraordinary emergencies of relief, social welfare, and crime control far in excess of those with which such local jurisdictions should be expected to cope. These migrations are interstate in character, and therefore constitute a national problem and responsibility."

Farm Bill of 1937

EXTENSION OF REMARKS
OF
HON. GLENN GRISWOLD
OF INDIANA
IN THE HOUSE OF REPRESENTATIVES

Friday, December 10, 1937

Mr. GRISWOLD. Mr. Speaker, my first notice of a special session of Congress came with the radio address of the President in October. One of the reasons given for the calling of the special session was the need for legislation to aid the farmer. The President had just returned from a trip across the country. He was familiar with the needs of the farmer. The farmers of Indiana and the Corn Belt, naturally, expected some benefit from any farm legislation enacted.

For 9 days that farm bill has been before the House. It will be passed by the House today, and the farmer of the Corn Belt will be in no better position by reason of this House bill than he was before. The cotton farmer may have been aided, the tobacco grower and rice grower may benefit, the cattleman who breeds grass-fed cattle to sell in the Corn Belt for feeders may profit, but the slogan seems to be, "Save the corn-hog farmer—never."

Day after day of this debate we have watched Republican Representatives of agricultural areas and industrial districts walk down with smiling faces to join the Democrats from seaboard States and the cotton South to demolish the Lucas amendments offered in the interest of the corn-hog belt.

The Corn Belt is suffering now from too much corn and too low a price. The percentage of corn sold commercially is negligible. Corn in the Corn Belt is sold when made into pork. Cheap corn means low-priced hogs. It was claimed that the intent of this bill was to remedy that condition. If we have too much corn, the way to get rid of it is to reduce the surplus. If we have not too much corn, there is no necessity for the legislation at all. Over a 10-year period the average amount of corn consumed in the United States for domestic uses plus the corn exported is 2,380,000,000 bushels. This is the limit of United States corn which the world can use.

This bill, backed by the Secretary of Agriculture, Mr. Wallace, starts with the normal base. It then adds 7 percent, which makes 2,540,600,000 bushels, which is to constitute the ever-normal granary. On the basis of our average needs over a 10-year period it is abnormal by more than 160,000,000 bushels, and that is a lot of loose corn to be available when an endeavor is being made to maintain the price. But the bill provides for an even greater supply than this. An additional 15 percent, or 381,000,000 bushels, making a total of 2,927,600,000 bushels, must be on hand before any attempt is made to decrease the amount by applying quotas, and then they can be applied only after an election.

Under this bill we must reach beyond the ever-normal granary and have about 3,000,000,000 bushels of corn on hand before we can attempt to do anything about it, and we are placed in the ridiculous position of saying we are trying to pass a farm bill to equalize production with consumption by producing a third more than we can possibly dispose of. By some strange alchemy we are going to have less by producing more.

The Lucas amendments would have cured this inconsistency. Insofar as the Corn Belt farmer is concerned, they would have lent some tinge of reason to the bill to counteract the taint of an abysmal ignorance of Corn Belt needs.

This bill gives the farmer no assurance whatever of a definite price for his corn. Every farmer knows that when he puts high-priced corn into the first 150 pounds of a hog and the price of the hog drops a few points he can never get his money out of the hog, even if the rest of the hog is made from 30-cent corn.

Hogs are made in less than 7 months. It is the quick fluctuation in the price of corn that destroys the profits of the corn-hog farmer. A parity price for corn is 87 cents per bushel. The Lucas amendments endeavored to prevent this rapid fluctuation by providing loans ranging from 55 to 80 percent of parity price, dependent upon the available supply of corn, but the amendments were voted down.

Only a short while ago the Democratic Representatives from the Corn Belt turned a kindly ear to the pleas from the tenant farmer and sharecropper of the South for aid. They joined in giving financial aid from the public fund to the industrial East, and again only last August they helped supply from the public chest $60,000,000 which was claimed to be necessary to save a destitute cotton kingdom.

The farmer from Indiana joined in supplying the feast for all other agriculturists of the Nation; but when he himself comes asking, not alms, but only a loan, he is refused.

I shall vote for a motion to recommit the bill. If that fails, I shall vote for this bill. It contains not one beneficial item for the corn-hog farmer. I shall vote for it because the Senate also has a bill, and it is my hope that when the one bill passes the Senate and this bill passes the House, that among the conferees of that other body the farmer of the Corn Belt will have a friend who is willing to unbar the door that is now latched against him, so that out of the much that is granted to other farmers he may receive at least a pittance.

A. A. A. Soil-Conserving Payments—$10,000 or Over

EXTENSION OF REMARKS
OF
HON. FRED L. CRAWFORD
OF MICHIGAN
IN THE HOUSE OF REPRESENTATIVES

Thursday, December 9, 1937

Mr. CRAWFORD. Mr. Speaker, there has been comment on the floor of the House from time to time since I have been a Member of this body relative to certain large payments issued under our agricultural programs. It is no wonder the debt-burdened farmer of Michigan fidgets while Congress

fiddles with another farm bill when he sees reports to the effect that one firm alone receives over $57,000 in soil-conservation payments while the payments in Michigan average $54 per participant. And the firm receiving the $57,000 check was not located within the 48 States. It might also be added here that more than half of the amount involved in these payments of over $10,000 went to the offshore areas.

As I look over the list of persons and firms benefiting under these large payments and then turn to the financial statements of such as these firms as are available I recall that Benjamin Franklin said:

> Vessels large may venture more,
> But little boats should keep near shore.

The big ships are some of these large companies listed below whose operating statements show handsome, earned surpluses, and who have paid dividends and extra dividends. The little boats are the Michigan farmers, or the small farmers of any other State, laden with a cargo of debts instead of earned surpluses, and who were unable to make dividends on the $1,240 income which the Department of Agriculture has just credited them with having.

This report of the Department of Agriculture shows a total of $851,515.79 involved in these large payments, only $400,001 of which went to cooperators in the continental United States. The largest payment of the entire group went to the Fajardo Sugar Growers Association of Puerto Rico in the form of a check for $57,080.36 and the second largest check went to the same Territory to the Luce & Co. for $46,230.95.

Let us look at the available record of the recipient of this largest check—the Fajardo Sugar Growers Association. This association's net income per annum under the policies of the New Deal's sugar program of subsidizing off-shore areas has jumped from a deficit of $49,087 in 1933 to a net income of $2,306,289 in 1936, according to the published figures. This company has total assets of more than $14,000,000 and of this total more than $4,000,000 of current assets with only $454,000 in current liabilities; or in the language of the financial man a favorable ratio roughly of 10 to 1 and with an earned surplus of over $7,000,000. From this, one can see how badly companies of this type need a contribution from the sugar-consuming taxpayers in the United States amounting to $57,080.36. The financial report of this company also shows an item: "Due from Federal Government $203,401."

This is an illustration of the rank exploitation being imposed upon Puerto Ricans by absentee landlordism resulting in our having to send to Puerto Rico $1,500,000 monthly in order to provide relief for those removed from the small individual farms by consolidation of acres into great plantations which are now receiving additional emoluments under soil conservation.

Then, also listed among the big-check recipients is California's Natomas Co., upon which the New Deal has apparently bestowed a double blessing in its man-made control of Mother Earth's products. Besides its agricultural interests the Natomas Co. is interested in gold mining. So it not only receives soil-conservation money directly from the Federal Treasury, but it also received a neat profit through the administration's act in hiking the gold price. Records indicate Natomas produced fewer ounces of fine gold in 1936 than it did in 1932, but its available financial report shows that its gross proceeds from gold in 1932 were only $1,296,398, while in 1936 under the $35-an-ounce price of the New Deal the company shows gross proceeds from its gold of $2,072,193. This company has, in addition to the land it is paid to keep under soil conservation, approximately 4,000 acres of gold-dredging properties. This includes one area, I am told, that is estimated to contain 7,500,000 cubic yards of gold-bearing gravel.

The payments made to these domestic and foreign holders and operators of lands located in California and to the sugar estates of Hawaii and Puerto Rico are illustrative of the unneeded financial assistance conferred and the expense imposed upon the consumers of sugar when legislation of this type operates.

In a great many cases large landholdings in California, Arkansas, and Hawaii are owned and operated by citizens of the United States who contribute to the maintenance of our Government on the same basis as the small operator located in Michigan, Minnesota, or other States. Those residing in Puerto Rico are not subject to the same tax laws as those who operate in the Territory of Hawaii and the States of the Union.

This statement of payments of $10,000 and over when applied to the financial position of the recipient is a clear-cut illustration of the unfairness and inequity which is always woven into legislative procedure of this type. It is further evidence that such laws, if they are to be enacted should carry provisions which absolutely prohibit payments over and above specifically designated amounts.

I attach hereto the latest list of payments over $10,000 made public by the Agricultural Adjustment Administration:

All payments listed were for diversion of land from soil-depleting to soil-conserving crops and for soil-building practices.

The list by States and insular regions follows:

California, total, $255,363.92:

J. E. O'Neill, Fresno, Fresno County, $30,760.68; Kern County Land Co., Bakersfield, Kern County, $28,485.65; Banducci Bros., Bakersfield, Kern County, $33,668.93; Frick Bros., Bakersfield, Kern County, $28,718.93; K. S. Battelle, Corcoran, Kings County, $18,372.21; the Ervine Co., Tustin, Orange County, $12,789.51; G. F. Scheckler, Stockton, San Joaquin County, $11,551.13; River Farms Co. of California, Knights Landing, Yolo County, $28,544.35; F. E. Redfern, Dos Palos, Fresno County, $10,975.92; Natomas Co., Sacramento, Sacramento County, $14,564.68; Sutter Basin Corporation, Ltd., Robbins, Sutter County, $36,931.93.

Arkansas, total, $89,317.54:

J. O. E. Beck, Hughes, Crittenden County and St. Francis County, $10,908.13; Poinsett Lumber & Mfg. Co., Truman, Poinsett County, $10,608.39; Lee Wilson & Co., Wilson, South Mississippi County, $14,979.74; General American Farms, 130 applications in various counties, $37,908.33; Metropolitan Life Insurance Co., 175 applications in various counties, $14,912.95.

Minnesota, total, $24,995.81:

State of Minnesota, Department of Rural Credit, Polk County, $10,883.14; State of Minnesota, Department of Rural Credit, Marshall County, $14,112.67.

Kansas, total, $11,127.57:

Collingwood Land Co., Johnson, Stanton County, $11,127.57.

South Dakota, total, $19,196.90:

Northwestern Mutual Life Insurance Co., Brown County, $19,196.90.

Hawaii, total, $348,202.74:

Hawaiian Comm. & Sugar Co., Ltd., $35,868; The Lihue Plantation Co., Ltd., $33,499; Oahu Sugar Co., Ltd., $28,166.10; Waialua Agricultural Co., Ltd., $24,884.50; Maui Agricultural Co., Ltd., $23,924.50; Pioneer Mill Co., Ltd., $23,626.60; Ewa Plantation Co., $19,762.80; Kekaha Sugar Co., Ltd., $18,074.50; Kohala Sugar Co., $15,935; Hawaiian Sugar Co., $14,352.55; Hawaiian Agricultural Co., $13,950.65; McBryde Sugar Co., Ltd., $13,456.45; Honolulu Plantation Co., $12,741.10; Wailuku Sugar Co., $12,189.65; Hawaiian Pineapple Co., Ltd., $25,224.09 (covering applications for two farms); Olaa Sugar Co., Ltd., $11,124.25; Kahuku Plantation Co., $10,993.25; California Packing Corporation, $10,429.75.

Puerto Rico, total, $103,311.31:

The Fajardo Sugar Growers Association, $57,080.36; Luce & Co. S. en C, $46,230.95.

Tax Relief for Business

EXTENSION OF REMARKS

OF

HON. HERBERT S. BIGELOW

OF OHIO

IN THE HOUSE OF REPRESENTATIVES

Friday, December 10, 1937

RADIO ADDRESS OF HON. HERBERT S. BIGELOW, OF OHIO, ON TAX RELIEF FOR BUSINESS, THURSDAY, DECEMBER 9, 1937

Mr. BIGELOW. Mr. Speaker, under leave to extend my remarks in the RECORD, I include my radio address of December 9, 1937:

The Nation has awakened to the fact that our economic health is affected by our methods of taxation. Bad taxes, not big taxes merely, but bad taxes act as a blight on business.

Business leaders are up in arms against some of these bad taxes. Industrial plants may find themselves in a situation in which it

may be wise to plow their earnings back into new machinery or plant expansion. The Government, however, says to them that they must, nevertheless, pay their earnngs out in dividends or suffer a super tax of 27 percent on these earnings.

The tendency of such a tax is to check the flow of capital into capital goods, and thus to rob heavy industries of orders and employment. It is a tax on prudence in accumulating reserves for slack times. Such a tax naturally is resented by business managers.

The larger business concerns can make their protests heard, as they are now doing. But the very small business ventures have to suffer in silence. We feel that these small independent enterprises are good for democracy and should be encouraged. But our tax system is choking them out.

Business, big and little, wants tax relief. I start this broadcast with the assumption that business really needs tax relief, and that tax relief would help labor as well as business, for they both go up or down together.

This much being conceded, this question arises: If we take taxes off the back of business, where are we going to put them? Are we just going to shove these taxes around without any thought of who bears them, so long as we ourselves escape? If not, what principle or philosophy of taxation is there to which our taxing methods should conform?

It is bad practice to put taxes on commodities the selling price of which is raised to cover the tax. Such taxes are, indeed, covered. They are hidden sales taxes.

A glaring example of this is the tax on medicinal alcohol. You pay your druggist $6 a gallon. Twenty-five cents is the manufacturer's price. Four dollars and sixty cents is tax. Four dollars and sixty cents tax on a 25-cent commodity. That is tax banditry.

Now, we are raising billions of revenue in precisely that way. There is no time to dwell on how that reduces the power of the public to buy these commodities and thus restricts business volume. But that is obvious. Prices should be kept low, and one way to lower prices is to take the taxes out of them.

This can be done by confining ourselves to nonshiftable taxes.

There are three kinds of taxes that cannot be shifted: Taxes on inheritances, and incomes, and land values. Because taxes on houses can be shifted to rent, most people jump to the conclusion that taxes on land can be shifted. But this is an economic illusion. The reason taxes on commodities can be shifted is that the production of the commodity can be curtailed and scarcity produced until the price covers the tax. But land is fixed in quantity. If they taxed the shoes of your factory, you would stop making shoes if you could not add the tax to the price. But the land cannot vanish the way shoes can be made to vanish. A tax on shoes reduces the supply. A tax on land has the opposite effect of increasing the supply of land that is offered for sale.

Now, agreeing that there are billions of dollars of tax burdens that raise prices and are otherwise hurtful to business, the question is, Where are we going to put these taxes? If we push them off one business onto another business, a selfish advantage may be gained for somebody, but there will be no gain to the Nation.

As I see it, if we want to relieve all business and thereby increase employment and prosperity for everybody, there is only one of three things to do. We must shift these taxes to inheritances or incomes or land values. We might bear down more heavily on the larger inheritances. We might get more out of the income tax. Perhaps the higher incomes could stand more taxation. To tax the lower incomes is not sound, for then we cut the standard of living down below what it should be. We might amend the Constitution and tax the incomes on tax-exempt bonds and on the salaries of the politicians.

But the point I wish to make is that the best thing to do with these taxes that we want to get rid of is to put them on land values.

Anywhere else that we put them we are likely to do harm. But I hope I can make you see that if we put them on land values we will actually do good. We will tone up the economic health of the country. We will help the country by taking these taxes off from business, and we will help the country again by putting them on land values.

Here is a fellow, let us say, who has some land down in a blighted slum area. Enterprising builders want to employ labor to build better housing, and they need this land. That excites the cupidity of the owner of the land. He demands all he thinks the traffic will bear. His demands greatly exceed the tax value on which he has been paying.

He may overreach himself and demand so much as to block and defeat the improvement. That often happens. In the very worst slum area of my city of Cincinnati, where the taxpayers have to spend $3 for every dollar they collect, to cope with the excessive ill health and the crime of the district, it would be impossible to acquire the land for rehousing for less than fifty or sixty thousand dollars an acre. This inflated price of the land is one of the chief deterrents to building enterprise.

Now, the point is that the lower the tax on that land, the easier it is for owners to hold out for their speculative price. The heavier the tax the more costly it would be for them to hold the land and wait for their price. The thing to do is to lighten the tax on buildings and increase the tax on land values. The tax will help persuade the landowners to be reasonable, and paying less for the land and less taxes on the house will certainly stimulate building. That is the way to revive the building industry.

We say we need a revival of building to get us out of the depression. But we let the landowners hold up building with their unreasonable prices, and, if this tribute is paid and a building is put up, we slap the taxes on it. We penalize with taxes the thing we want, when we might use the taxing power to penalize the monopoly obstructions to industry.

If I rob a hen coop, they take me down to the police court and fine me once. If I build a hen coop they take me down to the courthouse every year and fine me. Isn't that a brilliant way to encourage industry?

To the extent that we do use the public credit to stimulate building we will inflate land values. It would be far more sensible for the President and the Congress to advise the cities, if they wish to get rid of their slums, to untax buildings altogether and raise their local revenues by increasing the taxes on land values enough to make up for the loss of taxes from buildings.

I happen to have the figures for Cincinnati only, but they are sure to run about the same in all cities. The total real-estate tax revenue of Cincinnati amounts to slightly less than 1 percent of the value of both land and buildings. If the same amount of money were raised by a tax on the land value alone, the tax rate would be 2½ percent.

Now, I ask the home owner which he would rather do: Pay 2½ percent a year tax on his lot alone, or 1 percent on both house and lot. The fact is that such a shift of the local tax burden to land values would reduce the tax on practically every home in the city by at least 25 percent.

Of course, it would raise the taxes on the landowners down in the business center. But these landowners should pay more, for their lands have been soaking up the social values of the entire community. The unearned increment of land value has risen on these lands as cream rises to the top of a pan of milk. There is a law of economic gravitation which sucks values into these centers. One way to make a fortune is just to squat on these acres and let them grow in value.

A few generations ago these acres were cabbage patches. Now their fabulous ground rents support the pension roll of the rich. To put a tax on this way of getting wealth without earning it would seem to be more ethical and sounder economics than to soak business with taxes. And surely it would be more decent to divert some of these unearned dollars into the Public Treasury than to put sales taxes on the purchases of the poor.

I would like to help get tax relief for the men who lie awake nights worrying about how they are going to meet their pay rolls. I have admiration and tax sympathy for the men who have the urge to make things and who risk their capital in the perilous field of productive enterprise. But I don't want to relieve them at the expense of other businessmen, nor by increasing the tax burdens of the poor. I think that producers should be relieved at the expense of squatters.

Land value is not the only form of unearned wealth. But it lies out in the open. It is easy to get at. It is, in fact, publicly produced property. Economics and ethics and religion unite to justify it. Yes; even religion.

There thunders down the ages the command uttered as the voice of God saying: "The land shall not be sold forever, for the land is mine and ye are strangers and sojourners with me."

The earth is God's. Man can make none of it, yet to live he must use it. It is, therefore, beyond all dispute that each generation as it arrives on the earth has a God-given right to the land. We cannot divide the land up and give each one his share. But in our property laws and in our tax methods we should not lose sight of the common right and public interest that attaches to the land of the country.

The way to honor this principle in our complicated modern civilization is to shift taxes from industry to land value, to the end that industry may be encouraged and land hoggishness and land monopoly may be discouraged.

I would be happier as a Democrat in Congress if the leadership of my party were leading in this direction.

Scarcity Programs Will Shut the Door Against Further Development of Our National Well-Being and Succeed in Freezing the Farmer Into His Present Position

---

EXTENSION OF REMARKS

OF

HON. HENRY G. TEIGAN

OF MINNESOTA

IN THE HOUSE OF REPRESENTATIVES

Friday, December 10, 1937

ADDRESS OF GOV. ELMER A. BENSON AT THE MINNESOTA FARM CONFERENCE, STATE CAPITOL, ST. PAUL, MONDAY, OCTOBER 4, 1937

Mr. TEIGAN. Mr. Speaker, the address of Gov. Elmer A. Benson printed below gives expression to the hopes and

needs of the farmers of the country. It will be noted that the Minnesota Governor does not approve of an economy of scarcity, but is unqualifiedly for an economy of plenty. Such a scheme is not embodied in the farm bill which is now before Congress and which will probably receive the approval of both House and Senate before this special session comes to an end. It will be noted, too, that Governor Benson is for market control, which in turn "will involve price fixing with the aid of the Federal Government."

The address reads as follows:

I had looked forward with great happiness to this day. I had expected to spend all of it with you, "sitting in" on your debate of the various questions and proposals that will be raised here, and thus learning, along with you, from the discussions of this conference.

Circumstances, however, have denied me this privilege. I shall have to leave here as soon as I have addressed to you these few remarks.

I want to begin by welcoming you to your State capitol. It is, after all, the headquarters of the people of the State, who have built it. And this welcome holds not only for the hours of this conference, but for any time when you have problems or causes to bring here.

The spirit of this conference would be violated if, in its opening moments, I were to place before you a set of already formulated proposals. It was called for the purpose of setting in motion a train of democratic exchanges of experience and opinions, leading to a collective judgment as to what are the next steps in the formation of a farm program for both the State and Federal Governments.

In that spirit I bring before you my own remarks. I shall limit myself to pointing out three things—first, the nature of the farm problem itself; second, a few general principles that I think we should not lose sight of when we formulate programs; and third, specific situations in Minnesota with regard to which we can, if we will, take definite Government action.

II

First of all let us try to lay our fingers directly on the farm problem itself. Briefly, it is as follows: A farm family, in order not to be bankrupt, must maintain a margin of income over expenditures. This means, on the one hand, that the farmer must receive prices which in the long run exceed his expenses of production; it means, on the other hand, that he must not have to spend all of whatever income he receives in merely trying to keep the farm property going.

We can state the matter in another way. At present, the farmer is, on the one hand, the victim of a market that he does not control; on the other hand, he is often pauperized by an accumulation of debts and expenses which control him.

The result is that many farmers, as well as their communities, show an alarming trend toward bankruptcy.

There, in a nutshell, is the farm problem, as I think you will all agree.

III

This problem takes many different forms and has many different phases. Before we tackle any of them, I think we ought to line up in our minds a series of general principles which we shall try neither to forget nor to violate in our planning for farm legislation. I submit to you a number of such general principles, not with the thought that they constitute a complete and final guide, but only with the hope that, as far as they go, they will commend themselves as representing a formal statement of your own experience and judgment.

In the first place, when we deal with the farm problem we need constantly to bear in mind that it is a double-headed problem. Legislation which lightens the farmer's debt load at the production end but leaves his crops unprotected at the marketing end still leaves him open to destruction, and the same is to be said of legislation which gives him crop control without helping him to lift himself out of the mire of debt into which circumstances beyond his control so often thrust him. I do not mean that every particular bill must seek to accomplish both these ends. I only mean that no matter how good are our various proposals, if we do not go at the problem from both these ends, our legislative action will be entirely inadequate.

Next we need to be extremely cautious when we come to the subject of surplus.

We have heard a good deal of talk about preventing surplus. But what is a surplus? A surplus is something for which there is no use, no demand. It is in order to ask the persons who tell us that there is no demand what they mean by that word. Do they mean the wants that people have, even though they are without the money in their pockets to buy what they want? And do they mean the things that people could come to want if their wages and income were increased to the point where their standard of living were raised? If that is what these people mean by demand, then there is widespread demand and little surplus in this country.

But if, by demand, these persons mean buying power, if they mean the money in people's pockets to buy the things they need and should have, then we must surely agree with them that demand is down and surplus is up. Over one-fourth of the people in this country are now living on less than $600 a year—$50 a month.

The remedy for this situation, however, seems to lie in the increasing buying power rather than curtailing production. The problem that faces the farmer in this connection is that of finding some way to see that what he produces is distributed.

Scarcity programs will shut the door against further development of our national well-being and succeed in freezing the farmer into his present position. I believe the majority of our farmers are strongly opposed to such programs. Further, I think we have a duty to ourselves and our posterity to work toward abundance and not scarcity.

Then there is a third general proposition of which I should like to remind you before you begin your deliberations.

The economic ills which afflict the majority of our farmers are duplicated in every State in the Union. Further, these misfortunes are, in many instances, the direct result of unjust patterns of conduct in our economic affairs.

But it is a mistake to argue from these facts that the State should leave the whole job to the Federal Government, or that there is not much use trying to do anything in the face of certain obviously unjust social arrangements. There is a great deal that we can do.

IV

Let me hastily point out some of the specific difficulties facing farmers for which remedies may be had through legislative action by either the State or Federal Government.

First, there is the march toward tenancy. In recent years there has been a rapid trend in the direction of ownership of the land by those who do not operate it. Insurance companies, mortgage companies, and so forth, are rapidly becoming the landowners.

We need not face this problem with despair. The job is to help farmers to keep out of tenancy by making it possible for them to get out of, and keep out of, the vicious circle of debts and mortgages. Such measures are available to us as tax exemption and tax graduation, the right kind of loans at the right time, and favorable refinancing terms.

Then there is the problem of tenancy itself. Loans with a low rate of interest, and loans on a crop-payment plan would help some tenants to buy land and thus move out of tenantry. Others might be greatly assisted by experimentation in cooperative types of farming. For assistance in such matters as these, we shall have to look mainly to Federal legislation.

Soil-conservation and land-utilization measures are needed by all farmers, but especially by tenants and those living on poorer farms. The present Federal Farm Tenancy Act provides for soil conservation, but funds are entirely inadequate.

Rural electrification, providing low-cost power, is needed by all farmers and rural communities. I think it needs the most earnest attention.

The further development of producer and consumer cooperatives will be one of the greatest services that can come to our people in rural communities, and I think you would be doing a great service if you could work out any plans whereby the State departments might lend aid to such development without at the same time leaving cooperatives in any way financially dependent upon the Government.

Finally, and most important of all, our farmers need some degree of market control. Otherwise, they cannot receive more adequate and more stable prices. To achieve and maintain such control is absolutely impossible without Federal assistance.

In this connection there are two matters especially that I think should have the most cautious attention. One is the matter of attempting market control through control of production. Experience has shown that the result of this attempt is not always market control. Next is the matter of the ever-normal granary. Is it to be regarded merely as a means of storing a surplus which will be available in years of drought or famine, or do you believe that it should be employed as an attempted means of taking surplus off the market?

Market control will involve price fixing, with the aid of the Federal Government. If this is based on a fair exchange value to apply only on that portion of the crop which is domestically consumed, I do not see how anyone can object to it on the grounds of fairness. Manufacturers have not hesitated to use tariffs for price fixing, monopoly corporations have fixed prices, public utilities have even won the support of the Federal court for price fixing, and the railroads have received similar assistance from the Government in their rate making.

In any event, Federal legislation is necessary if market control is to be established, and certainly thousands of farmers are looking toward the necessity of such control.

These are only some of the more outstanding of the problems upon which either State or Federal legislation is possible and desirable. Upon some of these matters I have rather definite convictions, but I have tried mainly to avoid making definite proposals about them, because I know that we shall have to have many discussions before programs upon all these matters are finally shaped.

One proposal I should like to leave with you, and that is that you should make provision both for a State farm legislative program and for a Federal program which will be the basis of cooperation with other States.

Before leaving here, I should like to voice certain beliefs of mine with regard to the place of the farmer and the Government in the meeting of these problems. I believe most of you will be in agreement with me upon these matters.

Certainly the farmer's place in our society is not that of a mere creature of toil whose chief end is to work on the land so that he may extract from it materials which, by becoming articles of commerce, will be the means of profit for others but not for himself. That would make the American farmer a serf, rather than a citizen.

Furthermore, I believe it is the business of a democratic government to preserve democracy—and that includes economic democracy. We have a right to expect of Government that it plays its part in seeking to discourage the entrenchment of economic inequalities, and in promoting the development of equality of opportunity.

The vast majority of our farmers, both in Minnesota and the Nation, do not now enjoy such equality of opportunity. It is my hope that this conference may play a part in helping them to achieve it. In that spirit, I wish you well in your deliberations. I deeply regret that I shall not be here to take part in all of them. And I assure you of the most wholehearted cooperation by this administration.

I Vote "No"

EXTENSION OF REMARKS

OF

HON. LYLE H. BOREN

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Friday, December 10, 1937

Mr. BOREN. Mr. Speaker, my colleagues in Congress, I have not been in Congress long enough to speak with the voice of experience on the legislative processes, neither have I been from the farm long enough to forget how many backaches there are in a bale of cotton. I have spent the most of my life up to now on the tenant farm. I now own and operate a farm. I feel that I am entitled to be heard on the farm bill. I know farm life and farm problems.

Let me say at this point that if prosperity comes again to America it will come when, and only when, there is something besides empty space in farmers' pocketbooks.

The American farmer has more courage and self-reliance than any other man in the world, and I will not vote for a bill which sells the American farmer into serfdom.

Stripped of all camouflage and verbiage, the present farm bill makes the Secretary of Agriculture a dictator whose power is ultimately absolute in its control over every American acre. In the terms of this bill, the Secretary is instructed to practice an economy of scarcity, the greatest fallacy that has ever been perpetrated upon a thoughtful people.

Proration for soil conservation or to prevent the destruction of any natural resource is undoubtedly wisdom, but curtailment to create waste acres is unquestionably absurd and foolish.

Again we are faced with the old fallacy of the bridge builder. In a far country there was a deep impassable ravine. On one side lived a tailor who had too many suits of clothes in his tailor shop, but who was in need of pork for his table. On the other side of the ravine lived a farmer who had a great surplus in hogs, but whose family was ill-clad. And a third individual conceived and executed a plan to build a bridge to permit commerce to pass over the ravine. He then sent out notices to the farmer and to the tailor to come and trade on the bridge; but he instructed the farmer it would take two hogs to get one suit, and he instructed the tailor it would take two suits to get one hog. So the trading went on until finally the man on the bridge had so many hogs and so many suits that he was unable to utilize the vast accumulation. Despite the fact that the farmer did not have enough suits and the tailor did not have enough pork, notices were placed on the bridge that trading had ceased because there was a great surplus and no need for further production and exchange.

The present farm bill declares that in a world where half the people will go to bed hungry tonight and where half the world will start tomorrow ill clad, declares that there is a surplus which must be controlled by the destruction of production.

No nation ever profited by destroying goods or restricting the production of any goods unless that restriction were based solely upon the wise use of a depleting natural resource. The Congress knows that the American farmer does not want acreage control. Every tenant farmer in America knows that Providence alone controls the forces of production. We cannot legislate control of the rain, the wind, and the seasons, and by the eternal I am not going to be a party to legislating serfdom on the great independent citizenry which makes up our American farmers.

The farmer needs and wants only one thing. That is a market for his product. First, it is undeniably right that American markets belong to American farmers, and intelligent farm legislation must be drawn on that principle. Market quotas, not acreage quotas, can be set as a domestic allotment for a parity price market. If America can consume 10,000,000 bales of cotton and 200,000,000 bushels of corn, then allot so many bales and so many bushels to each farm family to be tagged for domestic consumption and for which the United States Government will guarantee the American farmer that the American market will belong to him and that his product will pay parity price to his pocketbook.

There are a few more than 2,000,000 cotton farmers. That would mean that each cotton farm family could sell five bales of cotton at a parity price of approximately 18 cents per pound.

If there should be storehouses for surpluses, and the Government should build "Joseph granaries" and keep them filled with surpluses from year to year, then allot to each cotton farmer additional bales above the five for whatever amount the granary system would create a demand for.

If beyond this domestic program there are other surpluses, let those surpluses go into the world market to recapture for American agriculture the world market lost under reciprocal trade agreements and under former programs based on the theory of economy in scarcity.

This brings forth another evident truth which is a criticism of the so-called farm bill under consideration. That truth is that it is not the farmer who is producing 5, or even 10, bales of cotton who is creating the surplus on the cotton market. It is the farmer who has driven the tenants from his land and destroyed a community life with machine farming who is overproducing for the American market.

Where once I saw neat school buildings, splendid churches, beautiful and prosperous family farms, and happy farm families, I now see throughout America dilapidated churches, abandoned schools, and rotting farmsteads. Now someone drives out from town in a T-model Ford to drive a tractor from sun to sun and returns to the village at eventide to draw his dollar bill from his employer, the nonresident landowner.

They tell me in the cloakrooms that I dare not vote against a farm bill which might or might not prove of some extremely doubtful benefit to some farm groups. Mr. Speaker, I may lack the political sagacity of demagoguery, but I do not lack the courage to vote my convictions, and as sure as I am a Member of this great body when the vote is taken my vote will be ringing clear. I would to God that when the vote is taken on a bill which in my opinion is in every line an empty mockery to the farmer's need and in every issue an extension of red tape instead of benefit, and in every paragraph a compulsory move to shove the farmer into serfdom, I would that when that vote is taken the no that I shout would reverberate into the four corners of the land to sting the ear of every would-be czar and parasite on American agriculture and to cheer the heart and bless the home of every small and tenant farmer in this great land of ours.

And so, Mr. Speaker, as I conclude I want to say once more that from a heart that belongs to the American farmer, from a mind that knows his problems, and from the depth of my convictions, my answer to this bill is, unless it is basically changed and substantially amended, an irrevocable no. The demagogues whisper that a vote against this bill would cost me votes at the next election. That is an empty

challenge to my determination. I will vote my conviction if it costs me 50,000 votes at the next election.

The whisper that a vote against this bill is a vote against the administration is no argument to deter my action. I hold in high esteem the great, wise, honest, and sincere chairman of the great committee which has produced this bill; I respect the brilliance and capability of our Secretary of Agriculture; and except in instances where my convictions differed with our great President, I have voted with the administration, but on this bill, I care not what the wishes of government administration are. I care only for the hopes and for the welfare of the American farmer. My individual convictions stand adamant. When my name is called my answer will be "No," and though I disapprove of unnecessary slang and my religious convictions oppose profanity, I feel like paraphrasing a much touted Arkansas official and saying no, not only no, but hell, no!

Martin L. Davey, Ohio's Champion Labor Hater

EXTENSION OF REMARKS

OF

HON. JERRY J. O'CONNELL

OF MONTANA

IN THE HOUSE OF REPRESENTATIVES

Friday, December 10, 1937

Mr. O'CONNELL of Montana. Mr. Speaker, under leave to extend my remarks, I desire to point to Gov. Martin L. Davey, of Ohio, as the outstanding example in this country of that class of politicians who can fairly be called "betrayers of labor." No aspirant for high office ever made more complete overtures and assurances to labor than Martin L. Davey when he was running for the governorship. And now, after having joined forces with the brutal Tom Girdler, of Republic Steel, and his associates in turning his National Guard against the workers in the Little Steel strike, with resultant bloodshed and killings, we find this same Martin L. Davey starting his campaign for reelection by labeling as "Communists" the very men whose votes he sought during his first campaign.

There is no dispute as to the facts in this situation. Governor Davey does not dare deny that he sought the support of these steel workers and their C. I. O. leaders and that he gave them unequivocal guarantees that he would use the power of his office to protect the rights of the workers to organize and strike to improve their conditions. He sent emissaries to the C. I. O. leaders in Akron, Columbus, Cleveland, and other cities. He regarded those leaders then in their true role as Democrats actively interested in the reelection of President Roosevelt. These emissaries from Davey told the C. I. O. leaders that he had never used troops in strikes and that "neither money nor influence of any kind would induce him to use them in the future." These latter words are those of John Owens, C. I. O. director in Ohio, a lifelong labor-union man and official of the United Mine Workers.

Even while negotiations were being attempted during the strike Davey publicly expressed his belief that "the steel companies should agree to sign a contract, as a basis of negotiation, and end the strike." In fact, he drafted two different proposals in his own handwriting and submitted them to the union and the Republic Steel Corporation. Philip Murray, chairman of the Steel Workers Organizing Committee, and Mr. Owens, C. I. O. director for Ohio, accepted Davey's compromise propositions. But Tom Girdler and his associates said, "No!" despite the urging of priests, ministers, educators, Governors, United States Senators, Congressmen, and even President Roosevelt himself.

And Davey did what after this? Did he have the strength of character and conviction to stand behind his promises and his compromise proposals? He wavered a short while and then cast to the winds all pretense to trustworthiness. Having ridden into office on President Roosevelt's coattails, he yielded to the blandishments of Girdler, and others, tossed the President overboard, and sent his troops in, ostensibly to preserve order but actually—according to undenied evidence—under secret orders to "break the strike."

He became the undisguised accomplice of the Girdler crowd, who spent nearly $50,000 in May and June alone to purchase 90 riot guns, 2,300 long-range bombs of tear and sickening gas, 325 short-range gas shells, and over 2,000 gas grenades. The ensuing bloodshed and slaughter can truthfully be laid at Davey's door.

No wonder, as he wines and dines with the Girdler menage, that Davey now tries to hide his perfidy behind the name-calling tactics of the ruthless Little Steel plutocrats, who shout "Communist! Communist!" at every sincere effort to improve the lot of the workingman. The falsity of these white-livered shouts is so palpable it needs no exposure to any intelligent American. Davey, the tool of these inhuman and greedy plutocrats, stands as a graphic symbol of the sneering fear which these antisocial forces exhibit as their privileges and power are threatened by the American workingman and his family, who no longer are tricked by such labels as "Communist."

Davey, the oily orator about law and order, is right now faced with a series of scandals in his own State departments because of his barefaced disregard of the law. Consorting with the Girdler plutocrats and their fellows, he hopes that they will furnish enough money for him to buy his way into office next year, and meanwhile he turns a cold shoulder to the pleas of a vast and increasing army of the unemployed for relief. My prediction is that the working people of Ohio will not be duped again by Davey. They will turn him out of office as a disgrace to the American political scene.

Farm Control Bill

EXTENSION OF REMARKS

OF

HON. CHARLES A. WOLVERTON

OF NEW JERSEY

IN THE HOUSE OF REPRESENTATIVES

Friday, December 10, 1937

Mr. WOLVERTON. Mr. Speaker, the underlying principle of this bill is one to which I cannot subscribe. Every word, sentence, and paragraph of the bill seeks to limit the production of basic necessities of life. It is a bill to limit and control what a beneficent Providence would otherwise provide for the welfare of our people. It substitutes the wisdom of man for the wisdom of Almighty God. It would seem that the experiences of the past few years in this respect should be sufficient to teach us once and for all time the utter futility of the power of man to change the immutable laws of Nature. But, undeterred, the administration continues to pursue the same course, by a slightly different method, that has brought distress to our farmers and our people in recent years.

PROVIDES FOR SCARCITY IN FACE OF NEED

To adopt such a course in the face of the statement, so frequently made by the President, that "one-third of our people are ill-fed and ill-clothed" is beyond my ability to understand or justify. Without regard to whether the President has correctly determined the actual number who are ill-fed and ill-clad the fact is undisputable that want and need do exist among a large portion of our people. And yet, notwithstanding this distressing condition the authors of this bill, speaking for the administration, are demanding and insisting that this bill be enacted into law even though the result will be to decrease the amount of available food and increase the price of food to the consumer, thereby making it more difficult, if not impossible, for many of our people to purchase what is necessary to maintain themselves and their families. Therefore, the net result of the

passage of this bill, if it accomplishes what its authors intend, namely, increase the price of foodstuffs, will mean an increase in the number of ill-fed within our borders.

Granting that there is agricultural distress in the sections of our country where this bill will operate, it would seem more reasonable if some method should be adopted that would make the foodstuffs, now alleged to be produced in surplus quantities, available to those in need upon a basis that would provide aid at the same time to distressed agriculture.

NO SURPLUS UNTIL NO HUNGER

The reasoning upon which this bill is based overlooks entirely that the fundamental trouble is not "surplus" of foodstuffs but inability to purchase by those who would like to do so. The surplus now alleged to exist is not based upon quantities beyond ability to consume but upon restricted ability to purchase. There is no real surplus in the true sense of the word so long as there is need or use for the product. And no one who has spoken in favor of this bill has contended that there is a surplus from this standpoint. The so-called surplus arises not from the fact that all have been fed and a surplus remains over and above the need, but solely and entirely because of insufficient purchasing power upon the part of those who otherwise would be consumers.

FREEDOM OF ACTION DISPLACED BY REGIMENTATION

Not only does the bill do violent injustice to the consumer by artificially raising the price he must pay but it also sets at naught one of the basic principles of our American form of government. With the enactment of this bill there will pass the right of farmers who come within its provisions to sow and reap with that freedom that has been their privilege in the past. From the moment this bill becomes effective, from that moment the regimentation of the American farmer is commenced.

A study of the bill will reveal a vast number of details to be complied with by the farmer or severe penalties incurred, all of which have been designed to make control of production of the basic crops effective. There can be no doubt that the farmer who comes within the provisions of this bill is regimented beyond all possibility of free or individual action.

A system or policy that regiments American farmers into a production-control program and makes them liable to severe penalties upon failure to comply with each and every rule and regulation set up in a bureau at Washington, and fills the lands with thousands of snoopers, additional agents, and employees at an estimated cost of several million dollars, not including cost of enforcement and prosecutions, is unreasonable and unjust.

The solution of the problem can and must be found in the application of established American principles.

FARM ORGANIZATIONS RECOGNIZE DANGER AND OPPOSE BILL

It is because thoughtful and serious-minded farmers have seen the danger lurking in the provisions of this bill that no national farm organization is in favor of its adoption and all of them have gone on record against it. This presents a strange situation, indeed, and one that creates serious thought, to realize that the farmers of America, casting aside all the benefits it is alleged this bill would bring to them, have individually, and through their farm organizations, opposed the passage of this bill. They have done so because they recognize that the danger it presents to our American form of government is too great to be taken in exchange for the immediate benefits this bill promises to provide. No finer evidence of true Americanism could be found than that which has prompted the National Grange and similar organizations to take their stand against this or any other form of legislation that directly or indirectly tends to destroy established American principles.

DANGER TO OTHER FARMERS BY INCREASED PRODUCTION OF OTHER CROPS

The reasons I have already given are sufficient in themselves to justify my vote against this bill, but, in addition thereto there is also a very real danger created for every other farmer than those who produced wheat, corn, rice, cotton, and tobacco. This arises from the fact that there is no restriction upon the farmers, who under the provisions of the act take acreage out of production of the crops mentioned, from utilizing such acreage in the production of those farm commodities that do not come within the provisions of the bill. Thus the other farmers of the Nation, including those of New Jersey, would be called upon to meet a competition financed by Federal aid, and with all the distressing circumstances that would follow from increased production of such crops, or what is more than likely the acreage taken out of production, under the provisions of the bill, unless amended before final enactment, would be turned into the production of those crops that would enable such farmers to engage in dairying. This great industry already solely pressed as a result of foreign importations, which are constantly increasing and have reached an alarming figure, would become so distressed that no one could adequately picture the consequences.

FAILURE TO HOLD HEARINGS

It is regrettable indeed that notwithstanding the need for adequate farm relief that the administration has utterly failed to present a measure that merits support. In some measure this may be due to the fact that no opportunity was given in either Senate or House for anyone to appear before the respective Agriculture Committees to present the viewpoint of the farmers or the organizations that represent them. There should have been public hearings with full and free opportunity given to discuss the provisions of this bill and to suggest other and more desirable methods. I am convinced that if this had been done and the committee had been willing to give consideration to the views that would have been presented there would be a far different and much better bill before the House today.

FARMERS WANT SENSIBLE NOT FANTASTIC LEGISLATION

It is my opinion that farm-relief legislation should be drawn more in conformity with the thought and desire of real farmers instead of giving so much attention to theorists.

All sorts of fantastic schemes have been brought forward as a cure-all. Some have been tried with disastrous results; some so inherently weak were discarded after short trial; some were abandoned because of an aroused resentment upon the part of the consumer and producer; some were outlawed by the Supreme Court; and now with an assurance that is amazing, in view of past failures, the administration presents this bill as a remedy, although it does not have the endorsement of a single national farm organization.

I was greatly impressed with the action taken by the National Grange at its recent annual session at Harrisburg, Pa. The delegates adopted a farm program of such merit that it should have had the serious consideration of the administration before it presented the present farm-control bill to the House. The program of the National Grange, among other suggestions, provided:

First. Give the American farmer equality of opportunity and a chance to obtain a fair share of the national income.

Second. Permit no legislation to be enacted which will result in either immediate or eventual regimentation of the American farmer.

Third. Restore the American market to the American farmer to the limit of his ability to produce efficiently, with no curtailment of crop production that will place him at a disadvantage; limiting imports to those products which he cannot supply; and guaranteeing equal protection with labor and industry under the tariff, with speedy repeal of reciprocal-trade treaties that prove harmful.

Fourth. Continue the soil-conservation program to help the farmer improve his land and diversify his crops, but not as a means toward production control.

Fifth. Insist that with crops of which there are exportable surpluses and for which marketing agreements are undertaken the program shall be adopted only after vote of farmers affected, with complete control remaining in their hands. Reasonable commodity loans based on warehouse receipts to be made available to assist in orderly marketing.

Sixth. Balance the Federal Budget and insist upon economy and efficiency in local, State, and Federal Governments; eliminate and forbid duplication of public services; protect the taxpayer and always keep in mind that for everything asked from the Government the taxpayer must settle the bill.

(7) Foster cooperation and good will between government, labor, industry, and agriculture; build confidence so that recovery may go forward, the wheels of industry may turn faster, more people be employed, and greater consuming power be created.

Such a program as above outlined if put into effect by appropriate legislation would give far more promise of real relief and aid to distressed agriculture than all the fantastic legislation heretofore, nor, or hereafter presented.

What American agriculture needs today is a permanent, well-considered, and thoughtful program, based upon study and experience, instead of some makeshift or vote-catching proposal that cannot result in the permanent rehabilitation of agriculture.

1937 Farm Bill

EXTENSION OF REMARKS
OF
HON. HERRON PEARSON
OF TENNESSEE
IN THE HOUSE OF REPRESENTATIVES

Friday, December 10, 1937

Mr. PEARSON. Mr. Speaker, having a district largely agricultural in its nature, I have been watching closely the attitude of all Members of Congress toward legislation which was calculated to promote the welfare of the agricultural interests of the Nation. I am today convinced that there are not a dozen Members of Congress who are unwilling, for selfish reasons, to actively support legislation which they believe is wholesome and beneficial to those who earn their livelihood by farming. Without a doubt they all realize and appreciate that their constituents, even though they be industrialists and city dwellers, are vitally affected by the prosperity or adversity of the industry which points the way in our economic life—agriculture. They consider it, as they should, from a national standpoint, and permit the common good of all to outweigh the imaginary disadvantage which a minority group at times advance. It is true that many of them oppose certain types of farm legislation, but the opposition is not born of selfishness. It is due to honest misgivings as to the wisdom of the proposed law. Under such circumstances, no one is to be censured for his position, no matter how much we may differ with him in his conclusions.

If I am correct in these conclusions about the attitude of Congress and its Members what has agriculture to fear as to its treatment at the hands of Congress? There need be no fear provided the farmers of America, individually and through organized groups, let Members know what they really need and want, and provided further that these expressed needs and wants are not unreasonable and inconsistent with the lawful authority of Congress to grant. Up to this time I know of no such unreasonable requests being made.

Congress, during the last few years, has meant more to agriculture than ever before in history. We are just emerging from an era of economic disaster, world-wide in its effects which has turned the faces of the people of every civilized nation to their central governments for aid. Local and State governments have been impotent in this great crisis and we have learned that this great Government which fosters and protects our rights and liberties is not too great to aid the least of our citizens and not too small to protect the greatest of them. No one has been denied aid. Our great financial institutions, railroads, industries, home owners and the underprivileged, unemployed, and helpless people in every State in the Union have had thrown around them the strong arm of protection and security of the Federal Government. One of the sickest and most desperate of them all was agriculture and those engaged in it were reduced to the lowest economic level in this generation.

Congress alone had the power to do something to meet this unprecedented emergency. Legislative processes had to be resorted to in order to provide funds to meet the needs and to authorize their expenditure. How hard Congress tried to remedy the situation and how well it succeeded is now history. As a result of the appeals of agriculture for help and the efforts of Congress to answer the appeal the two have become intimately identified and the interest of the individual farmer in the Congress, the work it does, and in the attitude of his own representative in that body has become decidedly personal.

There has been much criticism of the last Congress on account of its failure to enact permanent farm legislation. The criticism has become more intense since the recent disastrous collapse in the market prices of farm commodities, and I am willing to concede that there is some justification for the criticism. I think, however, it is fair to Congress to say in its defense that the failure to enact such legislation was not due to indifference, lack of interest, or lack of effort. The committee worked for weeks in an effort to report a suitable bill, and I think its failure to do so is directly attributable to two causes, namely, the inability of farm leaders and farm groups to fully agree among themselves as to what they wanted, and, secondly, honest differences of opinion among Members of Congress as to what was best to do. The passage of a bill affecting the rights and privileges of all of America's 130,000,000 people, and adopting a permanent policy calculated to control the production of five of America's major crops is no small task and one that requires time and thought. It should be done in 8 months, but other suggested legislation pending in the last Congress, far reaching in its effect, served to create a legislative jam for months and prevented favorable action on many deserving bills which no doubt would have been enacted into law. I fear that the Agricultural Adjustment Act of 1937 was one falling in that category. Whatever the cause of the failure of Congress to take action on this vital need I know that those of us who were interested in obtaining action did all that could be done consistently to get an acceptable bill before adjournment.

In spite of this indictment against the first session of the Seventy-fifth Congress, there is much to be said about what was done for the farmers during the session and for which it is to be commended. I have the authority of a Member of the House of Representatives for 20 years for the statement that more beneficial farm legislation was passed this year than was ever enacted in a single session of Congress. There is ample proof of the truth of this assertion.

The paramount question now is, What legislation shall Congress enact for the relief of agriculture? It is the answer to this inquiry that we are seeking.

The lesson immediately before us and most vivid in memory perhaps is the one recorded in 1932. None of us have forgotten it. Cotton, 5 cents per pound; corn, 20 cents per bushel; hogs, $2.75 per hundredweight; and tobacco, wheat, and rice proportionately cheap. Mortgages in arrears, taxes unpaid, needed improvements left undone, families poorly provided for, and the year's work brought to a close with nothing to show for our efforts except deficits. We were in want in the midst of plenty, and we realized that a dearth of production without a corresponding demand or need for what we produced destroyed our chances for profitable farming.

The following year under Government leadership a million southern farmers cooperated in a program to reduce the production of all farm commodities, and particularly cotton, and for once knew from personal experience just what they could do for themselves by working together. After enjoying the fruits of this experience in the form of better prices, 9 out of every 10 cotton farmers took part in the adjustment programs of 1934 and 1935. The provisions of the Bankhead

Act and the A. A. A., with their control features, doubled the farm income of 1932. We enjoyed a greater consumer demand with adjusted production and our annual carry-over of cotton was reduced to about normal proportions. Cotton prices ranged from 11 to 14 cents, and other commodities sold at a like ratio.

In January 1936 the Supreme Court invalidated in part the A. A. A., and once again Congress had to devise some means of maintaining the progress which had been made under the several farm programs. It was necessary to act in time to protect the crops of 1936 if possible, and within 60 days after this decision was rendered the Soil Conservation and Domestic Allotment Act was passed. It was hoped that this law would accomplish the dual purpose of restoring soil fertility and reducing the production of cotton, corn, wheat, and tobacco. It authorized financial benefits to those who would forego producing soil-depleting crops and planting instead soil-conserving crops. No processing taxes were imposed and the expense of the program had to be borne out of the general funds of the Treasury. Congress authorized such expenditures each year.

The soil-conservation program was a voluntary program, and therein lay its weakness. Under its operations in 1937 the acreage planted in cotton increased about 3,000,000 acres and, as we come to the harvest season, we find the prices of our farm commodities showing every sign of reverting to 1932 levels. It appears now that on 34,000,000 acres we will make eighteen and one-quarter million bales of cotton—an average of better than 250 pounds of lint cotton to the acre. This is the biggest yield per acre in history. It is the repetition of the lesson taught us 5 years before, and from which we learned that a reasonable control of production constituted a cure for the trouble.

Using cotton as a typical commodity and one which is affected by and affects the markets of the world, what is our situation today?

We have increased production both in the United States and abroad. We have increased consumption both in the United States and abroad but even with the increase, domestic consumption totaling 8,000,000 bales and foreign consumption 23,000,000 bales, we will have a carry-over next year of about 9,000,000 bales, and a world carry-over of approximately 18,000,000 bales. Foreign consumption of American cotton this year is off a million bales, or down to about 5,300,000 bales. The market price has gone from 14 cents to around 7 and 8 cents.

Now, with full knowledge of the facts I come back to the question: What legislation shall Congress enact for the relief of agriculture?

To parry for a moment and argue the question further I would say such legislation as will provide the best way for the farmer to get the best price for what he produces. Just what that way is I cannot say beyond peradventure but I do know that so far as we have gone in our legislative experience we are bound to have observed that limited control of production has gone a long way toward achieving that objective.

It is well to note the different results obtained through a control program with penalties attached for noncompliance and those obtained through a voluntary program. We are driven to the conclusion that a limited control of production of cotton, corn, wheat, rice, and tobacco through legislation that will require and enforce cooperation of producers is of sufficient merit to challenge the attention of Congress and worthy of its consideration.

I realize that the greatest argument against such a program lies in the fact that we have a constantly increasing production of cotton abroad and that in reducing our own production we encourage other countries to continue increasing acreage and run the risk of losing our foreign markets. This argument has its merit but is subject to many answers. Foreign production has been increasing for many, many years—long before we started decreasing our production. We cannot stay this trend unless all producing nations would agreed to enter into mutual compacts whereby a proportionate reduction in acreage might be effected throughout the world. In the absence of such a plan it is a factor over which we have no control.

The Agricultural Adjustment Act of 1937 now pending is in part a control bill. It seeks to revive some of the features of the A. A. A., with added emphasis on balancing the good and bad years through the ever-normal granary and is definitely the type of legislation which the farmers themselves are beginning to demand.

I believe they have learned in their bitter experiences that only through cooperative and mutual control of production can they get away from the evils of "small crop, high prices, bumper crops, low prices." They seem to concede that they need protection from their own human weaknesses if they hope to stabilize income and escape the lean years which come all too frequently.

Whether we suffer from overproduction or underconsumption is a mooted question which is debated year in and year out. The answer is not certain but of one thing everyone is certain—the American farmer can and does overproduce. We know that with our broad and productive acres, farm mechanization and intensive farming methods that all of our markets can and do reach the saturation point and with that saturation comes the inevitable slump in commodity prices. This has happened repeatedly. Warnings have not stopped it and each year spring time optimism becomes sordid disappointment at harvest time.

The admitted objectives of the pending bill are parity prices for the commodities affected, ever-normal granary, control of surpluses, and conservation of the soil, all of them are to be devoutly desired and it is for us to decide whether or not we want to accomplish them in the manner suggested in the pending bill.

I stand ready to support legislation which I believe will accomplish this result and I hope that the Congress of the United States will by reason of its efforts to help American agriculture stand vindicated before the bar of public opinion.

We have spent 2 weeks in open discussion of the bill which is to be acted upon today. Some very material and damaging amendments have been adopted by the Committee which I earnestly hope will be eliminated by a vote of the House. I doubt if we will succeed in passing a bill which will be acceptable to all agricultural interests alike and frankly there are some provisions in this bill which I would like to see changed or modified. Provision has been made for the small producer and some of the injustices which come into existence under former farm legislation have definitely been eliminated under the terms of the pending bill. I realize that all legislation as far reaching in its effect as this must be accomplished through compromise hence in spite of some objectionable portions of it I shall support it because I think it will accomplish some good for 30,000,000 people engaged in the Nation's greatest basic industry.

The Farm Bill—I Favor Supplemental Legislation to Benefit the Dairy and Poultry Farmers

EXTENSION OF REMARKS

OF

HON. MARTIN F. SMITH

OF WASHINGTON

IN THE HOUSE OF REPRESENTATIVES

Friday, December 10, 1937

Mr. SMITH of Washington. Mr. Speaker, I am voting for this legislation because it is the best that is offered and that can be secured under the present circumstances. I am far from satisfied with some of its provisions and omissions. However, the measure meets with the approval of President Roosevelt, the chosen leader of the Nation and the leader of my party, and I feel confident that he will recommend to Congress such changes, modifications, and additions as experience will prove to be necessary and advisable.

DAIRY AND POULTRY INDUSTRIES

Mr. Speaker, I voted for the Boileau amendment to safeguard the interests of the dairy industry in the Committee of the Whole and have again voted for it on the roll call in the House, when it was adopted by a vote of 202 to 188. In my opinion, the dairy farmers are justly entitled to the protection contemplated by the Boileau amendment. I trust that in the near future the Committee on Agriculture will consider and report favorably legislation which will further benefit the dairying and poultry farmers, who are deserving of consideration and assistance the same as the cotton, tobacco, corn, wheat, and rice farmers who are included in this bill. I realize that reasons have been advanced why the dairying and poultry farmers have not been included within the purview of this legislation, but I strongly dissent from the viewpoint which has been expressed. I will gladly join with my colleagues to have the interests and welfare of the dairying and poultry farmers provided for in future farm legislation, which should by all means be brought before Congress in the regular session.

H. R. 3144—EXCISE TAX ON EGG PRODUCTS

Mr. Speaker, I favor the early enactment of H. R. 3144, introduced by the gentleman from California [Mr. LEA] to amend section 601 of the Revenue Act of 1932, as amended, to provide for an excise tax on egg products. This legislation would materially assist our important domestic poultry industry in successfully meeting foreign competition, particularly from China, as over 90 percent of our egg imports at the present time come from China. Mr. Speaker, I am unwilling to subsidize the Chinese at the expense of our own poultry farmers, many of whom reside in my district in southwest Washington. My constituents maintain high wage and living standards which render it impossible for them to compete with the eggs produced more cheaply in China, and I therefore strongly favor the early enactment into law of H. R. 3144 to protect the interests of the thousands of American citizens who are engaged in the egg and poultry industry and constitute an integral branch of American agriculture.

How the Deane Plan Will Help the Farmer—Why the Farmer Should Support the Deane Plan (Embodied in H. R. 1620)

EXTENSION OF REMARKS

OF

HON. C. ARTHUR ANDERSON

OF MISSOURI

IN THE HOUSE OF REPRESENTATIVES

Friday, December 10, 1937

Mr. ANDERSON of Missouri. Mr. Speaker, the following discussion should be considered from the standpoint not of a farmer but of farmers as a group.

What conditions do farmers require in order to be assured of opportunity for economic prosperity?

First. They must possess land of sufficient productivity so that by the application of their intelligence and labor they can produce a sufficient quantity of products which, at the price at which they can be sold, will enable them to purchase sufficient products, which they cannot personally produce, to assure them a standard of living comparable to that available to those of equal ability and industry in other lines of endeavor.

Second. There must exist a consistent and adequate demand for the products of their enterprise sufficient to absorb their maximum production at such price.

Before discussing the implications of these two major requirements for the farmers' economic security, it may be well to set forth the attitude of farmers toward their profession. Perhaps the fundamental characteristic of farmers as a class is their desire for independence, and next, is the feeling of security inherent in wresting their living from the soil. This feeling of independence is possible only under free competition, where they are enabled to pit their industry and intelligence, as individual human beings, against the industry and intelligence of others. But such opportunity for the exercise of individual initiative entails a corresponding individual responsibility for success or failure, barring, for the moment, natural hazards of drought, flood, and other so-called acts of God.

In other words, if success is the result, not of individual initiative, but of political or other arbitrary action, the feeling of individual independence disappears.

Therefore, in order that farmers may secure the just rewards of their intelligence and industry under free competitive conditions, they must be assured that there will be no arbitrary interference with the automatic elimination, by competition, of those farmers who are unable to produce by their labor a satisfactory livelihood. Otherwise, the intelligent and industrious farmer loses the security which he demands.

The element of security, therefore, can only be assured provided there exists some automatic means of absorbing elsewhere into our economic life those individuals who are unable, competitively, to secure a satisfactory livelihood on the farm. If such a means of absorption of the unsuccessful farmer into other lines of endeavor were available, there would remain on the farm only those individuals whose industry and intelligence, when applied to basically satisfactory physical farming conditions, rewarded them with a satisfactory standard of living.

To insure such conditions our economy must be so organized as to provide two requisites for the farmer. First, the largest possible demand, at a satisfactory price, for his products. Second, the automatic absorption into other lines of pursuit of the so-called marginal or unsuccessful farmer.

Our economy may be divided essentially into only two main groups, namely, agriculture and industry—industry being defined as embracing trade, transportation, and practically all activities aside from agriculture. Therefore we must look to industry to provide the farmer with both the largest possible demand for his agricultural products, and for the removal from the soil and the absorption into industrial activities of the submarginal farmer. And the paramount interest of the farmer lies in insuring that industry shall function for his benefit in these respects. Fortunately there is adequate proof that industry can so function once we adopt a practical and automatic method of functioning. This is because the unfulfilled desires of our people for industrial products—including services—are so far from being filled, that in spite of the rapid technological and scientific advance that has been made and is being made, the opportunity to expand industrial production is unlimited for all practical purposes. And such necessary expansion will be promoted to the extent that we find the means of automatically distributing such production, on a basis that will place the requisite purchasing power in the hands of those who desire and will consume the goods and services produced.

While agriculture likewise is expansible, for it is quite evident that great masses of our population today do not have even proper food and, further, that scientific advance is gradually teaching us how to utilize, to a greater and greater extent, farm products in industry, nevertheless, with the proper distribution of purchasing power among the mass consumers of the Nation, we might eventually reach the saturation point for agricultural products—certainly for food products. This possibility is evident from an analyzation of the proportion of total income spent for food by those in various income brackets. The higher the income the lesser the proportion spent for food. In other words, the first expenditure from our income must be for sufficient food to sustain life, after which expenditures increase for foods that provide an enjoyable, healthful, and appetizing diet. After these are once secured an increase in the income of the individual does not importantly increase his expenditures for food, but it does expand the demand for all types of industrial products, both goods and services.

Under the Deane plan the conditions just described as prerequisite to the farmers' prosperity would be assured on a sound economic basis. These conditions would be created by sustaining at all times the highest possible demand for the total production of the Nation, both agricultural and industrial. Through the adoption of accurate indexes of current and long-time average production, the Nation would know immediately whenever any maldistribution of purchasing power was creating a condition where effective purchasing power was inadequate to sustain a continuation of maximum production. Immediately this condition was known, an automatic distribution, on the broadest possible base, would be made from a central reserve fund so as to supplement declining purchasing power and thus insure its adequacy to cause a continuation of maximum production. This reserve fund would be replenished from a tax on industrial pay rolls in times of prosperity when the reverse condition was found to exist; that is, when purchasing power (demand) was greater than current supply (production), which would be reflected in rising prices which would initiate a reduction in effective demand.

By sustaining production at the highest possible economic level, the Deane plan would automatically sustain a demand for labor in industry with sustained wages, thus providing those conditions necessary to induce the transfer of submarginal or unsuccessful farmers into industry at wages sufficient to provide a standard of living for which they had unsuccessfully striven on the farm.

These prerequisites for the prosperity of the intelligent and industrious farmer would be secured automatically under the Deane plan without any arbitrary restrictions by legislation, or otherwise, on prices, hours, wages, and so forth, which restrictions obviously are abhorrent to him because they destroy his independence.

It is often stated that the problems of the farmer cannot be considered solely from the standpoint of economics; that farming is a "way of life" and that even under the worst conditions there is a security to be found on the land which is not present in industry, and which is, to some extent, at least, a compensating factor. Let us analyze this contention for a moment. When we talk of security on the farm what we really mean is that with a minimum of intelligence and labor it generally is possible to sustain life from the land, whereas in industry, if a worker is thrown out of a job, he may have no way of sustaining life in the absence of charity or relief. This is, of course, true at the present time. But can we accept as a premise for any method which we may adopt to secure the well-being of our population as a whole the fact, first, that Americans can or should be satisfied with a bare subsistence standard of living, and second, that there is anything inherent in industry making it impossible to provide the same security for those engaged herein as on the land; which, in the final analysis, simply means continuity of employment and income? Certainly no one can have any quarrel with the individual farmer who is so enraptured with farming as a "way of life" that he is satisfied simply to sustain life from his labors. But, assuming that at least some of those who are now on the farms, living on a bare subsistence level, would prefer to trade a higher standard of comfort for such "way of life," we should, at least, adopt every possible means to permit a free choice to be made by each individual.

Under the Deane plan such choice would be available and, based on our experience during the war and during other past periods of industrial prosperity, when there was a strong demand for labor, we might reasonably expect a large number of submarginal farmers to make their choice in favor of a job in industry. In some of these past periods the influx of workers from the farms to industry, in order to secure a higher income, was so great that the "reformer," who seldom is interested in the independence of the individual, demanded arbitrary action to prevent it. But recognizing that red-blooded Americans always desire independence of action, then the least that can be done is to afford them the opportunity of choice. What choice they make then becomes their problem.

We can all have sympathy for a farmer who works intelligently and industriously and finds at the end of the year that when he disposes of the products of his labor the proceeds are entirely inadequate to provide a decent standard of living. And we can understand his willingness to support any scheme that will result in the supplementing of such inadequate income, through Government subsidy or otherwise, so as to permit of a satisfactory living. And as long as we disregard the economics of the problem and attempt to meet it on an emergency basis for this group or that group, we will continue to build arbitrary restrictions into the functioning of our economy as a whole, pitting group against group and class against class. And the political implications of such policies of expediency eventually may be disastrous to our democracy.

Now, it does no good to quarrel with the adoption of emergency methods. If a man is starving, he must be fed, even though it may be more constructive to eliminate the conditions which cause him to starve. But certainly we can approach the problem from the standpoint of adopting, for our economy as a whole, some governing device that will assure the automatic economic distribution of the largest possible production of both agricultural and industrial products. And of providing the same relative security in industry as, in theory, is found on the land. Only by so doing can we provide the highest possible standard of comfort and well-being for all of our population. In other words, our problem is to prevent the fire, quite as much as to put it out once it starts. We must adopt some basically sound economic mechanism that will eliminate emergencies. By so doing we automatically will eliminate unsound emergency methods, as well as the recurring destruction of values and morale and the physical and mental distress which flow from a lack of a stabilized economy. The Deane plan would provide such an economic mechanism and because, inherently, industry, which must provide the market for agricultural products, as well as a means of absorbing the submarginal farmer, is the really expansible part of our economy. Farmers, more than any other class, would benefit from its adoption.

As an example, let us take the arbitrary restriction of agricultural production and the levying of processing taxes, with which we shall not quarrel as emergency means. But as a permanent cure they are no answer at all. Let us carry them to their logical end and see what would happen to our economy as a whole. We need for the health and well-being of our people today a much greater production of foodstuffs than we are producing currently. This is quite evident from the undernourished condition of millions of our population. The reason this large portion of our population is undernourished is because they haven't the purchasing power with which to buy proper and sufficient food. They require either increased purchasing power or lower prices so that their present purchasing power will secure more and better food. Yet what have we done to meet the emergency? We have restricted production, although more is needed, and through the processing tax we have raised prices although lower prices are needed. Why have we done this? Because the purchasing power of industrial workers is so low that it cannot supply an adequate demand for agricultural products at satisfactory prices that enable our farmers to secure a satisfactory standard of living. But by adopting the emergency measure that has temporarily benefited the farmers, we have reduced the effective purchasing power of that very group to whom the farmers must look as the consumer of his products. This is certainly uneconomic and if persisted in is bound to lead, in a constantly narrowing circle, to the lowest possible production combined with the highest possible price, resulting in the lowest standard of living for our people as a whole. How much more constructive it would be to insure continuous and adequate purchasing power in the hands of the farmer's customers sufficient to call for the highest possible production of agricultural products at the lowest possible price that will yield the farmer a satisfactory reward for his intelligence and labor.

It is equally true that any artificial emergency measures applied to industry which cut production and hold up prices

work to the economic disadvantage of farmers. For instance, the support of millions of our population by the Government on essentially nonproductive enterprises works exactly in this way. This is not to argue that the Government should not take care of our otherwise unemployed, but such steps can only be justified on the basis of an emergency, and if persisted in will lead to economic disaster for the Nation as a whole. We must, of necessity, find a way to increase agricultural and industrial production and to lower the prices of such production in order to enable the farmer as well as those in industry to secure the largest possible quantity of the material satisfactions of life from the labor he expends.

It is inevitable that the good sense of our people will cause them to disregard the erroneous theory that there is not sufficient work for everyone willing to work in the production of all those products and services, agricultural and industrial, which provide a constantly improved standard of living. We must eventually tackle our economic problems from the standpoint of methods that assure maximum production by automatically providing for its economic distribution. The demand for our total production cannot exceed the purchasing power in the hands of those who want the goods and services produced; and the economic distribution of our total production, or purchasing power, requires that it find its way into the hands of those who demand and will consume such production.

Such automatic distribution would not be at the expense of those who have accumulated worldly goods, because the value of such producers' goods depends on their earning power, which in turn depends upon their utilization. A factory is of no value unless there is demand for its products. A farm is of no value unless there is a demand for its products, except for the one fact that life can be sustained on a piece of land and not in a factory. Therefore, as the value of accumulated property—producers' goods—depends upon a demand for the goods and services it produces, it is to the economic advantage of the owners of property to see that such demand is consistently sustained. And this applies directly to the owners of farms.

Postmaster General Farley's San Francisco Address

EXTENSION OF REMARKS

OF

HON. JAMES M. MEAD

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Friday, December 10, 1937

ADDRESS OF THE HONORABLE JAMES A. FARLEY, POSTMASTER GENERAL OF THE UNITED STATES, BEFORE THE ANNUAL CONVENTION OF THE NATIONAL ASSOCIATION OF POSTMASTERS, SAN FRANCISCO, CALIF., TUESDAY, OCTOBER 19, 1937

Mr. MEAD. Mr. Speaker, under the leave to extend my remarks in the RECORD, I include the following address delivered by the Postmaster General before the annual convention of the National Association of Postmasters at San Francisco, Calif., Tuesday, October 19, 1937:

I am delighted to be in California again, and appreciate very much the invitation of your national officers to attend this convention of the National Association of Postmasters. You have a splendid organization and I congratulate you most heartily on the progress you have made. I also want to congratulate you on the fine attendance. You are here at your own expense, and many of you have come a long way, which indicates that you have more than an ordinary interest in postal affairs.

Meetings of this kind are of great benefit to the Department and to the postmasters. They enable all concerned to come to a better understanding of the problems to be met—and when men and women who are engaged in the same profession or business fully understand each other's difficulties, they are more tolerant and less inclined to magnify their own local problems.

We are all engaged in a great public service that is of vital interest to every citizen of the Nation. It was organized for the public good, for the dissemination of information, and principally for the transportation and delivery of mail matter. Its founders contemplated that its benefits should be offered on an equal basis to all. Throughout the history of the country that fixed policy has been maintained by all administrations of the Government. In the course of its development the Postal Service has taken on other activities to meet the increasing demands of the population.

I think every American has a justifiable pride in the Postal Service of the United States. Everyone connected with the Service seems to become imbued with the importance of its position in the affairs of the Nation, envious of its reputation, and intensely interested in maintaining its prestige. I can say in all frankness that in my whole experience in public and private life I have never been associated with an organization or activity which has brought me so much personal pleasure as I have found in the position of Postmaster General. I am deeply grateful to the President for the opportunity he has given me to serve as your chief during the past 4½ years. I also want to publicly express my sincere appreciation and heartfelt thanks to my splendid departmental staff in Washington, the inspectors, postmasters, supervisors, clerks, carriers, railway postal clerks, rural carriers, and all others connected with the Service, for their uniform courtesy and fine loyalty to me and to the Department.

Obviously all of the good and all of the progress in the post office is not confined to the term of this administration. I fully appreciate the splendid accomplishments of many of those who have served in the past, and you and I owe them a debt of gratitude. The Department has been built on a firm foundation and its progress has been steady, so I say again in all sincerity, "Many thanks to those who have gone before us."

When I came to the Department in March 1933 I had no preconceived notions with respect to the Postal Establishment. Neither did I have a desire to inaugurate revolutionary policies. I did, however, have the purpose to maintain a businesslike administration of this tremendous business Department of the Government. Having come from business, I naturally felt that an institution which sold its services in the main for hire should receive in revenues a sufficient amount of money to pay its expenses. I did not then, and do not now, have any thought of making a profit out of the Postal Service. The people do not expect the post office to be a money-making institution, but I am convinced that the average citizen agrees with me that it should pay its way.

Upon assuming charge of the affairs of the Department, I appointed as my assistants men in whom I had every confidence, and whose loyalty could not be questioned. We then brought in a group of experienced postal people in whom we had equal confidence. After setting up this administrative organization in the headquarters at Washington we assigned some of the most experienced inspectors in the Service to make a careful and painstaking survey of the Department itself and of the field operations. When full and complete information was secured, I set about to continue and make more effective the many good things that were being done, and to discontinue unnecessary activities and wasteful and overlapping methods.

We found that the organization of the Department was sound. The headquarters were organized into four separate and distinct bureaus, each operating under an Assistant Postmaster General. In order that proper classification could be made of expenditures, and to insure a clear-cut separation of administrative responsibilities, the appropriations of the Department were set up separately for the several bureaus.

In addition to the four bureaus which exercise administrative control over the field services there had also been set up a Bureau of Accounts, under the Comptroller; an investigation force, under the Chief Inspector; a law department, under the Solicitor; and a purchasing department, under the purchasing agent. Insofar as the general policies are concerned, the several bureaus and departments were coordinated by the Postmaster General. This organization is similar to the plan followed in the general conduct of most large concerns, and to a modified extent it is carried out in the organization of the larger post offices. We have made no change in the basic organization of the Department and have added no bureaus.

The country had just passed through a major depression which had its effect on the postal business, as well as on all other business. Revenues were down, mail volume was down, which resulted in an overmanned condition through the Service in almost all of its branches. You well know how that situation was handled. I had the option of ruthlessly dismissing from their positions thousands of junior employees, many of whom had family responsibilities, or of spreading the burden by ordering payless furloughs throughout the Service. As you know, I adopted the latter method to tide us over the period of reconstruction of our field organizations. I also adopted the policy of retiring on pension several thousand senior employees who could properly be relieved of active duty after 30 years of service.

In an amazingly short time the President, with the aid of Congress and the people generally, brought about a restoration of business that greatly improved conditions in our Service. When receipts began to pick up and mail volume was restored furloughs were discontinued and all of our regular employees were restored to full-time work and full pay. However, we still had the question of unemployment for the substitutes, thousands of whom had been on the rolls of the Department in the various cities for a great many years. Their situation was most distressing, but we felt that our first duty was to the regular employees who had served longer—but I firmly resolved that at the first opportunity something would be done to provide employment for those substitutes. I did not

feel, however, that it was fair to the general public to place them on the regular pay rolls until such time as we had real need for their services. Just as soon as the income of the Department showed a steady increase and there was assurance that our business was definitely on the upgrade, I gave my approval to the shorter workweek law, which provided thousands of additional jobs and in the main solved the substitute problem.

During the trying days of 1933, when strict economy was essential, we kept before us the need for maintaining the Service at a high standard of efficiency, and second only to that we thought constantly of the welfare of the employees. To me it seems these two things are inseparable. Good will of the patrons and good will of the employees are almost on a parity in determining policies to be followed in the management of either public or private business. I think I can say without fear of contradiction that the Postal Service is more efficient today than at any time in its history and that the employees are better satisfied.

Success or failure in business is determined primarily from a consideration of its financial balance sheet, therefore I am going to call to your attention our progress in that respect.

During the fiscal years from 1927 to 1932, inclusive, there had been constantly growing adjusted or net postal deficits, ranging from more than $26,000,000 in 1927 to more than $153,000,000 in the fiscal year 1932. The postage rate on first-class matter was increased from 2 cents to 3 cents at the beginning of the fiscal year 1933. The previous administration had charge of the affairs for 9 months during that fiscal year, and in spite of the increased postage rate the net deficit for the fiscal year 1933 was more than $48,000,000. We recommended to the Congress and secured a reduction in the local first-class rate from 3 cents to 2 cents, which became effective July 1, 1933, and thereby gave up approximately $17,000,000 in postal revenues in the fiscal year 1934. Notwithstanding this loss in revenue we finished that fiscal year, which was the first full year of operation under this administration, with a net postal surplus of more than $12,000,000. It was also during the fiscal year 1934 that we took over the maintenance of public buildings from the Treasury. In the fiscal year 1935 a net postal surplus of nearly $5,000,000 was accomplished. In the fiscal year 1936, which was the year that the shorter workweek law became effective, the net deficit was approximately $17,000,000.

When I left Washington the final audit of the accounts of the Department for the fiscal year ended June 30, 1937, had not been certified by the General Accounting Office. I do know, however, that the postal revenues for the last fiscal year were approximately $726,000,000—the largest in history and about $60,000,000 in excess of the gross receipts for the fiscal year 1936. I can say to you with full confidence that when the final audited figures are received, I anticipate a net operating surplus of several million dollars will be shown. The accomplishments then from strictly a financial viewpoint during the period from March 1933 to June 30, 1937, have been most satisfactory.

To some it may seem that if the management of the Post Office Department can show a net surplus of several million dollars it is time to consider reduction in the first-class rate for out-of-town mail. However, I would advise against such action. We have done much to improve the service. We have strengthened and made more effective its facilities, but in view of the drastic changes that are being made in transportation throughout the Nation, and the need for greater speed in the handling of the mails all along the line, the Department could properly spend many more millions in service improvements, and will probably be faced with the necessity of making such expenditures in the near future. We have done much to improve the condition of the employees, and to make the postoffice a better place in which to earn a livelihood; but we have not yet done everything for our employees that we can and should do for them when the funds are available from the revenues.

I am of the opinion that the 3-cent rate on first-class matter for out-of-town delivery is reasonable. There is no other service in America that offers the unlimited possibilities of communication that are offered by the letter service in the post office. Most citizens appreciate that fact. Careful observation and full consideration of all phases of the situation lead me to the definite conclusion that the 3-cent letter rate should stand until such time as we have accomplished all service improvements that are necessary and until such time as we have established the Postal Service as the ideal employer of labor in America.

We have directed our efforts to both increased revenues and the reduction of expenditures. By stimulating interest in stamp collecting, the sale of stamps to collectors through the Philatelic Agency in the Department has shown a marked increase and has now reached the high total of $2,000,000 annually.

By exercising better supervision over the use of car space on the railroads, several million dollars have been saved during this administration.

Since 1933 the Department has consolidated several thousand rural routes and effected a saving of nearly $8,000,000.

Several million dollars have been saved in the cost of operating the motor-vehicle service.

The air mail, both domestic and foreign, is in the highest state of efficiency in its history. Contractors are using the finest and safest planes available. This high-speed service has been extended to many cities and States, and the cost of operation has been materially reduced. Foreign air mail has been established from this great city of San Francisco across the Pacific; the air lines of Alaska have been extended; air mail has been provided for inter-island service in Hawaii; and in the near future we will have trans-Atlantic air mail operating between the United States and Europe. Mail is being flown to the South and Central American countries, to Canada, Mexico, Cuba, Jamaica, Nassau, Puerto Rico, Haiti, and the principal islands in the Windward and Leeward groups.

Congress has provided funds for about 1,400 new post-office buildings. More than 800 have been completed or are in course of construction, and the remaining projects will be under contract within a short time. Every State, Territory, and insular possession has shared in this building program.

We sell United States savings bonds for the Treasury.

We delivered the bonus bonds and handled the cash payment of those bonds to the veterans.

We registered 29,000,000 workers for the Social Security Board and are now undertaking the distribution and collection of questionnaire forms in connection with the census of the unemployed.

All of these things have been accomplished quickly and efficiently due to the fine loyalty and industry of you postmasters and all others connected with the Service. You should be proud of the record you have made, and I have every confidence in your ability to carry on, even to the attainment of greater accomplishments. In that connection I want to present for your careful thought and consideration the following excerpt from the President's message to Congress transmitting the report of his Committee on Administrative Management, dated January 12, 1937:

"Our struggle now is against confusion, against ineffectiveness, against waste, against inefficiency. This battle, too, must be won, unless it is to be said that in our generation national self-government broke down and was frittered away in bad management."

The President has directed that all Government Departments, which, of course, includes the Post Office Department, shall reduce expenditures to the minimum, consistent with public need, and in keeping with that objective we have been required to set aside as a reserve a part of the appropriations for this fiscal year with the hope that such reserve might be saved. In looking over the situation it appears to us that we have already accomplished most of the savings that can be effected from the expenditures that are made under contract, and that we must now look to the postmasters and supervisors in the field for such savings as may be secured from better supervision of the personnel.

Everyone in the Department fully appreciates that there has been a steady increase in business. That condition has been recognized and has governed our action in the apportionment of funds for the employment of help. Therefore, most postmasters have had generous consideration, but if we are to do our part in the general program of reduced Government expenditures, it is necessary for every field official to scrutinize more carefully the service under his charge, take prompt steps to eliminate waste, and make no request of the Department for increased allowances until it is determined beyond a doubt that such increases are necessary.

I want you to clearly understand my position in this matter. There is to be no curtailment of existing service. No unreasonable demands are to be made upon the employees, and no one need have fear of losing his job or part of his salary. We are simply striving to secure the full cooperation of all officials and employees. You are the Department's representatives in the field—you are the managers of the establishments in which the work is carried on—and it is therefore through you and by you that we will attain this most important objective.

I have said to the postmasters in many of the State conventions, and I think it will bear repetition to you, that I want commonsense business principles applied in the conduct of the post offices. You must, of course, carry on your work within the scope of the postal laws and regulations and within the limits of expenditures fixed by the Department, but you are given full authority in the assignment of your personnel and you have many opportunities for economy of the right kind. Economy that interferes with good service or penalizes the employees is not the right kind of economy. I shall therefore urge you to follow several definite policies that have been adopted by the Post Office Department under my administration:

The first is: That we shall maintain the service to the public at the highest standard of efficiency;

Second, That we shall maintain a liberal policy in dealing with the employees, and that we shall recognize their rights at all times and do our utmost to provide good working conditions for them;

Third, that we shall make every effort to balance expenditures with income.

I think you understand that neither you nor the Department has any control over the rates of pay or the hours of daily service required of employees in the classified civil service. Those are matters that are controlled by the Executive and Congress. For myself, I am glad to say that I shall be pleased to recommend better wage scales and better working conditions whenever the funds are available. On the other hand, I fully expect that all employees in the service shall be diligent and industrious in the performance of the tasks assigned to them, and that they shall work without complaint and without grumbling.

I feel sure that the Department can count on the wholehearted support of every postmaster in carrying out those policies, and I want each and every one of you who are here to carry this message to your districts and to your States. I particularly want to enlist the very active cooperation of you postmasters who are in charge of the 137 largest offices in the country, where 59 percent of the

receipts are accumulated and 65 percent of the expenditures for supervisors, clerks, carriers, and laborers in post offices are made.

In urging your cooperation at this time I am not speaking for myself alone but am outlining to you the wishes of President Franklin D. Roosevelt, who will go down in history as the greatest humanitarian of our time, and one of the most capable administrators of our public affairs. At the President's request I give you his warmest personal regards and his best wishes for a most successful and happy convention.

May I add that I hope the deliberations of this convention will result in much good to you personally and to the Postal Service.

The best of luck, good health, and success to each of you.

Rural Arts Exhibit of the Department of Agriculture

EXTENSION OF REMARKS

OF

HON. WALTER M. PIERCE

OF OREGON

IN THE HOUSE OF REPRESENTATIVES

Friday, December 10, 1937

Mr. PIERCE. Mr. Speaker, those of us interested in rural life and its opportunities and those Members of Congress who take advantage of the good things which Washington offers have during the last few weeks enjoyed the exhibit of rural arts sponsored by the Department of Agriculture and the land-grant colleges. This very artistically arranged and unusual exhibit has recently come to a close, and I desire to comment upon it and review some of the details which may interest Members and readers of the RECORD. My colleague [Mr. TOBEY] has already called attention to the exhibit, which has now closed. Public interest grew rapidly during the course of the exhibition, which might have had a successful run for many more weeks.

It was indeed a very happy idea to incorporate this exhibit as part of the observation of the seventy-fifth anniversary of the founding of the Department of Agriculture and the land-grant college system. Having been a regent of one of these colleges for nearly a quarter of a century, I should like to take this opportunity to congratulate the Department and the colleges on their splendid presentation of rural arts and crafts. It proved to be an excellent exhibition of the art of the people. Some items were primarily useful, some primarily beautiful, but most of them were both useful and beautiful. In the catalog of the exhibition, art is defined simply as doing well something that needs to be done. That seems to have been the guiding spirit of the exhibition, and it seems to me as sensible a definition of art as I have ever seen. There can be beauty in the objects of everyday life, and whoever wanted proof of that could have found it in this exhibition.

The most surprising thing about the exhibit was the great number of objects assembled from the different parts of the country showing a Nation-wide interest in handicrafts and creative arts. All of the articles in the exhibit were the work of country craftsmen, generally working on native materials. Many of the craftsmen who wrought these things had no more than a meager education—some, I am told, could not even read—yet somehow they mastered useful and creative skills. They developed artistic tastes and manual dexterity and general creative resourcefulness sufficient to stamp their work with quality and distinction and individuality.

Mr. Allen Eaton, of New York, was director of the exhibition. He was formerly from our Oregon University and is now with the Russell Sage Foundation in New York City. Mr. Eaton served with me in the Oregon Legislature, of which he was an outstanding member. He told me many interesting, revealing facts about the people whose works were represented there. I quote herewith some of his statements about the creators of those attractive objects:

One woman, with a nervous break-down, took to making rugs when her doctor ordered her to do something with her hands. She started making hooked rugs. Instead of following the usual conventional patterns, she made a design which pictured the scene from her kitchen window. The result was a beautiful depiction of trees and leaves and a stretch of greensward, too beautiful to be used as a rug. So she hung it on the wall. Then she made others. People with an eye for such things now buy all she can make to hang as pictures on the wall. And the woman, through this new occupation, found a relief from her nervous troubles.

There was a Utah boy who played truant from school to the great distress of his parents and his teacher. Finally, they followed him to an old shack and found him whittling out wooden animals. The teacher had an eye for such things, recognized their merit, and encouraged him to come to school to do his whittling. An exhibit of his carvings was held and they have been admired by many. Now the boy makes progress both in his whittling and in his regular school work.

Another whittler, in this case a Kentucky mountaineer who could neither read nor write, on being asked why he was so devoted to whittling and to the local whittling club, explained that he liked to whittle in the first place and that in the second place a cedar log worth only 15 cents as a fence post grew to $40 in value after being whittled up. Still another whittler in North Carolina has paid 2 or 3 years' taxes entirely from the income brought by sale of carvings of animals made in his spare time.

It is certainly true that the excellence of the articles on display was very marked. Most of us who were there learned things we had never even suspected about our native country arts. I believe now that our continent-wide Nation must have in it a richer variety of folk art and country art than any other nation, and I think all of us should learn more about the possibilities of artistic representation in the articles of common use.

These country arts have an economic value. Many farmers practice a craft during the slack seasons and thus increase their income. In regions where the agricultural resources are not rich some farmers have found that by the exercise of a craft they can add appreciably to the family income. Thus, small potteries, cabinet shops, and such, have sometimes sprung up where the soil was thin. Sometimes country families have been able to make for themselves objects of necessity or of luxury for which their limited cash could never have paid. Many whose regular jobs have been cut away by depression or by technology have rehabilitated their whole life through the practice of a handicraft.

But there are other values than economic values in this life. It is these other values that the country arts chiefly serve. They provide a vehicle that is accessible to great masses of the people for expression of a creative urge that all of us to some extent share. We cannot all be great painters or sculptors or poets or musicians. But all of us have something in us that finds satisfaction in one or another of the arts. He who cannot draw nor carve nor write may yet have the latent skill to construct an excellent chair or weave a basket. Thus these forms of popular art encourage by their wide diversity the important principle of participation. They offer an outlet to a wide variety of skills and talents. By doing so they foster active participation instead of mere admiration. A society of doers is far healthier than a society of watchers.

Again I quote the director of the exhibit who has given so much thought to the subject of creative art, especially in its relation to rural life.

I believe this touches upon a criticism of our civilization that has been expressed elsewhere. Athletics, for instance, are enjoyed by most people from the grandstand, yet the real virtues of athletics affect only the athletes. There is no reason why we should not all enjoy music performed by others, yet I wonder if there isn't more real good in figuring out for one's self a faulty rendition of a Chopin nocturne than in hearing the most perfect rendition. These country arts invite wide participation, and for that reason alone they seem worth while.

Another thought that occurs to me is that since this is native art employing principally native materials it may develop to an increasing extent native and peculiarly American themes. I have the impression that great national art has in the past derived its themes and its most distinctive character from folklore and folk ways. I wonder, therefore, if these genuinely native arts may not possibly develop characteristics that will influence the so-called higher forms of art. This may be only idle speculation, yet the fact remains, I believe, that no art is more real nor more genuine than this country art. We need go no farther to learn that a piece of pottery, if it be good, must not only hold water but must please the eye as well.

This sort of art is neither idle nor frivolous. It is worth the sober attention of the most serious-minded. It is a matter that concerns human welfare, and I think none of us is so materialistic

as to believe that we can approach human welfare only from the political or economic angle. We have always recognized the beneficence of religion. I see no reason why we should ignore the cultural approach to problems of human welfare.

In order to give some idea of the scope of the exhibit, I desire to incorporate in this brief statement a summary of the kinds of items which were shown:

Ranged in orderly profusion around the four walls was an infinite number of objects various enough in nature to appeal to all tastes. There was pottery of many kinds, from vases large enough to hold a small child to tea sets of fine delicacy. Invariably the coloring and glazing and general craftsmanship were of the highest quality. There were wonderful examples of home spinning and weaving, linen tablecloths, napkins and towels, blankets and coverlets of wool. One very handsome woolen blanket was the product of a single pair of hands, from the raising of the sheep through the growing and preparation of the vegetable dyes to the final weaving. There were neckties made of homespun handsomer than any silk. There were some good old-fashioned knitted mittens of the kind that really keep your hands and wrists warm. There were baskets of every shape and size and description which were fit to serve any use that any basket ever served; each one was tasteful, handsome, and symmetrical. There were hooked rugs and hand-stitched quilts of infinite complexity and beauty. Whittlers were represented by carvings of animals and by small statue portraits of people that seemed excellent art. There was a round-up of over a hundred range horses whittled out of chips by a Montana cowboy, and a very handsome strong ox yoke carved out by I don't know who. There were many wooden products of the lathe and some excellent pieces of furniture, chairs, tables, and odd pieces of various sorts. There were examples of fine handwork in the metals, principally iron and brass. Among the most interesting items in the whole exhibition were sets of harness of good quality made by Negro farmers of Texas, who cured and tanned the leather and made everything except the rivets and metal parts, which, I understand, they had to purchase off the farm. The State of Texas also contributed a full pantry of canned foods that would tempt any natural appetite—boned chicken, vegetables and fruits of all kinds, jams, jellies—enough to feed an average family through a winter. There are many of these model 4-H pantries in the homes of Texas farmers. There was a roadside stand so pleasing to the eye, with its products so artfully arranged, that few motorists could pass without stopping to buy. There were almost innumerable other items: A collection of homemade musical instruments, a menagerie carved from peach stones, a 20-foot chain whittled from a single piece of wood, little figures made from corn husks and grasses, handsome glassware, and a hooked rug and quilt almost as old as this Nation. There were articles or photographs on display from every State, Territory, and possession.

It is clear that the Department of Agriculture deserves public congratulation for its recognition of the rural arts and crafts. Through this exhibition it has opened the eyes of a lot of us, first of all, to the really worthy nature of these country arts, and in the second place, to the human values which they foster. Mr. Eaton and his associates deserve high praise for their work. The arrangement of the articles on display was a work of art comparable to the articles themselves. If the continued recognition and development of the country arts could profit thereby—and that certainly should be the case—it would be well worth considering making such an exhibition a permanent, or at least a regular, affair. Thus more and more people who know nothing of these arts could be given some acquaintance with them. Once known, they are almost universally appreciated. The result would probably be to increase the demand for the excellent products of these crafts, and the independent craftsmen who make them would reap the reward of which lack of recognition alone deprives them. I can imagine no more wholesome and satisfying channels into which spare-time energies and interests could be directed. If public interest mounts as it seems capable of doing that enthusiasm would be very encouraging.

In aiding or encouraging vocational education, several Federal agencies have fostered the arts and handicrafts. This is a worthy cause and I hope that efforts in this direction will be increased. The Department of Agriculture, particularly in the work of its extension service, has long recognized that it can serve our country people well by giving attention to the cultural as well as to the economic phases of rural life. I believe we have much yet to learn, but gradually we are all learning that there are new approaches to the problem of public welfare.

The exhibition of country arts seems to indicate that the Department of Agriculture is alive to the fact that it must serve an infinite variety of country interests. It was a good job and congratulations are in order. But I hope that this was more a beginning than an end, more a promise than a fulfillment. I hope that the Department will see fit to perpetuate and to extend such activities, and to investigate still other means of serving the human and personal welfare of our agricultural communities. We have all been a little too immersed in purely economic matters. The Department of Agriculture, for all its proper concern over wheat, has shown that it knows that man does not live by bread alone.

I cannot close this notice of inclusion of the arts in the Department's anniversary celebration, without mention of the delightful evening of American folk music which was a notable contribution.

I venture to suggest also that citizens of Washington might well add to its art galleries a permanent exhibit of the art which has sprung from the rural life of our country. It is really art, and it is indigenous to our soil. The thousands of people who visit Washington each year would be stimulated to emulation, and the effect would be felt throughout the country.

Wage and Hour Bill

EXTENSION OF REMARKS

OF

HON. MICHAEL J. BRADLEY

OF PENNSYLVANIA

IN THE HOUSE OF REPRESENTATIVES

Friday, December 10, 1937

Mr. BRADLEY. Mr. Speaker, under unanimous consent which I have received, I am extending my remarks and including therein a communication from the Philadelphia Chamber of Commerce, in which opposition is expressed to the pending wage and hour legislation, and my reply thereto, in which I have informed them of my position on this bill and the reasons why I intend supporting this legislation:

PHILADELPHIA CHAMBER OF COMMERCE,
Philadelphia, November 27, 1937.

Hon. MICHAEL J. BRADLEY,
House of Representatives, Washington, D. C.

MY DEAR CONGRESSMAN: One of the most disturbing factors in the present business and employment situation as you must know is the threat of the pending Federal wage and hour bill itself. Equally disturbing is the apparent disposition of a small group to bring forward this revolutionary piece of legislation even before the Labor Committee itself has been able to come to any clear agreement as to its major provisions, and when large elements of labor and the public as well as of business are so solidly opposed to it.

The enclosed editorial from yesterday's New York Times, in our opinion, presents facts that no citizen, certainly no far-sighted Congressman, can overlook.

On behalf of the great volume of employment, pay rolls, and human welfare represented by the membership of the Philadelphia Chamber of Commerce, I therefore urge you either to withhold or withdraw your signature from the petition to bring out this ill-conceived bill until it has at least been thought through, and to use all your influence to induce your colleagues to do likewise.

Very truly yours,

GEORGE W. ELLIOTT, *General Secretary.*

CONGRESS OF THE UNITED STATES,
HOUSE OF REPRESENTATIVES,
Washington, D. C., December 9, 1937.

PHILADELPHIA CHAMBER OF COMMERCE,
Twelfth and Walnut Streets, Philadelphia, Pa.
(Attention of Mr. George W. Elliott, general secretary.)

GENTLEMEN: I have before me your letter of November 27, which I was unable to answer sooner due to pressure of business here in Washington opposing the enactment of the minimum-wage and maximum-hour bill.

Frankly, I cannot understand why you should oppose legislation of this kind, particularly as the representative body of the business interests of our city. We in Philadelphia have need of this legislation more perhaps than any other section of the country to protect our industries from the low-wage scale prevailing in other parts of the United States. In my own particular district—indeed, in my own community, in the Kensington mill district—there has been an exodus extending over a period of years and continuing right up to the present time of industries which furnished employment to thousands of our people and which have moved to

localities in order to take advantage of substandard labor conditions and a lower wage scale. In my humble opinion, if the Philadelphia Chamber of Commerce was alive to the real interests of our city it would be among the foremost advocates of this legislation, as it is particularly designed to protect manufacturing industries in Philadelphia from competition with industries located in other localities where low wage scales prevail and where long hours are the rule rather than the exception. No one can deny that these industries have left Philadelphia for other localities, as our vacant mills offer indisputable evidence of what has taken place. If you can explain to me why I should favor continuance of conditions which have forced these industries, especially in the textile field, to move from Philadelphia, I will be glad for you to do so. Indeed, the pending bill, in my opinion, does not go far enough to afford Philadelphia the protection against these conditions, which should be evident to all who reside in our city, but it is, however, a step in the right direction in an effort to afford some protection to our people against indefensible labor conditions prevailing elsewhere.

The minimum wage proposed by the bill is $16 per week for a 40-hour week. I wish the pending legislation were more definite in this regard, so that there would be no exceptions from this wage scale. No one, I think, can publicly maintain that $16 a week is an exorbitant wage for an American adult to receive as a minimum wage. No one can maintain that an American citizen can provide even the bare necessities of life for his family on $16 a week. For anyone to oppose a minimum wage of $16 a week, to me indicates that they are either misinformed or insensible to the hardships imposed upon American citizens who are compelled to eke out a miserable existence. For anyone to say that a minimum wage of $16 a week would disrupt industry, particularly in our city, seems to me fantastic, and I think any fears in this respect are unfounded and have no basis in fact. I certainly, both as a citizen and as a Member of Congress, cannot subscribe to such philosophy, and, frankly, I do not understand why any business organization in Philadelphia should oppose a measure which is designed to correct existing evils in other localities and to remove the incentive which has prompted so many business concerns to move from Philadelphia and has left our mills idle and our people without employment, and has resulted in the deterioration of the business life in our local communities.

Only this week a Philadelphia newspaper whose political policy is in opposition to the administration here in Washington in its editorial column conceded the need for such legislation insofar as our own interests were affected.

I feel that if you reexamine the whole question that you probably will agree with me that there is nothing Philadelphia has to fear from this legislation, but that it can be productive of a great deal of good.

Very truly yours,

MICHAEL J. BRADLEY.

Frank "I Am the Law" Hague Fights Labor

EXTENSION OF REMARKS

OF

HON. JERRY J. O'CONNELL

OF MONTANA

IN THE HOUSE OF REPRESENTATIVES

Friday, December 10, 1937

CORRESPONDENCE BETWEEN 26 MEMBERS OF CONGRESS AND MAYOR HAGUE, OF JERSEY CITY, N. J.

Mr. O'CONNELL of Montana. Mr. Speaker, under leave to extend my remarks, I wish to state that the exchange of correspondence between 26 Members of this House and Mayor Hague, of Jersey City, and myself, which I herewith submit for the RECORD, has a significance far beyond that which Mayor Hague attempts to give it.

FRANK HAGUE, THE KIDDER

The mayor of Jersey City, whose name has become a byword in every thoughtful American household for a kind of political control which has brought disrepute to the term "politician", attempts to pass off our questions by wisecracking. He would have us descend to the sleazy level of barroom and race-track kidding in which he finds himself most at home. But Frank Hague's attempt to draw us down to his back-slapping standard of discussion does not take us in.

"I AM THE LAW" HAGUE

His conduct in recent labor attempts to organize in Jersey City is symbolic of the most insidious kind of effort to undermine our democratic form of government. I am not in the least concerned with Frank Hague personally. I am concerned only with the fact that over the years he has attained a power in Hudson County, N. J., which he is now abusing in a sinister manner. In this morning's New York Times there appears a picture of Mayor Hague with the following caption under it: "I decide, I do, me, right here," says Hague. This statement was in answer to the question put to him as to who decides whether efforts to organize Jersey City workers constitute "an attempted invasion." In other words, Mayor Hague sets himself up as a miniature dictator, defying not only all decent citizens but denying the existence of our Bill of Rights, and, as Secretary Ickes observes, "parroting Louis XIV's 'I am the law.'"

A NATIONAL, NOT A LOCAL PROBLEM

It would be bad enough if Mayor Hague had no influence beyond the confines of his city and county. But he has extended that influence to embrace much of the State of New Jersey. Moreover, as a member of the Democratic National Committee, he is a factor in the councils of the party to which I belong. His effect is, in short, great enough to be cause for serious national concern.

BILL OF RIGHTS MUST BE PRESERVED

I am not here interested, one way or another, in what labor organization or organizations are attempting to organize the workers in and around Jersey City. The C. I. O. happens to be in charge of the present laudable effort. I am only insisting—and I believe I reflect the attitude of an overwhelming majority of this legislative body—that these labor organizers have a right to attempt to bring their fellow workers together in an effort to improve their working conditions and standards of living. This right is inherent in our constitutional Bill of Rights. It has been specifically expressed as the will of Congress in a number of legislative acts, typified by the Wagner Labor Relations Act and the Norris-LaGuardia Anti-injunction Act.

MEN, WOMEN, AND CHILDREN EXPLOITED

In a State where 34,000 employed women and children receive less than $5 a week and where 292,000 receive less than the never-enforced $17 State minimum wage, Mayor Hague's efforts to block labor organization takes on an added implication. Only a few days ago Edward J. Flynn, supervisor of the minimum-wage division of the State labor department, declared that factory pay rolls in a number of New Jersey localities average as low as $7.40 a week.

There is a minimum cost of living—

He asserts—

necessary to maintain human beings at a certain standard. Living below that level they become moral and physical menaces to society.

Whenever any personal organization employs human beings for the purpose of making a profit on their labor and pays them less than an amount sufficient to sustain the moral and physical strength necessary to do the work expected from them, it is self-evident that society is paying at least a part of the employer's labor bill.

SOCIETY PAYS INDUSTRY'S BILL

The mayor of Jersey City and others like him are endeavoring to perpetuate the system under which society itself is being undermined by having to pay a large part of the employer's labor bill. Though the mayor's brazen effrontery in violating every American tradition of decency is such that financial and industrial leaders do not dare openly to applaud him, there is little doubt that he receives their secret approval and support. The history of his political machine makes it abundantly evident that his power and effectiveness have been built on an exchange of favors which no self-respecting American citizen would tolerate.

CIVIL LIBERTY FLAGRANTLY VIOLATED

The mayor's chief of police testifies under oath that the police have the right to eject people from the town. People have, in fact, been so ejected by being forcibly placed on ferryboats, tubes, or even driven out in their own cars. Residents of the city itself have thus been ejected. Hall owners have been terrorized so that they are afraid to rent their halls for meetings. Picketing is permitted only after Hague's police decide that the union is bona fide.

Illegal searches and seizures without warrant of court are perpetrated, apparently with impunity. Papers of labor organizers are actually stolen by the police. Organizers, day and night, are trailed by Hague detectives. Counsel for the organizers seriously assert that some of them have actually been kidnaped by police and plain-clothes men under Hague's direction. Bail is illegally denied if the organizers are arrested. In short, the picture is one of complete abrogation of every standard of civil rights we, as citizens, have been taught to cherish.

DICTATORSHIP OR DEMOCRACY

As I said before, I am not entering upon this attack on the mayor of Jersey City as a person. I am engaging in it with the unremitting intention of trying to help arouse the American public to the importance of Mayor Hague's conduct as a symbol of what is happening, not only in New Jersey, but in other sections of the country. The Civil Liberties Committee of the Senate, chairmaned by Senator LA FOLLETTE, of Wisconsin, has spread before the people of this country the corrupt and un-American tactics used by too many of our American employers in trying to prevent the organization of labor. In the case of Hague's machine, as in the case of other political machines in important industrial areas, the employer does not show his hand. The machine does the work for him and whole populations are so terrorized under the threat of insecurity in their jobs, that they become abjectly cowering individuals, ashamed to lift their heads and look squarely at the situation in which they find themselves. The trend in this country toward local dictatorships under the impetus of labor's awakening and attempt to organize itself is so marked that many thoughtful observers foresee the development here of the dictatorship pattern which has been followed in European countries.

HAGUE AND HIS TRIBE MUST GO

Our job as true representatives of our constituents is to aid in arousing them to a realization of the imminent danger confronting them. I have faith enough in the American people to believe that if they are informed of the insidious program of political machines such as Hague's, they will rise up in their voting strength and throw off the yoke under which they become mere slaves. Labor's Non-Partisan League, composed of all elements of labor, including C. I. O., A. F. of L., and railroad brotherhoods, is of the same opinion and is doing yeoman service in that direction.

LABOR HATERS EMPLOY OLD TRICKS

Mayor Hague, like all of his type, turns on the labor movement which threatens his power, and says that it is communistic and un-American. That has for many years been the trick in mass psychology played by financial and industrial interests fearful lest they lose some of the dividends and accompanying power which they have achieved, in large measure, at the expense of their workers and the workers' families. To say that these big interests are blind in not recognizing that their only hope of survival in the long run is the spread of purchasing power among the mass of the working population, does not answer the immediate problem.

CIVIL LIBERTY MUST BE PRESERVED

These interests undoubtedly will accept the promises of dictators as they have in Europe, dictators who guarantee to protect their property for them against rising demands of the working population for enough of the material necessities of life to maintain themselves as decent, self-respecting citizens. Our only hope in averting a similar period of degradation under dictatorship in this country is the acceleration of labor organization and, with it, the increase of awareness by the laboring multitude that the preservation of our democratic processes lies in their hands and in the hands of the middle classes, whose interests are, in fact, closely tied to those of labor.

As requested by Mayor Hague, I am inserting the correspondence involved:

LETTER OF 26 CONGRESSMEN

DECEMBER 4, 1937.

MAYOR FRANK HAGUE,
Jersey City, N. J.

DEAR MAYOR HAGUE: Newspaper accounts of recent events in your city, connected with an attempted labor organizing drive, raise serious questions in our minds. On the face of these accounts, it appears that officials of your administration, acting under blanket orders, are denying labor organizers the rights guaranteed to them by our Constitution and by the expressed will of Congress, exemplified by such measures as the Wagner Labor Relations Act and the Norris-LaGuardia Anti-injunction Act.

We have not had an opportunity to investigate the facts at first hand, but the reports concerning them appearing in our press are sufficiently disturbing to move us to ask you for your version of the situation.

We refer specifically to the wholesale arrest and deportation from the city limits of organizers, both resident and nonresident in your city, seeking to organize the workers in various industries in that region.

We call your attention to the speech delivered by President Roosevelt on Constitution Day, in the course of which he said, referring to the world threat of dictatorship:

"I believe that democratic government in this country can do all the things which common-sense people, seeing that picture as a whole (social-economic picture), have a right to expect. I believe that these things can be done under the Constitution, without the surrender of a single one of the civil and religious liberties it was intended to safeguard.

"Nothing would so surely destroy the substance of what the bill of rights protects than its perversion to prevent social progress. The surest protection of the individual and of minorities is that fundamental tolerance and feeling for fair play which the bill of rights assumes. But tolerance and fair play would disappear here, as it has in some other lands, if the great mass of people were denied confidence in their justice, their security, and their self-respect."

In addressing this communication to you we are not interested in any organization or organizations, as such, to which the labor organizers referred to above may belong. We are concerned solely with the fundamental question of whether these people are being denied the rights to which the President referred in his Constitution Day speech.

We will appreciate an early reply from you to this inquiry.

Yours sincerely,

Signed by: John M. Luecke (D.), Michigan; Hugh M. Rigney (D.), Illinois; Matthew A. Dunn (D.), Pennsylvania; Jerry J. O'Connell (D.), Montana; John T. Bernard (F. L.), Minnesota; John M. Coffee (D.), Washington; Knute Hill (D.), Washington; Thomas R. Amlie (P.), Wisconsin; B. J. Gehrmann (P.), Wisconsin; Gerald J. Boileau (P.), Wisconsin; Gardner Withrow (P.), Wisconsin; Harry Sauthoff (P.), Wisconsin; William Lemke (R.), North Dakota; Maury Maverick (D.), Texas; Herbert S. Bigelow (D.), Ohio; Byron N. Scott (D.), California; Robert Gray Allen (D.), Pennsylvania; Jerry Voorhis (D.), California; Kent E. Keller (D.), Illinois; Ed. V. Izac (D.), California; Frank W. Fries (D.), Illinois; Henry G. Teigan (F. L.), Minnesota; Usher L. Burdick (R.), North Dakota; George Schneider (P.), Wisconsin; Robert Ramspeck (D.), Georgia; Herman Kopplemann (D.), Connecticut.

MAYOR HAGUE'S LETTER

OFFICE OF THE MAYOR,
City Hall, Jersey City, N. J., December 8, 1937.

DEAR JERRY: Your kind letter of the 4th received. I am very happy to know you have been thinking of me. My regards to your 25 associates who also have gone to the great inconvenience of communicating with me. I can assure you that everything is under control.

There is nothing for you to be disturbed about that I can see. The people of my city feel as I do; they are very grateful for your interest.

Give the boys my regards. If I do not catch up with you before then I will look forward to meeting you at the 1940 convention, when we will have plenty in common.

So, until then, good-bye and good luck. Leave everything to me and don't worry.

Very truly yours,

FRANK HAGUE.

P.S.—Because of the importance of this communication, and because I feel that it will be very beneficial to you and your 25 associates in their respective districts, I would suggest that you have it inserted in the CONGRESSIONAL RECORD.

A REPLY TO HAGUE

MY DEAREST FRANKIE: Thanks for your reply to our letter. It confirmed our worst fears about you. In spite of those fears, we took a chance that you might rouse yourself from the miasma of machine politics in which you have your being and try to answer the important questions we put to you. But you're apparently still incurable and can't summon enough intellectual or other fortitude to face any issue squarely.

We note that you say labor is "under control" in your city. Knowing something about your methods of operation, we're not

surprised that you think it is. You've gotten away so long with profitable conniving between your machine and corporate industrial and financial interests that you can't imagine your "control" ever coming to an end. Though the slogan on your letterhead inviting industry to locate in your city doesn't spell out your promise to industrialists and financiers to keep labor there from ever being effectively organized, it might just as well. You don't care at what low levels the workers in your city are kept. But, Frankie, you've got a rude awakening ahead of you. You ought to get hep to yourself and recognize the handwriting on the wall.

Your letter is just a supposedly kidding variation of your frequent assertion that "I am the law in Jersey City." That, of course, is a pale imitation of Mussolini and Hitler. But it's something you better not try to kid about any longer, Frankie. American citizens both inside and outside your city won't take it as a slick politician's joke. The great majority of them agree with the President's Constitution Day speech.

Before closing we want to tell you we may not see you in 1940, as you suggest, because we'll see you in 1938 and you may not feel securely genial enough to be around much after that. But we'll go on seeing you just as long as it takes to help end the type of control you exercise—a type that makes a mockery of our best American traditions, exemplified and expressed by such leaders as Washington, Jefferson, and Lincoln.

Oodles of love and kisses.

Yours truly,

JERRY J. O'CONNELL.

Fair Labor Standards Bill

EXTENSION OF REMARKS
OF
HON. ARTHUR D. HEALEY
OF MASSACHUSETTS
IN THE HOUSE OF REPRESENTATIVES

Friday, December 10, 1937

COMMUNICATIONS FROM THE NATIONAL CONSUMERS' LEAGUE

Mr. HEALEY. Mr. Speaker, under the leave to extend my remarks in the RECORD, I include the following communications:

NATIONAL CONSUMERS' LEAGUE,
New York, N. Y., December 9, 1937.

DEAR MR. HEALEY: The National Consumers' League has been watching closely the fair labor standards bill. Since action on this bill next week is likely, we feel that the point of view of a nonpartisan organization that has long experience in labor legislation will be valuable. We therefore wish to submit to you briefly our recommendations.

Sincerely yours,

MARY C. WING,
Secretary of Legislative Committee.

DECEMBER 9, 1937.

RECOMMENDATIONS BY THE NATIONAL CONSUMERS' LEAGUE ON THE FEDERAL FAIR LABOR STANDARDS BILL

The National Consumers' League has for 40 years worked for legislation in the field of minimum wages and maximum hours. Federal legislation is now a legitimate means of maintaining the standards set up by State legislation and of eliminating substandard labor conditions throughout the country. In consequence we believe in the principle of the fair labor standards bill. Our recommendations are to be taken with this in mind; they are aimed at the improvement of the bill and are not to be construed as favoring its elimination or the substitution of a new bill.

The league offers the following recommendations to the bill:

1. ADMINISTRATION

The bill should be administered by the United States Department of Labor, working through State labor departments, where adequate ones exist; or by direct Federal enforcement in States where such departments do not yet exist and until they are functioning adequately. This method of administration has worked well in regard to the Walsh-Healey Federal Contracts Act. The creation of a separate board would cause complication and reduplication of functions.

2. CHILD-LABOR PROVISIONS

The child-labor provisions of the bill should be isolated in one section with its own list of exemptions to prevent the application to children of all the general exemptions. The administration of the child-labor provisions by the Children's Bureau and the method of enforcement advocated by the House Labor Committee amendments are supported. Such methods of enforcement as those included in the Wheeler-Johnson bill are unworkable. Provision should be made to prohibit industrial home work for children.

3. MINIMUM-WAGE AND MAXIMUM-HOURS STANDARDS

The fixing of a definite minimum wage or maximum hours in the bill would be unfortunate, in that conditions in different industries vary so widely. Flexibility of these features would prevent unnecessary hardship and the creation of prejudice against the bill as a whole.

PEPPERELL MANUFACTURING CO.,
Boston, Mass., December 6, 1937.

Hon. ARTHUR D. HEALEY,
House of Representatives, Washington, D. C.

DEAR MR. HEALEY: The cotton textile industry is, as you know, in a serious condition. It is a condition which requires prompt correction. In every State, wage earners are either out of work entirely or working on a 2- or 3-day-a-week schedule.

In view of the fact that one of our plants is located in Massachusetts, and knowing that you are very keenly interested right now in this problem, I thought you would be interested in seeing a copy of a letter which I have written to the president of the Cotton Textile Institute, Inc., which I enclose herewith. I am sending a copy of the letter to the Governors and to Senators and Congressmen from all States in which our company has plants.

Very sincerely yours,

RUSSELL H. LEONARD, *President.*

PEPPERELL MANUFACTURING CO.,
December 3, 1937.

DR. CLAUDIUS MURCHISON,
President, the Cotton Textile Institute, Inc.,
Washington, D. C.

DEAR MR. MURCHISON: It seems to me that our industry has right now a great responsibility. It has also the best opportunity it has ever had to correct the fundamental abuse which is contributing more than any other factor to its continuing uncertainty and wretchedness.

No one who has studied the industry and whose vision is at all clear has failed to realize that the productive capacity of cotton textiles and rayons on three 40-hour weekly shifts is completely out of relation to any conceivable demand. On this basis there are still, at least, ten or more millions of surplus spindles. Does the industry propose to continue on through another 10 years of depression while these spindles are being junked? Of course, no one in his senses would look forward to such a period except with despair. And yet this will happen inevitably if the unregenerate, chiseling minority are permitted to continue their selfish ways.

Besides being an economic monstrosity, the midnight to sunrise shift is, to say the very least, not a pleasant or healthful occupation for anyone. Especially is it of positive harm and danger to the health of women.

Our industry should assemble its enlightened membership, I believe, and insist upon a law passed now in the present Congress, as part of the wage and hour bill, or separately, which will wipe out unequivocably and for all time this injudicious, disgraceful, uneconomic practice which a small minority must inevitably force on everybody who desires to remain in business.

According to my view, the institute will never find a finer purpose for its leadership and its accomplishment would justify the existence of the institute for years to come.

With regards,

Faithfully yours,

The Farm Problem

EXTENSION OF REMARKS
OF
HON. RALPH O. BREWSTER
OF MAINE
IN THE HOUSE OF REPRESENTATIVES

Friday, December 10, 1937

Mr. BREWSTER. Mr. Speaker, the farm problem now resounds throughout the country and through the Halls of Congress. A down-East Yankee may well ponder its significance.

The problem seems to have arisen because the farmer has ceased to live upon his farm. Specialization in all phases of our complex economic life has finally reached the farm. Those who devote their land and their resources and their energies to the production of a single crop without raising their other means of subsistence find themselves in an increasingly precarious position.

This is particularly true throughout the South.

The farm bill now before the special session of the Congress, summoned by the President of the United States, is especially designed for certain crops and certain sections. The South has faced a terrific challenge in the gradual elimination of the foreign markets for its cotton which formerly consumed approximately one-half of the southern cotton crop. Whether or not the agricultural policies of recent years have helped or hindered the disappearance of the foreign markets for southern cotton, the fact remains that cotton production in other competing countries has been tremendously increased, and particularly in certain new areas, such as Brazil, where tremendous plantings are taking place.

During the past 5 years our cotton exports have decreased from 8,000,000 to 4,400,000 bales, and during the same period foreign production of cotton has increased from 10,000,000 to 20,000,000 bales.

These facts tell the story of the crisis in the South.

In seeking a solution of the difficulties that shall at least temporarily ameliorate the impact of this terrific loss of foreign markets, certain cotton interests have formulated a program and enlisted the cooperation of producers of wheat and corn in other sections, and incidentally have cooperated with their neighbors in the South to introduce tobacco and rice in the formulation of the bill which is now before the Congress.

The inclusion of rice is significantly of its southern origin, as this crop is produced exclusively in the South, although its commercial importance in comparison with other agricultural crops is negligible.

Rice is produced only in the four States of Arkansas, Louisiana, Texas, and California, but here again it is interesting to note that 43 percent of this production moves either to foreign countries or to Hawaii, Alaska, and Puerto Rico.

The total value of the rice crop of the United States last year was only $40,730,000. This is about one-fifth the value of the United States potato crop in any normal year.

POTATOES

Potatoes are normally the fourth food crop in value in the United States. They are a staple article of diet in the food of everyone in the United States, rich or poor. The United States is entirely able to produce all the potatoes that are required in this country without foreign importations of any kind.

It is for this reason that the action of the State Department in reducing the tariff on potatoes imported from foreign countries under both the Cuban and Canadian trade agreements has been puzzling in the extreme.

The competition between growers in the United States is such that anything suggesting a monopoly is ridiculous, since potatoes are produced in every one of the 48 States, and the slightest suggestion of a shortage immediately stimulates production to ruinous heights.

It is to be remembered that potatoes are planted in every month in the year in some section of the United States and are also being harvested practically every month in the year, with the result that production readily adapts itself to demand.

Potatoes have now been declared a basic commodity and are entitled to whatever prerogatives that may accord them under the Warren Potato Act. Potatoes are also entitled to benefit along with all other crops without discrimination under the provisions of the Soil Conservation Act—the provisions of which are not repealed by the present legislation.

POTATO GROWER PREJUDICED
